To be actually near to a person, you must be able to gather threads from the personality of that one and be able to weave them into the loom of your own ever-weaving tapestry For, in a very large measure, we are of the substance of numberless human strivers. Like the well-remembered rag rugs of our youthful days, that were composed of hundreds of shreds from here and there, this character and personality of ours is a combination of the shreds of human thought and character that we have picked up, through nearness to others, and made a part of all that we are.

We get nearest to people in silence. Silence emigrates. And in so doing it whispers something to the soul in secret session. That's when we may be said to be near to another.

We are near to people in sorrow, when words fail us, and only ourselves radiate to the heart of the stricken one. We are nearest to ourselves when we come to see our faults and virtues as though naked. And we are nearest to God when our prayer is beyond utterance.

Our nearness to Nature is evident when every flower, every wave of a leaf, and every movement or spectacle in Nature affects us as though intimate with our very thoughts. Like the song of the forest, or the smile of a flower, or the confidence of a wild beast. For example, when Alexander Smith wrote that "the tea-urn purrs like a fondled cat," and that Prometheus was "roofed by the keen crystals of the stars," he was expressing his intimacy with elements, foreign only to those who could not feel their nearness.

Getting near to things, or to people, is but another way of expressing nearness to richness, and to rarity. We get near to the truth of immortality if we see the significance to every fall of golden leaf at this autumn festival.

USDA Reveals Deadliness of Cholera As Threat to Pork Supplies

Need for taking better care of hogs in order to protect them against deadly cholera and assure adequate pork supplies was stresed recently by the U. S. Department of Agriculture when it disclosed the results of scientific research which show how fatal the disease is.

The Department points out that three of its scientists have found that even the smallest fraction of a drop of hog cholera virus can kill a hog that is not protected by anti-hog-cholera serum. This confirms what many white and colored farmers have learned from the bitter experience of seeing one hog and then the entire erop wiped out by this dreaded swine disease.

Inoculation of hogs with virus and serum together in proper doses builds up a good immunity that protects them against this deadly disease. Serum alone produces only a temporary immunity, and virus alone, of course, is fatal even in very small quantities. It is pointed out that because this virus is so deadly, healthy pigs should be separated from sick ones. And each crop of pigs should be inoculated with serum and virus about weaning time.

The Department of Extension Service says that many of the white and colored county agricultural agents spend a large part of their time helping farmers inoculate their hogs against cholera in communities where there are no veterinarians.

Agent O. S. O'Neal, founder of the famous Fort Valley Ham and Egg show says that one year a colored farmer may place as many as 20 well cured hams on exhibit, and the next year may not have a single ham because cholera has wiped out every pig in his pen.

The Department scientists also found that blood from cholera infected pigs contained the most virus during the period between the sixth and eighth day from the time the pigs become infected. Department officials aay that this finding is a warning to dispose of cholera sick pigs as soon as posible in a safe manner and then burn their bedding and disinfect the premises they have occupied.

It is pointed out that sanitation, proper feeding, and good care are the first steps toward prevention of swine diseases.

CIVILIANS TO GET MORE BUTTER

Fifty percent more butter will be made available monthly to consumers during the next four months than has been available this year, the U. S. Department of Agriculture announeed last week in connection with its sales plan to return nearly 100 million pounds of butter to civilian trade.

Prior to the war, U. S. eivilians received an average of 150 million pounds of butter monthly. During the next four months, it is expeeted that 135 million pounds will be available monthly.

Farm Woodlots Can Help South Improve Rural Slums

With two-third of the farmhouses in the South needing either rebuilding or repairing in the face of high prices and short market supplies of lumber, Forest Service of the U. S. Department of Agriculture points to farm woodlots as a source of timber for farm construction and repair work.

According to the 1940 census, colored farmers in the South have over eight million acres of woodland on their farms. About half of the acreage is held by colored owners, the rest by tenents. However, it is pointed out that thousands of colored farmers, especially tenants, live in slum housing.

Forest service officials say that home use will give Southern farmers the best value for their timber and suggest that farmers make the biggest savings when they harvest the timber and do the repair work themselves, using other native materials such as sand, gravel, and stone.

It is pointed out that some white and colored farmers in the South already are taking advantage of their home grown timber supply to rebuild and repair their farm houses. In a few communities farmers have come together and formed cooperatives to establish small sawmills.

Under the leadership of Emmett A. Randolph, colored county agent of Fayette County, Texas, ten colored farmers formed a sawmill co op about four years ago With the mill, they have not only cut enough of their timber to repair their own farmhouses and those of their neighbors at a small profit. but also, in some cases, have built new houses, including an extention demonstration building.

For the construction of the extension building, the farmers cut 16,000 feet of lumber and 25 squares of shingles. The county provided $650 to cover such costs as mill work, cement, hardware, window sash, and other materials not obtainable from the farm. When construction was completed they had a building valued at 3,000. It houses a model kitchen, farmers' county council meeting room, a blacksmith shop, and offices for the two extension agents.

Details on building procedure and costs are given in a new USDA bulletin, "Farm Buildings from Home grown Timber in the South." The author points out how some plantation owners have used home-grown timber to improve their tenant house. how some groups have built schools, and how many farmers have rebuilt or repaired their farm home and farm buildings

The bulletin suggests ways of harvesting and milling logs, and drying green lumber. A chart is given which lists the more important Southern trees, and gives size and specifications for the various uses to which the lumber may be put. A copy of the bulletin (F. B. No. 1975) may be obtained from the Forest Service, U. S. Department of Agriculture, Washington,

USDA EXHIBIT AT ANNUAL WORKSHOP OF WOMEN'S COUNCIL

An exhibit on food and family feeding was made available to the National Council of Negro Women for its annual workshop by the U. S. Department of Agriculture. The workshop was held October 30, 31 in the auditorium of the U. S. Department of Labor.

Among other things, the exhibit material covered food problems of consumers, the school lunch program, and industrial feeding. The latter included display panels which showed how the Department has encouraged many industrial plants to shift their emphasis from choices of well known foods in their cafeterias to foods whieh contain the greatest amount of nutrition. Mrs. Constance E. H. Daniel, USDA information specialist, helped select the exhibit material.

Achievement in 4-H Club Work in Georgia

1. J. B. Clarington of Peach County is one of the four outstanding 4-H Club boys of the State. It is announced that he will be awarded one of the four $25.00 prizes given by the "Bankers Health and Life Insurance Company" of Macon, Georgia. This company has been encouraging Negro 4-H Club work in co-operation with the Georgia Agricultural Extension Service for a number of years.

Clairington is seventeen years of age and is an active member of the Mt. Zion 4-H Club and has served as president, vice president and treasurer of his club. He received second prize in the Egg Grading Contest, first prize at the county fair and has taken part in five public demonstrations. His gross returns from his Poultry Project so far this year is $195.00.

Three projects were carried on by him very successfully this year. They were Victory Garden, Poultry and Swine Projects. His Victory Garden consisted of ½ acre land. He sold $80.00 worth of vegetables from his garden. With the money received from his garden, he purchased two hundred Rhode Island Red baby chicks and raised one hundred and ninety of them. He sold one hundred and seventy of his chickens when they weighed 2½ pounds and saved the other twenty for home use. He purchased two pigs with the money received from the sale of his chickens. He killed his hogs when they weighed 300 pounds and sold $40.00 worth of hams and shoulders and kept the other for home use. He used the money received to assist him in his 4-H Club work and in school.

After school Clarington worked at a packing plant and a large portion of the money he received was invested in War Bonds.

2. Cody Metcalf of Grady county is one of the four outstanding 4-H boys of the State. It is announced that he will also be awarded one of the four $25.00 prizes given by the "Bankers Health and Life Insurance Company," Macon, Georgia.

Cody Metcalf is seventeen years of age and an active member of the Washington High School 4-H Club in which he has served as Project Chairman of his club for two years. He participated in two community exhibits, one county exhibit and two other exhibits. He carried three outstanding projects this year. namely; corn, swine and beef cattle. Aside from his regular 4 H Club projects Metcalf, along with other 4-H boys, gathered four tons of scrap iron, and paper. He assisted in the 7th War Loan Drive by soliciting applications for war bonds and stamps. Metcalf stated that his 4-H Club work has not only helped in winning the war but has helped his community by showing neighbors and friends how the latest Extension methods can improve their farm work.

3. Charles Logan of Baldwin Co. is one of the four outstanding 4 H Club boys of the State. It is announced that he will be awarded one of the four $25.00 prizes given by the "Bankers Health and Life Insurance Company" of Macon. Georgia. This company has been encouraging Negro 4 H Club work in eooperating with the Georgia Agricultural Extension Service for a number of years.

Logan is fifteen years of age, an active member of the Walker's Chapel 4 H Club and has served as president of his club for two years. He carried three projects this year, namely, beef cattle, corn and garden. He has taken an active part in the community, county and state exhibits. The first prizes were won by him in the corn exhibits this year. The painting demonstrations were given by him. He has manifested a deal of interest in some of the better Extension methods, such as, terraeing farm lands, planting lespedeza and improving pastures. This boy lives on a 146 acre farm and he helps with a large portion of the work in addition to his regular 4-H Club projects. He has helped to build 3,125 feet of terrace. As a daily duty, he milks twice a day, feeds eleven hogs, feeds and waters 200 hens and also grades sixty dozen eggs each week for the market. He has bought war bonds and has encouraged other boys to buy bonds also.

4. John Edward Heard of Emanuel County is one of the four outstanding 4-H boys of the state. It is announced that he will also be awarded one of the four $25.00 prizes given by the "Bankers Health and Life Insurance Company", Macon, Georgia.

Heard is seventeen years of age, an active member of the Summit Consolidated School Club and has served as reporter, secretary and president of his club. During this year he carried corn, garden, beef cattle and poltry projects. He has taken an active part in community, county and state exhibits. Sensing the urgent need for more food to feed the boys of the armed forces and supply lend lease, Heard started his first 4 H Club project which has two arces of corn and produced eighty-six bushels. This corn was sold for $61.35. A portion of the money received was used to purchase a war bond. In 1942 he produced enough vegetables from his 1½ acre garden to feed his family of eight members. The value of his garden was estimated to be $120.75. In 1943 he realized that there was a great demand for meat, therefore, his project was a feeder calf. He purchased the calf weighing 538 pounds for $53.80. He sold this calf for $138.96. With the money received, he helped his father build a dam for a fish pond which was three acres. They stocked this pond with 400 fish. In 1944 he selected poultry for his project. He built a home brooder and placed 200 baby chicks in it. Out of the 200 baby chicks purchased, he raised 174 to broiler size. He sold 75 cockrels weighing an average of 200 lbs. the pullets were kept for layers. The project valued $186.00. For 1945 he selected the growing of sweet potatoes as his project. This project consisted of four acres of ground. Heard is expecting a return of 300 or more bushels per acre fom this project.

The Builder

An old man, going a lone highway,
Came at the evening, cold and gray,
To a chasm vast deep and wide.
The old man crossed in the twilight dim;
The sullen stream had no fear for him;
But he turned, when safe on the other side,
And built a bridge to span the tide.
"Old Man," said a fellow-pilgrim near,
"You are wasting your strength with your building here";

"Your journey will end with the ending day,
You never again will pass this way,
You've crossed the chasm deep and wide.
Why build you this bridge at eveningtide?"

The builder lifted his old gray head
"Good friend, in the path I have come," he said,
"There followeth after me today
A youth whose feet must pass this way.
This chasm, that has been as naught to me,
To that fair-haired youth may a pitfall be.
He, too, must eross in the twilight dim.
Good friend, I am building this bridge for him."

(Author unknown.

First Charlady: "She wanted me to 'ave a finger in the pie, but I smelt a rat an' nipped it in the bud."

Second Same: "Lor', Mrs. 'Arris, 'ow you do mix your semaphores."

"By the way, who is that long and lank girl standing over there.

"Hush. She used to be long and lank, but she's inherited $100,000. She's tall and stately now."—Atlanta (Ga.) Raiload Journal.

Mooreland . . . Where Town and Country Cooperate

EDITOR'S NOTE:

This is an inspiring story. It was out of the **Modern Farmer** by Mr. Cornelius King of FCA. Although it is longer than our usual features, it is included here because we think. **You can do these things too.**

The article should give you an idea or so on what you can do in your community. Pick the one that soulds best. Talk it over. Get going on something. There is no better time to start than now.

In Mooreland, Oklahoma, a town of about 900 population, and in the surrounding country, the people talk about their hospital instead of about their operations.

If you don't believe it, just talk to them for a short while and you will be convinced. It's part and parcel of the cooperative spirit, call it civic pride, if you wish.

The stores, garages, filling stations and offices of Mooreland stretch along one street, about 20 places of business on each side of the concrete main street. And the homes extend for several blocks to each side.

Here the business men recognize that their property is dependent upon the patronage and service which they can render the farmers and the farmers, in turn, appreciate they need the town. And here, also, farmers' cooperatives do business alongside private business, and there is no friction. As one farmer-member of a co-op expressed it, "We don't want to run the town nor do all the business, by a long shot.' And a business man says, "The co-ops help to build farmers' income, and that's good for the community. If the farmers are not prosperous, certainly we are not."

Drop in to one of these stores or the post office or the newspaper office and mention hospital and you won't get away for an hour. And it's the same out in the country. It seems that almost everybody has a membership in the Northwest Community Hospital Association, and instead of telling you about how they felt after they had their appendix or gall bladder removed, they tell you about how they were treated at the hospital and what a wonderful place it is. They get down to cases, too. One old man went into the hospital shortly after it was opened two years ago and he likes it so well that he refuses to leave!

Then there's the story of the boy who was shot through the stomach and liver and who wouldn't have lived if the hospital hadn't been nearby. And the boy who was about to choke to death and the hospital saved him.

On the street you meet an old youngster with several important parts of his anatomy missing who says he was about "mortifying to death when they opened me up." He's as good as new now.

And then you go into an office and instead of a long recital of how the appendix and gall bladder came out, you are shown the bills representing the costs of removing these appendages, down to the last cent. "And think what it would have cost anywhere else," they exclaim. They carry these receipted bills in their pocketbooks, and they are well thumbmarked from frequent use.

And out 20 miles from Mooreland you meet a farmer who talks "hospital." To him it means a comfortable bed, a pretty nurse, good food, and all the gadgets necessary to do an up-to-date job on the human anatomy. Guess work is eliminated as much as possible.

And this is also important: Doctors in this territory always have and still do charge the farmer one dollar a mile, besides a fee and the cost of the medicine to come out to the farm—and the doctor can't bring the hospital with its paraphernalia and the pretty nurse with him!

Well, that's what they think of their hospital now. Maybe they think so highly of it because they had to work so hard to get it and because it's theirs—not just any hospital. Also they remember the days when they didn't have one.

This community, at least the farmers, is a little different than the average. It has had to work for what it has gotten. It's just an average place as far as prosperity and income are concerned, but the farmers have been practicing cooperation for 30 years or more. The hospital, in a way, was a logical outgrowth. The farmers for years have done business with their own elevator, store, and creamery as well as with the privately owned businesses. Also the town by owning its waterworks and electric light plant has not only reduced the cost of electricity and water to a nominal sum, but has reduced the general tax levy to 45 mills. Water in summer costs only $1 for 6,000 gallons and in winter $1 for 3,000 gallons. It's virtually on the water wagon all the time!

People of the town and country worked on the idea of a community hospital for four years before it became a modern concrete and steel structure containing 70 rooms and all the modern equipment. Many people gave of their time unstintingly and without pay. At one time when the project stalled, many people donated their services in pouring concrete, painting and grading. At one time, there were as high as 115 people working on the project without pay.

The hospital, among the very finest general hospitals in the State, makes it possible for the people of the entire northwest community of Oklahoma to receive adequate medical, surgical, dental and hospital care at a cost within their means. It was completed at a cost of about $125,000 and paid for by the Federal Public Work Administration and the town of Mooreland. The town issued bonds up to $40,000 and individuals and families have donated funds to furnish individual rooms and install an elevator.

About 600 families have taken out $50 memberships in the hospital association which entitles them to special discounts on prices charged for rooms, X-ray and laboratory tests, dental and other services such as therapy treatments. For instance room rent runs from $4 to $6.50 per day, but members get it at half that price. Medical and surgical treatment are free by the association's doctors and there is a 50 per cent discount on meals and nursing services. Regular prices are charged for drugs and dressings and for operating room and anesthetic. Dental bills are reduced by one fourth.

The hospital is operated under the rules and regulations of the American Hospital Association. Anyone can receive treatment at the hospital and many people use the facilities of the institution who are not members of the association. It operates as a benevolent, non-profit corporation under the State law. Of the 799 patients treated in the year ended June 30, 1944, 355 were members and 394 were non-members. During the next year the cases handled were 916, of which 236 were members and 590 non-members. The growth in non-member patronage does not reflect a lack of interest on the part of members but rather it shows that many of the members have been treated for their ills and have not had to return during the past year. And that points up one of the principal reasons for being a member. The plan encourages members to receive treatment before they become seriously ill. And paying dues annually also takes away a good bit of the fear of heavy sickness expenses and the high cost of operations.

The annual dues, payable in advance, are set at $15 for one member; for 2, $24; 3, $30; 4 or more, 35. The multiple dues cover direct members of the family. Other reasonable arrangements are made for secondary dependents. At the beginning of the fiscal year, 98 per cent of the members had paid their dues in advance.

In keeping with the cooperative, non-profit character of the institution, all who work at the hospital are paid basic salaries and are given bonuses as the volume of business grows. The objective of the association is to increase the services rendered and reduce the amount of the anuual dues.

No small part of the success of the institution is due to the choice of doctors and the hospital manager, and the workers in the hospital. The spirit of the institution is that of the town and countryside—cooperation and excellent service. Plans are under way for a 70 foot addition to the hospital, and the directors agree that the institution which has been operating for two years has progressed beyond where they thought it would be in five years.

The directors of the association serve without pay and they have put in long hours making the association a credit to the community.

CREAMERY A SUCCESS FROM THE START

"The day it rained was when we started the Community-Creamery," said President F. E. Dail, and then he recalled the calendar date was November 17, 1934. Both stood out clearly in his mind. It had been an exceedingly dry year—dryest ever—and the drought ended on that day. And at the same time there ended the series of school house meetings at which the creamery project had been explained to the merchants and farmers. The merchants put up most of the money to get it under way. Two hundred dollars in those days looked like more than $1,000 today, and the 8 per cent dividends the stock was to pay was less than people were paying currently for borrowed money. But the merchants figured this creamery would be a good thing for the community. "The town can't thrive unless the farmers are prosperous," they said, and they were prepared to kiss their money goodbye if the creamery wasn't a success.

But they and the farmers didn't go into the venture with their eyes shut. Two years before, they sent a committee into Minnesota and Wisconsin to see how co-op creameries operate and what made them successful. They took a survey of the cream being sent out of the Mooreland district and found it was around 200,000 pounds annually.

It was only then that they authorized the sale of $8,000 of stock in $25 shares, no one to hold more than $200 worth. There are now 245 shareholders. The creamery was a success from the start. All of the stock has paid dividends or interest equal to the original investment, while some of the farmers who bought stock got their money back in patronage dividends within a few months. At times, however, the going was a little tough, but as one director expresses it, "We expected the old-line companies to buck, and they did a good job of it." Nevertheless, the creamery has paid the patrons from 3 to 5 cents a pound above Kansas City quotations in the form of dividends. Before the creamery existed, the going price around Mooreland was around 1 cent per pound below Kansas City—and no dividends. In September, this year, the price paid patrons was the Kansas City price of 46 cents, plus 5 cents per pound dividends, the same rate it has paid since July 1942.

The creamery has built up a net worth of about $26,000 and has made liberal chargeoffs for depreciation. About 800 of Woodward Country's 1,540 farmers are customers, and it serves much of northwestern Oklahoma from 11 cream gathering routes, averaging about 160 miles each. Not only has the creamery raised prices for its patrons, but it has been a big factor in raising prices to all farmers who have milk or cream to sell. The patrons last year received dividends of $22,000 which is in addition to the Kansas City quoted price. It is estimated that the creamery is worth around half a million dollars a year to the dairy industry of this area. Since organization it has paid dividends amounting to $128,155. And that, of course, is reflected in the business community. In addition, the town benefits from the $7,000 annual payroll and the $1,200 paid to the public utilities which the town owns. The board of directors is supposed to be composed of two business men and three farmers, but the town men turn out to be farmers, too. The creamery itself is largely responsible for the slogan which it uses, "Largest Butterfat Producing Community in the State."

ELEVATOR—SENTINEL OF PROSPERITY

At the edge of the town, near the Santa Fe tracks, stands the almost new monolith concrete elevator, like the giant silos, with a capacity of 90,000 bushels, equipped with the latest machinery for dumping grain from the trucks into the dump heads holding at least 2 freight carloads. From these heads the wheat is elevated to any one of the 15 huge bins. From these bins the grain can be run back into the heads and the grain mixed for raising grade or for controlling the moisture or for cleaning. Annually it handles from 300,000 to 400,000 bushels of grain.

Although this elevator is new and the last word in construction, requiring the minimum of labor in handling the grain, cooperative marketing of grain is not new to this community. It harks back to 1916. At that time buyers "were taking something like 12 cents a bushel off the farmers for handling." Then when the co-op was started, one director recalls that a buyer offered him 6 cents a bushel above the current local price, but he didn't get the wheat. This same director estimates that the elevator has meant 5 to 6 cents more per bushel to growers, ever since the co-op started nearly 30 years ago.

The grain is sold through the Union Equity of Enid. The current price is paid the farmer when he delivers and he receives a patronage dividend at the end of the year which has run from 2 to 7 cents per bushel, besides the equity which the member is building up in the buying it through the Oklahoma co-op and the Equity at Enid. The refund amounted to 2 cents last year or about $400.

The new elevator cost about $26.500 and was largely financed through a loan from the Wichita Bank for Cooperatives. The loan was paid off in 2 and one-half years.

TRADING COMPANY ADDS TO FARMER'S INCOME

The elevator operation is part of the Farmers' Co-op Trading Company which was started in 1915. It also owns the co-op store which handles all kinds of groceries, feed, seed, fertilizers and oils. Near the elevator is a large feed mixing mill which mixes feed in bulk for the patrons or sacks it and sells it through the store. Bulk mixing is done at a cost of 10 cents per 100 pounds. It does a business amounting to $8,000 to $10,000 a year. In addition it handles 500 to 600 tons of coal a year for the members, Cooperative Grain Dealers Association and saving the members 1 to $2 a ton.

The Farmers' Co-op Trading Co., has about doubled its volume of business since 1941, doing $113,000 of business with its 500 or more patrons in 1944. Its stock of groceries compares favorably with that of other stores and so does its brands of feed, seed, fertilizer and oils. About 90 per cent of the feed handled comes from the Consumers Cooperative at Enid, a branch of Consumers at Kansas City.

Virtually all business is on a cash basis and the average patron buys from $45 to $55 worth of groceries a month. On much of these purchases he saves around 10 per cent. Prices of commodities are cut to a point where there is not much left to pay in patronage dividends. One of the directors says of this way of operating: "It's most satisfactory all the way around, and it avoids a lot of bookkeeping." However, prices are enough above costs so that the company has built reserves of about $70,000 plus its holdings in Union Equity. It has a capital stock of $30,000, and 15 shares or $150 is the maximum which any one can own. On these shares it has paid interest regularly.

So, through their elevator, store creamery, and hospital, the people in and for 50 miles around Mooreland have demonstrated that they can improve their lot economically, socially, and physically, by working together.

E. B. REID,
Director Information and Extension Division Farm Credit Administration U. S. Department of Agriculture, Kansas City 8, Missouri

Wife: "Aren't these chimes beautiful? Such harmony. So enchanting."

Alex: "You'll have to talk louder. These d____ bells are making so much racket I can't hear you."
—Wilson (Kas.) World.

In prewar years the United States imported an average of 3,000 tons of dried figs annually.

National Temperance Movement Advocates Total Abstinence

Chicago — Flatly denying statements charging the National Temperance Movement with advocating federally-owned distributing agencies for alcoholic beverages, leaders of this organization stated today that it is unalterably opposed to all beverage use of alcohol and firmly in favor of total abstinence.

The denial came in answer to statements made by a Robert Barry in the November issue of TAVERN NEWS, in which he said that the Rev. W. Earl Hatalen, Birmingham, Alabama, and the Rev. Herbert H. Parish, Chicago, president and administrative director respectively of the National Temperance Movement, "are using their tireless energies to convince other prohibition organizations that national abstinence is not possible, but the nationalization (of the liquor industry) may be achieved."

"There is not the slightest color of truth to anybody's idea that the Natl. Temperance Movement approves of an organized and commercialized supply of and traffic in beverage alcohol on any basis or plan whatever," the Rev. Mr. Hotalen declared. Among the purposes of this organization, as set forth in its constitution, are "to voice and make effective the demand of the American people for moral regeneration of the American way of life; to find a Christian solution of the beverage alcohol problem. . . . to formulate and achieve local, state and national legislation for the abatement of alcohol-caused social evils, and for the extermination of the traffic in alcoholic beverages."

Whether or not Mr. Barry intennded either to confuse or mislead his constituents by mis-statement of facts, or to confuse and mislead the Drys, his statement is absolutely false, the Rev. Mr. Parish emphasized.

"To consent to or favor ANY method of sale and distribution of alcoholic beverages is consenting to sin, and that position is untenable for a Christian organization," he maintained. "The National Temperance Movement stands solidly opposed to privately-owned, municipally-owned, or nationally-owned distributing agencies for alcoholic beverages in any form."

WORLD FOOD OUTLOOK DARKER FOR 1945-46

An increasingly grave world food situation, brought on by lower production and diminished stocks, is forecast for 1945-46 in a survey made by the Department of Agriculture's Office of Foreign Agriculture Relations. The survey is based on official reports from all geographical areas.

Total world farm production for 1945-46, according to the survey, will be about three percent less than the prewar average in terms of calories. Per capita output will be about 10 percent less if allowance is made for the net increase in population during the war.

In a public statement on September 18, Secretary of Agriculture Clinton P. Anderson pointed out that there are only two methods at present for financing the use of U. S. food in liberated countries: (1) Those countries with financial resources may buy food from us, and (2) those unable to pay may receive aid from UNRRA.

Inauguration Exercises Of Dr. Ralph W. Riley As President

Invitations are being circulated through mail from the trustees and faculty of the American Theological Seminary here in Nashville for the inauguration exercises of the Rev. Ralph W. Riley, D. D., as president of the seminary. The program is to be delivered in the main auditorium of the Spruce Street Baptist Church on Eighth Avenue North Dr. Wm. Freeman, the registrar, has invited and is expecting a large attendance.

Georgia's Log Cabin Community Outstanding

Log Cabin Community, a Remarkable Contribution to Educational Theory and Practice in Better Living and Racial Understanding. Negroes Working Out Their Own Salvation in the Open Country.

Mark Twain once said, "Everybody complains about the weather, but I do not see anyone doing anything about it." Everywhere today, there are people North and South thinking, talking and writing about the Negro. They wonder what will happen when Negroes return from the war front and from Industrial centers where they now fight and work along with millions of other race groups. They talk about the best ways to bring happiness and contentment to Negroes who live on farms, but seldom do we find any definite forward looking steps being taken towards developing here in the South a progressive program that will meet the needs of the people. Negroes at Log Cabin Center are developing a program of education for themselves that commands respect and confidence of thinking people everywhere.

My father, the late Jim Williams, until his death the editor and publisher of the Herald Journal, was deeply interested in the problems confronting people here in the South. His desire was to have the more abundant life come to all men—white and black—here on the farms of the South. He wanted to see the two race groups in the South understand and appreciate the other at full value. After a close up study of the community at Log Cabin Center, he wrote ten years ago:

"Down in Hancock County there is a Negro rural community better organized perhaps than can be found elsewhere in the South today. Really we might cover more territory and say in the whole of the United States. The white people of the county take a keen personal interest and pride in the Center. Already this community leads in purebred beef and dairy cattle, hogs, and chickens. A garden and flowers are found in every home. Crops of wheat, oats, corn, etc., will demonstrate what is being done. The church, the school, the community store, the community house are some of the evidences of material progress in the community. Log Cabin Center is the outgrowth of the life-long efforts of the Hubert brothers to find some way in which farm life and farming may be made attractive to Negroes. They have really gone to the root of this great rural question. The writer endorses fully the work of the Hubert brothers and the Association for the Advancement of Negro Country Life in this wonderful undertaking."

Ten years in the life of a community is not long, but in this short period much has been accomplished.

THE SCHOOL

The school has been enlarged and its services to the community have been expanded and vitalized. A Home Economics building and canning plant have been built by the people themselves. Electric lights and running water have been installed in the school and in the homes of many of the farmers The school now has eight teachers with full time teachers of vocational agriculture and home economics. In a recent rally the people raised $1400 to improve and expand the program of the school.

THE CHURCH

The community church has just completed a drive in which $500 was raised to paint and otherwise improve the community church program. The minister, a university trained man, lives in the community and serves other nearby rural communities. There is a community parsonage. This minister heads the association of 30 rural churches in this area.

COMMUNITY STORE

The community cooperative store has been enlarged and improved. It now serves in a very fine way the people in an ever widening area. It is a center for the orderly marketing of farm products. It also provides for the immediate needs of the people for food supplies that they are not able to produce on their farms. Recently the store has been greatly enlarged. A large refrigerating plant has been installed, where home-raised meats, eggs, milk and butter and vegetables can be stored.

COMMUNITY LUNCH

An attractive community lunch room, built out of logs and native stone, is one of the sources of special interest. Here we find electric lights, running water, music and good, well planned meals served at most reasonable prices. These meals are largely from products of the farms of this community. This lunch room meets a real need. It provides a living example of how to prepare and serve well-balanced meals. It is the center of attraction for the teachers of Negro farm children and for people on the farms and the small towns, who look for an inviting place to go when the day's work ends.

FARM SHOP

The farm shop recently completed provides splendid opportunity for education in home industries. Here the people learn new ways of farm repair. They build cabinets, tables and swings, chairs for the home, and sharpen farm tools for a better day's work on the farm.

COMMUNITY HOUSE AND HEALTH CENTER

The beautiful community house, built out of native logs and stone and the health center, serve as a beacon light to people in any section of the South. People of both race groups come from far and near to learn how country people can find for themselves better and more healthful ways of living. They find out that people can enjoy social life by coming together in their own communities to play and sing and to discuss more progressive and wholesome ways of living. Book clubs, hunting and fishing, story telling, dancing are all a part of the wellrounded community life. This probably the most used community house in any community of the South.

A CENTER FOR NEGRO GIRL SCOUTS

On a forty acre tract of land a beautiful structure of logs and native stone has recently been built. This center will serve as a training center for the colored girls of all Geogia and the South East. It will be impossible to overemhasize the good and far-reaching effect of training, of future leaders of the colored race in such a splendid environment.

SUMMER SCHOOL FOR TEACHERS OF NEGRO FARM CHILDREN

National authorities in the field of education have declared that this program for training teachers of farm children in the community where the farmers and their families are at work is one of the most far-reaching, pioncering and forward looking steps in the realistic education of farm people. Here at Log Cabin Center the Georgia State College in cooperation with the Association for the Advancement of Negro Country Life has gathered together Negro teachers from counties from all of Middle Georgia for instruction, stimulation and encouragement. The program has been kept down to the earth. Teachers not only are brought in touch with the best methods of doing things, but they learn to do some of the things themselves that go a long way towards making life in the country satisfying. Teachers learn how to teach reading, writing, arithmetic. They also learn how to teach their people the necessary for and how to make for themselves country toilets, steps, fences, tables, baskets, rugs and other farm needs. They learn how to lead in stimulating better gardens more and finer dairy cows, hogs, and poultry. The teacher on returning home finds herself a great inspiration to all the people, because she has a working knowledge of how to help people toward "the more abundant life."

BEEF CATTLE SHOW AND SALE

One of the most far reaching practical and serviceable demonstrations found in the Log Cabin Community is the emphasis placed upon beef cattle. The work done here has been of inestimable influence on the farming practices of Negroes in all sections of Georgia and the South. Nearly fifteen years ago the first purebred beef bull, owned by Negroes in middle Georgia, was brought to this community from Tennessee. Slowly the Negro farmers began to realize the place of beef cattle in their farming operations. Soon beef cattle, white faced Herefords, began to appear along with more attention to pastures. This idea of beef cattle spread to counties in all sections of Georgia. Negro Club boy began to fatten out calves, and bring them to market in every

A Letter On Pioneering In Rural Rehabilitation By Tennessee Farmers

DEAR FARMER:

The small rural community with its church, school and family-sized farms is the foundation of American democracy. By tilling the soil and earning a substantial livelihood: by meeting their neighbors around the little country church and planning together to do the things which work together for the good of all:—These things, coupled with a genuine love of God, have brought the greatest happiness to Americans. Working together!

In recent years the coming of the automobile and other means of communication has taken the interest of the people away from the farm community centers. The little red schoolhouse has turned gray for lack of paint. The windows are broken out and when it rains, Johnnie and Susan have to change to another seat to get out of the drip from the ceiling—all huddling about the rusty stove for warmth.

In many instances the country church has been deserted. its doors left open to rain and snow—a ghostly reminder of a God given charge unkept. On Sunday people go carelessly by the church, in search of more interesting activities, forgetting that which has contributed most to the democratic way of life.

Why do these conditions exist?

The community spirit and common interest have been diverted. This lack of community unity and purpose has thrown rural people off guard, and we are unprotected from the schemes of organized business and political groups. Farmers have forgotten that, just as our forefathers banded together o defend themselves from Indians and wild animals, so de we rural folk today need to stand pat.—to stick together—for the things which we agree is for the good of all.

So the remedy is ORGANIZATION!

Not necessarily state or county set-ups,—But **Community** organizations of farmers who have absolute control of their own group.

The Farmers Union is such an organization, having its beginning in the community and composed of farmers and their families exclusively. The most important part of the National organization is the small community local, which has organized itself after the farmers have seen their needs as common needs. Fifteen paying members (heads of families) may apply to the national officials of Farmers Union for the charter, and three such locals in a county may form a county organization. Action must start with the individual farmer and work up. The farmer controls the local's work, and the farmer is the one who reaps the first benefits The county council is in turn represented in the state and national organization.

The Farmers Union is an independent organization started in a country school in Texas in 1902 and chartered in 1903. The present membership is 400,000. It has no connection with any other organization, but cooperates with any group interested in public welfare.

The Farmers Union is designed to serve a three-fold purpose The basic objective is **education**—for by our becoming aware of our problems and learning how to solve them, we lay the foundation for new opportunities and better living conditions.

The second goal of the Farmers Union is **legislative representation for the small farmer.** Each local has a legislative committee and the National Farmers Union maintains an office in Washington, D. C., to work for legislation which the members want. The Farmers Union, however, is non-partisan politically.

The third project stressed by the Union and usually the most interesting to the farmer, is **cooperative buying and selling.** One farmer alone has little purchasing and marketing power. He sells by the bushel and buys by the bag or the ton. Twenty farmers may sell by the thousands of bushels and buy by the carload. It is easily seen just how farmers may save double by selling and buying together. The state laws of Tennessee encourage farmer's cooperation. The national government recommends them as contributing to a sound economy.

Membership per year for the entire family is $2.50. The national office receives 50c for subscription to the **National Union Farmer,** the official paper of the Farmers Union, and $2.00 remains in the community and state.

The Farmers Union helps us help ourselves. Individually we are weak but by bringing farmers together in union gives us power—power to buy and sell as a group, power to build a better community. Together we can face the rural future with confidence and determination.

We will remain powerless until we get together, community by community, in an organization run by working farmers. In Franklin County we have found the National Famers Union to be such an organization.

The Farmers Union is coming to Tennessee! The farmers are demanding it! When enough farmers throughout the state take the initiative to form locals in their communities, a state organization will be formed. Meanwhile the national office and the Tennesssee organizing committee intend to see that every aid possible is given to these new groups. They may expect opposition and smear campaigns, but the farmers of Tennessee must use their own sound reasoning. At all times the Farmers Union is open for investigation. Any farmer interested in knowing more about it is welcome to write the Tenessee committee for more information.

Sincerely yours,

HOMER CRABTREE, Secretary
Tennessee Organizing Committee
National Farmers Union.

JOIN THE FARMERS UNION

----for the sake of your young people. Give them a chance to learn how to make farming the way of life they will want to follow. Give them a chance to participate in the Farmers Union Junior program of play, study, camps and folk schools.

----to make your community more neighborly. Meet together, discuss your problems together, sing and play together, act together—build community unity instead of suspicions that divide you.

----to cut high profits in farm machinery and other things you need on the farm and in the home—to lower costs of insurance, of small loan credits—to cooperatively own the business that you pay for

CO-OPS ARE NECESSARY

(U. S. DEPARTMENT OF AGRICULTURE)

"A co op is owned by its members and run by them. Each member has a stake in the co op and an equal voice in its affairs. The members set their own plans of operation, and settle their problems by free discussion.

"When there is an important question to decide the members talk it over and make a decision. There is no dictator telling them what to do. Co ops follow the American way of doing things—they belong to the people."

"More than 3,000,000 American Farmers are using their own cooperatives to buy things they need, and to sell the crops they raise. They are buying more than 2 billion dollars worth of business thru their co ops every year."

—From "Co-ops Are Democratic," F. S. A.

FARMERS UNION, A SERVICE ORGANIZATION

To make effective the policies worked out by the members, the National Farmers Union provides: a legislative representative in Washington, a national and state education department, a staff of cooperative experts, and THE NATIONAL UNION FARMER, a bi-monthly paper.

HOW YOU CAN START A LOCAL

1. Talk it over with your neighbors.

2. Get a few interested farmers to-

(Continued on page 11)

Georgia Log Cabin

(Continued from page 10)

section of Georgia. Then Alabama, Souh Carolina, Texas and most of the other southern states started work in beef cattle. Now it is a part of all live up to date extension and vocational programs.

Last year the Negro boys of Hancock county outstripped the boys from all other counties in the South. A boy from his county took the prize for showing the best calf in Georgia at the State Live Stock Show held at Augusta, Georgia. The boys from his county marketed 3300 worth of beef cattle at this one show. This Negro community is the first in the South to inaugurate an annual Beef Cattle Show and Sale in connection with its summer school for teachers of Negro farm children, now in its fourteenth annual session. Cattle exhibited and sold at these annual sales have been bred, raised and fattened out by Negroes Negroes from Hancock and several surrounding communities bring their cattle to the Log Cabin sale. Here we find people of both race groups anxious and willing to buy. It is an inspiring sight to see these colored people, out in front, selling to white people and black people their own pedigreed cattle.

RECREATIONAL AND PHYSICAL FITNESS

Much has been said about teaching people what to do and how to use their idle time. This community has gone a long way towards teaching people how to play in the open country. A beautiful concrete swimming pool provides opportunity for swimming. Every boy and girl in this community knows how to swim. A barbecue pit, built of concrete and stone. enables the people to have occasional barbecue dinners. There are the bird dogs and plenty of game. Hunting is a sport that all enjoy. Book clubs, including Bible Clubs offer full participation for every one. Farm demonstration meetings, canning clubs, base ball and tennis are participated in by old and young alike. The people have something to look forward to. This tends to make their lives full and happy.

RACIAL UNDERSTANDING

Robert Quillen says that, "The first step in solving the 'race problem' is to realize that it never can be solved in the sense of ending it." The people in this community realize that friction and misunderstanding between men and women will continue to rise. They have developed a program that tends to challenge the best efforts of black and white alike. They realize they will be accorded increasing recognition. They are continuing to challenge people. They know that friendships with people, black and white, become stronger more enduring when there is constant evidence of mutual interest and respect; when there is every day the conviction on the part of people that there is need for neighborliness and friendliness regardless to the color of the man's skin.

The lessons emphasized by this outstanding demonstration of how to live on the farms of the South should be carried to people everywhere. Funds made available for the expansion and development of kindred programs in all parts of the south would help to revolutionize farming practices and race thinking people are in full accord with Association for the Advancement of Negro Country Life and the unique experiment in good farming and good living being carried on at Log Cabin Center, under the Sponsorship of the Association for the Advancement of Negro Community life and the Georgia State College at Savannah. The influence of what has been done is already felt in many parts of the South. There should be a community center of this kind in every place where people live and work.

—Greensboro Herald-Journal

gether in your home or schoolhouse.

Talk over community and farm problems.

Tell what the Farmers Union can do to help.

3. When 15 heads of families are ready to start a local notify the Organizing Committee, and some one will be sent to help you.

NATIONAL FARMERS UNION
Homer Crabtree, Sec., Decherd, Tennessee

The Bible, The Christian Worker's Guide

"Thy word is a lamp unto my feet, and a light unto my path."—(Psa. 119 :105).

Under the escort of Chinese soldiers the writer has gone down the mountain paths of that country in the darkness of night. On the end of a short bamboo rod a paper lantern was held by an attendant at his feet so that the light shone upon the path immediately ahead. The illumination was dim, but it was sufficient to see a step or two before, and that was all that was needed. The constantly moving lantern made a small circle which covered the ground where the feet were to be successively placed. The words of our text were vividly brought to mind, and with it came the words of an old hymn:

"One step I see before me,
'Tis all I need to see,
The light of heaven more brightly shines
When earth's illusions flee;
And sweetly through the stillness comes
His loving 'Follow me!'"

Thus safely through the journey, which otherwise would have been really perilous, we traveled confidently to the destination appointed.

The very words of the text are wisely arranged by one who had himself thus walked through the gloom of earth's byways. The "lamp" is held close to the feet that the "light" may shine on the path. The light thrown on the feet would merely cause shadows from them that would confuse, and render the steps uncertain. But when the Word is carried close to the obedient believer—in his mouth and in his heart, that he may do it (Deut. 30:14)—the divine radiance, which the living Spirit who indwells the Word affords, beams out on the way, and he is enabled to go forward in quietness and confidence. To the child of God who has learned the faithfulness of his Guide, there is no "haste" (Isa. 28:16), no fear or panic when things seem closing in upon him. He knows that the Lord is never before His time, but also that He is never behind, and that enlargement and deliverance will be given without delay or failure. "God calls us often to wait, but never to worry," said one who knew by experience the ways of the All wise Father and Discipliner of His regenerated family.

If we would know the enlightening power of the Word of God, we must be lovers of it. There are multitudes of Christians who never fail in the daily reading of the Scriptures. But the exercise is a duty which cannot be neglected without doing violence to their conscience. They have known only to a very small degree the joy of the Psalmist in the divine revelation: "How sweet are thy words unto my taste! yea, sweeter than honey to my mouth!"

To the lover of God's Word there comes at times unveiling of truth from the sacred pages which lift the heart into raptures of praise unknown to the ordinary reader. Streams of light fall on the passage being meditated upon. The Spirit of truth Himself clarifies the mind and gives a new understanding of the fulness that is stored in the Scriptures. Things that have been obscure now become plain and even glow with a spiritual beauty that is new and blessed. The spirit is revived with a sense of the presence of the Lord, and the Bible becomes in a peculiar way the very voice of God speaking directly and personally to the soul. His will becomes so desirable that every impulse of the believer's will seek to obey with great delight what is revealed of the divine purpose.

It is to hearts thus impressed by the mind of God as revealed through His Word that He is able to give constant and sure guidance. They have become accustomed to know the mind of the Lord by their unceasing listening to His voice in the Word. When He speaks directly to the inner man, there is an intuitive discernment as to the source of the command or suggestion, and a conscious rejection of what is from any other source. Because the Word has become familiar to the inner man, it is in very truth what the Psalmist calls it in the words of our text: "a lamp unto (the) feet and a light unto (the) path."

Tolerance Is Not Enough

By Walter P. Reuther
(in "Labor Reports")

(L. R.) Detroit. How many Bilbos will break a democracy's back?"

Sometimes it seems that the American people are playing around with this question, seeing how close they can come to an answer. We pay lip-service to our national creed, summed up in the declaration that "all men are created equal"—but in our everyday relations with our fellow-citizens we are prey to the same old habits of mind and behavior, full of the same old prejudices and failures of understanding.

In short, we are drifting. We are sitting around, twiddling onr thumbs while the time-bomb of race hatred and group animosities ticks away the hours left for a solution. The newspapers (some of them at least) reflect the embarrassment of all men of good will over the antics of Rankin, Bilbo, Gerald L. K. Smith and the other crackpots of the lunatic fring. And we all applaud. But do we soberly confront the fact that Billbo and the other celebrated peddlers of primitivism have been spawned and nourished in an environment which each of us has helped to create by the petty prejudices we have not bothered to root out from our minds and hearts?

The Bilbos thrive amid ignorance, confusion and indifference. Every time we call a fellow-worker a Wop or a Kike or a Pollack we help the Bilbos and the forces of reaction. Organized workers are human, and they are part of the broader community. They share in vary degree all the blindnesses and shortcomings of that community. But they have had certain experiences denied to other members of the community which should enable them more easily to grasp the folly of group hatreds. The history of the struggle between labor and management should teach them the high value of solidarity. They have known the strength which comes from uniting for common goals and they have felt the effects of the employer's ability to divide and conquer, to exaggerate and exploit the differences among them.

I have spoken of racial tension and hostility toward minorities as the products of irrational emotions and impulses. But these emotions and impulses, in turn, have been bred and have grown strong in an economic environment of scarcity, in which group could easily be pitted against group in a sheer struggle for survival. The plight of Europe today is evidence that the world has not yet emerged from a state in which there simply is not enough to go around under the old methods of production and distribution.

But the scene is changing before our eyes. We are still trying to talk ourselves into believing it—but whether we believe it or not the Atomic Age is here to stay, and this new era poses, in an intensified and final form, an old problem which we have been dodging. We have our backs to the wall now, and we must find an answer to our dilemma—or be written off in history's books as another casualty in the eternal process of change and adjustment, the change which downed the Dinosaur, the ancient Romans and the bicycle built for two.

That dilemma can be briefly stated. We must learn how to organize our economic life, in America and throughout the world, in such a manner that the potential abundance of fields and factories can be made available to the common man; so that the common man can enjoy both freedom and security, without having to face the recurring threat of depression and unemployment. We must learn now to live with plenty and with each other—or we must perish.

This is a problem of achieving a higher national and world output and of distributing it equitably, not a problem of carving up the same old, inadequate output to the satisfaction of some particular sector of the economy. We cannot solve this problem by finding employment for veterans at the expense of organized labor or by finding jobs for white men at the expense of Negroes, or by firing women or Jews or foreigners.

Nor can we solve this problem by building underground cities. Whether we live above or below the ground, we must find a progressive and a just solution of this problem, a solution which enables us to achieve an economy of abundance and economic democracy within the framework of political democracy.

Machinery will help. The UAW has its own Fair Practices Committee and we are for a permant FEPC and every other measure designed to combat discrimination and persecution. But such machinery is not enough. The old hatreds will remain as long as the old economy of scarcity remains, as long as there is not enough to go around.

Nor is tolerance enough. We may congratulate ourselves upon our broadmindedness. We may even remember, some of us, that it was a Jew, Emma Lazarus, who wrote the inscription on the Statue of Liberty calling upon the "huddled masses" of the Old World to seek the justice and opportunity of the New. But we must go beyond tolerance to positive action on all fronts for the purpose of attaining an economy of full production, full employment and equitable distribution.

By all means let us criticize the Bilbos. But let us look inward too. Let us awaken to the link between group hostility and the discredited old economy of scarcity and monopoly which in too many instances has been neither free enough nor enterprising enough. And let us remember that the sands are running out, and that history doesn't wait forever.

International Memorial Planned for Booker T. Washington's Birthplace

TUSKEGEE INSTITUTE, Ala.—S. J. Phillips, of Tuskegee Institute, Alabama, who, on October 6, purchased the birthplace of Booker T. Washington, states that the 214 acres which constitute the property will be used to develop an INTERNATIONAL MEMORIAL to this great leader who made such a substantial contribution to our civilization.

Location of Birthplace:

The site of this property is located in Franklin County, Virginia, 16 miles from Rocky Mount, Virginia, and 25 miles south of the City of Roanoke, Virginia. State Highway 122 passes through the property. Several of the county's major oil companies have agreed to indicate the birthplace of Booker T. Washington on their road maps in the future.

International in Scope:

A portion of the property will be designated as a National Section. Plots in this area will be laid off for each state. State governments, organizations, and individuals may place on this plot any appropriate tribute to Booker T. Washington that they desire. A portion similar to the National Section will be placed at the disposal of foreign countries to be used by them on the basis of their appreciation for the part that Booker T. Washington played in the development of industrial education.

Birth Cabin Be Restored:

The land where Booker T. Washington's people worked and lived, and where, perhaps, he himself had borne within him the ideals of glorifying and dignifying labor which raised him from a humble slave cabin to one of the world's outstanding citizens, should be very dear to the hearts of his own people as well as to the rest of mankind that profited by his idea. On every plantation site there was, in the early days of our country "the big house" for the owner and cabins which were used as slave quarters. The owner's home is still standing. It is more than 100 years old. The base of the chimney is the only thing that remains of the cabin in which Booker T. Washington was born. This cabin will be restored according to description given by a playmate of Booker T. Washington, who still lives in the community.

"Living-Breathing" Memorial:

A planned land use program is being developed on this place as a "Living-Breathing Memorial." There will be planted shrubs, pines, and hardwood seedlings. As these reach the proper stages, they will be labelled and sent over the country as "Booker T. Washington Memorial Plants," to be placed in yards of homes, churches, schools, and park and playgrounds, serving as living "tributes" to his memory.

Demonstration Farm to be Established:

Since Booker T. Washington believed so firmly in the value of scientific agriculture and advocated strongly well-kept farms, a "Model Demonstration Farm," consisting of livestock and farm crops will be established.

Several organizations have expressed desires to participate in the development of this memorial. Their cooperation is welcomed. A group of Virginia citizens stated that they were desirous of establishing an industrial school on a portion of the property. There is ample room for this school if the group desires to carry out the project. The many groups, organizations, and projects that Booker T. Washington established are being asked to cooperate in the development of this memorial. Other groups and individuals who believe in the things for which Booker T. Washington stood will be asked to assist.

Will Be Non-Profit:

Mr. Phillips states that this memorial will be operated on a non-profit basis, and will seek to serve as an inspiration to "the man farthest down," to whom Booker T. Washington dedicated his life.

Shrines to be Studied:

Shrines throughout the country will be studied in connection with the development of this project.

WAKE COUNTY FARMERS FORM NEW COOPERATIVES

Negro farmers in Wake County, North Carolina are going all out for cooperatives in an effort to put them on an even keel to complete in the field of their gainful occupation, farming. Recently, three additional farm machinery co-ops have been organized and farmers are soon expecting the arrival of additional tractors, tillers, discs and hay bailers. The communities involved are Apex, Sandy Fork and Springfield.

While any one small farmer finds it impractical and uneconomical to purchase a tractor outfit for his small farm, ten or more of them make the purchase cooperatively and all of them benefit from the services. According to W. C. Davenport, Negro Extension Agent of the State College Extension Service, these farmers are being encouraged to work together, in these ways and many others through small cooperatives.

Avoid loss of juice in preparing meat, poultry and fish. Never soak such food in water.

WOMAN'S PAGE

MEAT ROLLS WITH CREAMED VEGETABLES

¾ pound of ground beef
1½ tablespoons chopped onion
1 tablespoon chopped green pepper
1 tablespoon butter or meat drippings
3 teaspoons salt
2½ cups medium white sauce
n1 recipe biscuit dough
3½ cups cooked vegetables

Melt butter or meat drippings in skillet, add meat, onion and green pepper; saute until meat is browned. Add 1 teaspoon salt, stir well and cool. Combine ½ cup white sauce with meat mixture. Roll out biscuit dough on a flour board, to a rectanguular shape about 1_3 inch thick. Spread cooled meat mixture over the dough and roll up like a jelly roll. Cut roll in 1_inch slices; bake on a baking sheet in hot oven (425 degrees F.) about 18 minutes, or until golden brown. Add cooked vegetables to 2 eups of white sauce, and serve hot over the baked meat rolls, Serves six.

PINEAPPLE MILK PUNCH

3 cups cold milk
2 cups cold pineapple juice
¾ cup cream
1½ teaspoons lemon juice
Dash of salt
12 drops peppermint extract
Ice cream

Combine all ingredients except ice cream and shake vigorously in jar or beat with rotary beater until smooth. Pour into tall glasses and add a scoop of ice cream to each glass. Serve with drinking straws. Serves six to eight.

PUMPKIN CHIFFON PIE

2 teaspoons unflavored gelatin
¼ cup cold water
3 eggs, separated
1 cup sugar
1¼ cups mashed cooked pumpkin
½ teaspoon salt
½ teaspoon cinnamon
¼ teaspoon nutmeg
½ teaspoon ginger
½ cup milk
1 gingersnap pie shell
Whipped cream topping

Soften gelatin in water 5 minutes. Beat egg yolks and add ½ eup sugar, pumpkin, salt, spices, and milk. Cook over low heat, stirring constantly until mixture begins to thicken. Add gelatin to hot pumpkin and stir until dissolved. Cool. When mixture begins to thicken beat egg whites until almost stiff and beat in remaining sugar, 1 tablespoon at a time Fold into pumpkin mixture, pour into pie shell and chill until firm. Cover with whipped cream topping.

HONEY ICEBOX COOKIES

2½ cups sifted flour
2 teaspoons double_acting baking powder
½ teaspoon salt
½ teaspoon cinnamon
½ cup chopped nut meats
1 egg, well beaten
½ cup sugar
¼ teaspoon almond extract
½ cup honey
¾ cup melted shortening

Sift flour once, measure, add baking powder, salt, and cinnamon and sift again. Add nuts Combine egg, sugar flavoring, honey, and shortening add to flour_nut mixture, mixing well Shape in rolls 1½ inches in dianieter, and roll each in waxed paper. Chill over night, or until firm enough to slice. Cut in ⅛ inch slice; bake on ungreased baking sheet in hot oven (400 degrees Fahrenheit) for ten minutes. Makes about 4 dozen cookies.

Try sprinkling a bit of nutmeg on buttered cauliflower.

APPLE MUFFINS

2 cups sifted flour
3 teaspoons baking power
½ teaspoon salt
¼ teaspoon cinnamon
2 tablespoons sugar
1 egg
1 cup milk
¼ cup melted shortening
1 cup finely chopped apples

Sift together flour, baking powder, salt, cinnamon and sugar. Beat egg and add milk, shortening and apples. Add egg mixture to flour mixture, stirring only until flour is moistened. Fill greased muffin pans ½ full. Bake in hot oven (425 degrees F.) about 20 minutes. Yield: 12 2_inch muffins.

PRESSED VEAL

4 pounds veal shank, meat and knucklebone
½ cup diced carrots
¼ cup chopped onion
¼ cup chopped celery
3 hard_cooked eggs
Salt and pepper

Cover meat and bone with water Add chopped vegetables; simmer until meat is tender. Drain, reserving broth. Let broth simmer until redueed to 1 cup, then strain, cool and skim. Dice or grind meat and add to broth. Season with salt and pepper. Decorate mold with slices of hard_cooked eggs, pack in veal mixture and chill.

FRENCH DRESSING

Pour 1_3 eup vinegar in bottle. Add 2_3 cup olive oil or salad oil, ½ teaspoon salt, ⅛teaspoon white pepper and 1 small piece of garlie. Shake well until bended.

Place stoppered bottle of French dressing in covered paper container. This prevents dressing becoming too cold to pour when stored in your refrigerator.

CREAMY MACARONI AND CHEESE

Cook a nine_ounce package of elbow macaroni in two quarts of boiling salted water until macaroni is tender. Drain. Melt 2 tablespoons butter or margarue; blend in ¼ cup flour with 1 teaspoon salt, ½ teaspoon dry mustard, ⅛ teaspoon pepper. Add 2 eups milk, 2 thin slices onion. Cook stirring 10 minutes or until thickened. Blend in 1 cup grated eheese. Add macaroni, simmer 10 minutes. Garnish. Serves 4.

APRICOT CHEESE SALAD

1 package lemon or orange gelatin.
1 2_3 cups boiling water or fruit juice.
1 tablespoon vinegar or lemon juice.
¼ teaspoon grated lemon rind
½ cup cooked apricots (canned or cooked dried)
2_3 cup cottage cheese
¼ teaspoon salt.

Dissolve gelatin in water. Add vinegar and rind. Cool and let thicken slightly. Add remaining ingredients, and pour into shallow pan, rinsed out of water to prevent sticking. Chill until firm. Cut in squares and serve on crisp salad greens. Top with mayonnaise or boiled salad dressing.

This salad can be made a day or so in advance and stored in refrigerator. It contains protein, vitamins A and C and minerals.

LIVER AND SAUSAGE CASSEROLE

1 pound beef liver, ground
1 pound bulk pork sausage
¼ pound ground beef
1 large onion, finely minced
2 tablespoons lard
2 eggs, separated
2 soda crackers, rolled fine
2 tablespoons salt
⅛ teaspoon pepper
1½ tablespoons minced parsley
½ cup chopped celery
½ cup catsup
1 teaspoon Worcestershire sauce

Saute the onion in hot lard until lightly browned. Add the liver, sausage and ground beef, and cook slowly, turning over and over until brown. Cool, add egg yolks, cracker crumbs, and seasonings. Pour into a greased casserole, cover and bake for 45 miutes at 350 degrees F. Uncover, increase heat to 450 degrees and brown. Serves 6.

GRAPE CONSERVE

4 cups prepared fruit
Grated lemon rind
¼ cup lemon juice
5 cups sugar
2 cups light corn syrup
½ pound seeded raisins
1 cup nut meats, finely chopped
½ bottle fruit pectin

To prepare fruit, steam and crush well about 3 pounds of fully ripe grapes. Add ¼ cup water, bring to a boil and simmer, covered, 30 minutes. Remove seeds and skins by sieving. If desired, chop or grind skins and add to pulp. Grate rind and squeeze juice from 2 medium lemons.

Measure sugar, corn syrup, and prepared fruit into large kettle filling up last cup with water if necessary. Add lemon rind and juice, raisins, and nuts; mix well. Bring to a full rolling boil over hottest fire. Stir eonstantly before and while boiling. Boil hard 1 minute. Remove from the fire and and stir in fruit pectin, then stir and skim by turns for just 5 minutes to cool slightly and prevent floating fruit. Pour quickly. Paraffin hot conserve..

Makes about 13 six_ounce glasses.

CANNED JUICES INCREASE

Production of canned vitamin C juices has multiplied during the war years, as shown by figures furnished by the Can Manufacturing Institute. The prewar output of canned orange juice totaled about 3,000,000 cases a year. Last year's pack for Florida alone was almost 14,000,000 cases. Grapefruit juice has increased from 12,000,000 cases to more than 21,000,000 eases. Blended grapefruit and orange juice has climbed from 1,500,000 cases to approximately 8,000,000.

SWEET POTATOES IN ORANGE CASES

4 large oranges
4 medium sized sweet potatoes cooked
1 tablespoon orange juice
1_3 cup thin cream
1 tablespoon margarine
1 tablespoon grated orange rind
1 tablespoon sugar
¼ teaspoon salt
2 tablespoons ground nut meats

Cut the tops off the oranges and remove the pulp with a spoon, being careful not to break through the rind of the oranges. Warm cream and add the margarine, salt, grated orange rind, one tablespoon of orange juice and sugar. Stir this into the well mashed sweet potatoes and whip until light and fluffy. Fill the oranges with the potato mixture, sprinkle the tops with grated nut meats and bake until light brown on top.

USE LOW HEAT FOR HASHBROWNING

An impatient cook usually has poor luck with hashbrown potatoes. The crisp, brown crust which makes this potato dish so appetizing requires low heat and no stirring. A hasty cook is likely to use too high heat which scorches the potatoes before a good erust forms, or to stir the potatoes as they cook so that they have no chance to brown well.

Here is a simple recipe for success: Melt a little fat in the frying pan. Add chopped cooked potatoes. Season with salt and pepper. Moisten with a little water—about ¼ cup to 4 cups of potatoes. Then cook over low heat until brown and crusty on the bottom. Do not stir the potaoes. Serve folded in haf like an omelet.

The low heat and no stirring holds good also for corned beef hash and for other hashes on which a brown crust is desired.

LIME CAKE FILLING

In a saucepan combine 2 eggs yolks with 1 can of sweetened condensed milk. Place over low heat and cook until thickened, stirring constantly. Add ½ cup lime juice and 2 teaspoons grated lime rind. Mix well. Beat egg whites until stiff, add 1 tablespoon sugar, and beat well. Fold egg whites into lime juice mixture and chill thoroughly. Spread lime mixture between layers and over top of vanilla layer cake. This filling can be used on sponge, angel food, or butter cake. Covers 2 eight_in. layers

STUFFED ACORN SQUASH

2 acorn squash
1 tablespoon butter or margarine
Salt and pepper
1 lb sausage meat

Cut squash in half and remove seeds. Rub the insides with butter or margarine and sprinkle with salt and pepper. Place in 375_degree oven and bake for 45 minutes or until tender. Meanwhile shape sausage meat into eight little cakes and pan_broil in a hot frying pan until well browned on both sides. Remove from pan and drain on unglazed paper. Fiftten minutes before squash is done, place two sausage cakes in each half and continue baking.

MOLASSES FRUIT BARS

1 cup brown sugar
½ cup sorghum molasses
1 cup melted fat
2 eggs well beaten
1 teaspoon vanilla
1 teaspoon soda
¼ cup hot water
¾ teaspoon ginger
1 teaspoon salt
About 4 cups flour
¾ teaspoon ginger
About 4 cups flour

Mix the sugar, molasses, melted fat, and well_beaten eggs. Mix the soda with the hot water and stir quickly into the molasses. Add vanilla, then the ginger and salt sifted with part of the flour. Use sufficient flour to make a soft dough. Chill for several hours and roll out. Cut in long strips about six inches wide. Spread a fruit paste on half the dough the long way, and fold the other half over Pinch the edges together. Bake in long strips in moderate oven (350 degrees) and cut in bars as soon as the cookies are taken from the oven.

Fruit Filling

Cook one cup of raisins or prunes in a small amount of water. Cut fruit in small pieces, add ¼ cup of the juice, three tablespoons of syrup and two tablespoons of flour. Cook until the filling is thick enough to spread.

MEAT COOKERY AND B VITAMINS

Though meat is important in the diet for its protein and fat it also contributes imporant quantities of three B_vitamins—thiamine, riboflavin and niacin. For this reason nutrition workers at a number of state experiment stations have fun investigating the effect of cooking on these vitamins. Their tentative findings indicate that of the various methods of cooking meat broiling conserves these vitamins best, and frying next best, with roasting a close third or perhaps on a par with frying. Braising rates fourth place, and stewing or boiling last. The amount of vitamins in the drippings from meat varies from almost none to as much as 20 per eent of that originally present in the raw meat.

Have eggs at room temperature before beating them.

The best way to clean silver is with a sponge which is dipped into silver polish and rubbed quickly over the stained silverware to remove tarnish in a jiffy.

RE_COVER OLD FRAMES

Odd bits of salvaged frabric, preferably some high_twist woven cotten in stripes, checks, or floral patterns, can be used successfully to recover old wire lampshade frames. Dramatic details, easily achieved on the sewing machine, may then be added to tie in with the other decorations of the room.

Best results in lampshade making are obtained by using fabric pieces on the bias, as it helps to achieve skin_tight fit, without a wrinkle.

CHRISTMAS YULE CAKE

Studded with fruit and lavish in flavor is this royal member of the holiday bread family. English Yule Cake leaves nothing to be desired in a festive bread. It is plump with the goodness of golden brown raisins and bits of candied fruit These luscious fruits mingle with enriched flour which has been made invitingly fragrant with a touch of spicy nutmeg. This flavorful spice carries an interesting history which makes its use in food especially romantic at Christmas. It is said to have been a gypsy love charm by the Rommany girl who sought to guarantee her lover's fidelity. Christmas list. They know that in_Christmas Yule cakes make excellent gifts for special folks on the to each tempting loaf is stirred an abundance of true friendship as well as a world of good flavor.

Serve Christmas Yule Cake as a spec ial occasion breakfast bread either plain or toasted. This fruity bread can be cut into wafer thin slices to make excellent tea sandwiches. Bake the bread a day or two before serving. Its candied fruit and rich cake_like foundation keep it delightfully moist. Spread the fruity slices with softened margarine or butter, velvety cream cheese, or choice homemade jams or jellies.

ENGLISH YULE CAKE

2 packages yeast, compressed or dry grandular
¼ cup lukewarm water
1 cup milk
½ cup shortening
½ cup corn sirup
2 teaspoons salt
½ teaspoon nutmeg
1 cup raisins or currants
4eggs, beaten
½ cup mixed chopped candied fruit
4 cups sifted, enriched flour

Soften yeast in lukewarm water Scald milk and add shortening, sugar, eorn sirup, salt, and nutmeg. Cool to lukewarm. Add 2 cups flour. Mix thoroughly. Beat 5 minutes. Put in greased bowl, cover and let rise in warm place (80 degrees to 85 F.) until doubled in bulk (about 1½ hours.) Stir down. Add raisins or currants and candied fruit. Mix well. Pour into 2 greased loaf pans, 4½ x 8½ inches. Let rise until double in bulk (about 1 hour). Bake in moderate oven (350 degrees F.) about 45 minutes.

Yield 2 loaves, 4½x8½ inches

GOLD PREFERRED

Gold preferred is the eurrent trend in necklaces—you can buy them for a few dollars or hundreds. Open_link chains are liked, and when the costume is all_black, five or six necklaces of different design but the same metal, are worn. you happen to be the possessor of some fine antique necklaces of gold, now is the time to wear them.

PACKING POINTER

When you pack keep some tissue paper on hand. Put little wads inside sleeves, under pleats and puff up all the folds and creases with it. Finaly, don't crowd your bag until it has to be sat on to close if you want to wear your things when you reach your destination.

THE MODERN FARMER

VOL. XVIII. NASHVILLE, TENN., JANUARY 15, 1946 No. 12.

The Road Up

No Back To The Farm Movement

By

GILES A. HUBERT

It is during times like these that the swivel chair boys in northern cities and on big city newspapers begin reminding the Negro that the farm is the best place for him. This has occurred during such periods before and it is beginning to happen again.

The argument is that Negroes fare badly in the overcrowded and "walled in" slums of the big cities where they fall prey to the "attendant social evils, such as delinquency, crime, malnutrition and disease." These same "observers" in other days would be telling the bedraggled Negro farmers to come to the city where they can get jobs, better educational facilities, have the right to vote, join labor unions and generally to make an advance toward full citizenship in this nation.

Now, I have been vitally interested in the problems of the southern farmer, and particularly the Negro southern farmer, ever since my maturity. I have worked with them and lived with them tryying as best I could to understand them and their problems. No one has greater belief in the necessity of Negroes getting a firm foothold in the agricultural industry in this country.

I do know these things: (1) That the natural rate of growth of the South's rural population is greater than that of any other major segment of the nation's population; (2) that the land resources, in terms of natural soil productivity, have been decreasing instead of increasing; (3) that any reorganization of southern agriculture to maintain soil resources and increase efficiency would also mean larger farms per family and thus fewer farm families; (4) that this cannot occur unless there is a constant drain of population out of southern agriculture into other occupations or to other regions. Otherwise the South can look forward not only to a continuance of its rural poverty, but an even lower level of living. We must remember that you can and do have "delinquency, crime, malnutrition and disease" in rural slums as well as in those of the cities.

The other agricultural areas of the country, with few exceptions, are fully manual during normal times and must also send surplus populations out of agriculture if they expect to maintain and improve existing living standards in those areas. Immigration to newly opened agricultural areas in the Northwest would require considerable amounts of capital per family and considerable training in the "know-how" of utilizing this capital in an entirely new kind of agriculture under very unfamiliar conditions. This, I am afraid, would take a generation.

Remember, that these former cot-

Extension Service Honors Tom Campbell

Over Half South's Farm Workers Colored; 18 Per cent Wage Difference

WASHINGTON, D. C., January 7, 1946.—Colored farm workers played an increasingly important part in the nation's agricultural production program in 1945, a U. S. Department of Agriculture survey shows.

The survey reveals that during last March when USDA's Bureau of Agricultural Economics made the study, colored workers made up 53 per cent of the South's hired farm labor force and 30 per cent of all workers employed on farms throughout the country. In 1940 nonwhites composed only 25 per cent of the U. S. hired farm workers. It is pointed out that colored women made up 19 per cent of the 460,000 nonwhite farm workers employed in the South last March.

However, colored farm workers in the South received lower wages than whites. The March survey shows that white male workers in the South were paid 18 per cent more per day on an average than colored, but both white and colored farm workers in the South were receiving significantly lower wages than farm workers in other sections. The lower rates were reflected in lower weekly earnings from farm work.

For example, while the average cash weekly wages in the West were $27.20, in the Northcast, $19.40, and in the North Central region, $16.30, in the South the weekly wage was only $11.20.

Of the two most important rates paid in the South—per day and per hour—the differential in average rates paid white and colored workers was reported sharpest for those employed by the day. The study shows that whites received an average of $2.60 per day, while colored received only $2.20; and female workers, mostly colored, received only $1.80 per day.

On the hourly basis, however, whites averaged 39 cents per hour and colored, 38 cents per hour. Women averaged 30 cents per hour.

A greater proportion of the hired farm workers in the South were employed at short-time seasonal jobs than workers in the North. Only 48 per cent of the hired farm workers in the South were reported regularly employed on the same farm

Negro Community Leads in Soil Conservation

WASHINGTON, D. C.—The leadership in soil conservation which Log Cabin, an all-Negro community in Georgia which has produced three Negro college presidents, has taken to help colored farmers everywhere produce betters crops is described in the November issue of "Soil Conservation," a U. S. Department of Agriculture publication.

This little community is now planning to extend its program of stimulating soil and water conservation throughout the Southland, according to the author of the article, T. S. Buie, regional conservator of the Southeastern Region of the Soil Conservation Service.

Log Cabin community is situated in the Piedmont Soil Conservation District. Recently the district sponsored a contest to determine which farmer in the community had done the most outstanding piece of conservation work. Prizes totaling $200 were awarded by the Association for the Advancement of Negro Country Life, headed by Benjamin F. Hubert, president of Georgia State college and son of one of the community founders.

Winners of the prizes were Ulysses Heath, C. O. Brown, Isaiah Warren, and Melvin Beasley. The awards were presented at the annual soil conservation jamboree in the Log Cabin community. In presenting the awards, President Hubert said, "Land is the basis and source of all wealth. We must learn to love the land."

The article points out that the community was founded by Zack, David, and Floyd Hubert shortly after the Civil War. Within three years they bought and cleared 165 acres. Today Negro farmers in the area own 27,000 acres.

Like much of the Southeast, the Log Cabin community has been hard hit by erosion which has caused a decline in crop yields. However, with the assistance of the Piedmont Soil Conservation District during the last few years, the colored farmers of the community have begun to control erosion and build up their soil. Already 14 farmers in the small community are cooperating with the district to the extent of placing all of their 3,356

(Continued On page 2 Col. 1)

Tenant Farmers Union Asks $5.00 Wage

The 12th annual convention of the Southern Tenant Farmers Union meeting in St. Louis, Mo., December 11, 12 and 13th, adopted a program calling for an annual wage of not less than $625 per year, or $5 per day for all types of farm labor. The convention also voted to change the name of the organization to **National Farm Labor Union.**

Among the high lights of the convention which was attended by 300 delegates, was a resolution which was telegraphed to President Truman urging that legislation be enacted which will provide for the seizure and distribution of large plantations in the same manner that General MacArthur has ordered in Japan to abolish farm tenancy and absentee ownership of land. General MacArthur has ordered the Japanese government to break up large estates and to resell the land on long terms at low interest rates to Japanese tenant farmers by March 15th.

The convention voted to establish a farm labor lobby in Washington and to raise funds to work for a five point legislative program. The legislation the farm labor lobby will work for includes: measures to resettle farm families displaced by the mechanical cotton picker on small farms; the extension of old age pensions to all farm people over 60 years of age; health, education, and rural housing programs; the extension of wage and hour, and national labor relations protection to farm labor. Cooperation with other agencies in securing the adoption of a Fair Employment Practices Act, repeal of the poll tax, and anti-lynching legislation was pledged.

Speakers addressing the convention included: E. P. Theiss, Washington, American Federation of Labor; August Scholle, Detroit, Congress of Industrial Organizations; and Mrs. Mary McLeod Bethune, President, National Council of Negro Women.

The officers elected for the year 1946 are as follows: H. L. Mitchell, Memphis, President; F. R. Betton, St. Louis, Vice President; Dorothy Dowe, Memphis, Secretary. Members of the National Executive Council are: A. E. Cox, Cruger, Miss.; J. F. Hynds, Spruce Pine, Ala.; J. E. Clayton, Chicago, Ill.; W. A. Johnson, Wardell, Mo.; George Stith, Howell, Ark., John Gammill, Clearview, Okla.; Carrie Dilworth, Gould, Ark.; Mae Pearl Kelly, Memphis.

Bust Presented To Tuskegee

Long Service Praised

TUSKEGEE INSTITUTE, Ala., Jan. 12, 1946.—National and State Agricultural Extension officials from Washington and Auburn joined with Negro Extension agents of the state and Tuskegee Institute in honoring T. M. Campbell whom H. H. Williamson, Washington's Assistant Director of Extension characterized as "dean of 10,000 county extension agents in 48 states."

Yesterday's program marking Mr. Campbell's forty years with Extension Service included formal exercises in the Institute Chapel in the early evening at which time a bust of Mr. Campbell was unveiled and presented to Tuskegee Institute to be placed in the Extension Building on the Institute campus. This was followed by a banquet in Tompkins Dining Hall.

In the opening chapel program A. A. Hicks, President of the Alabama Negro County Agents' Association

Veterans Asked To Form "Global" Unit Here February 11

The Veterans of World War II studying at the American Baptist Theological Seminary, are calling a meeting of all veterans interested in establishing a Global World War Veteran's Chapter in the City of Nashville. The persons interested are requested to meet in Griggs Hall of the American Baptist Theological Seminary, Monday evening at 5:00 o'clock, Feb. 11. The National Commanding Officer of the Global World War Veterans and other interesting speakers will be present. This move is an effort upon the part of the Veterans at the Seminary to organize a Global War Veterans Chapter to aid students and other veterans in securing proper information and assistance in connection with the advantage of education and home building.

Anderson Sees Revolution In Southern Agriculture

WASHINGTON, D. C., January 14, 1946.—Declaring that a revolution in the Southern farm economy is underway, Secretary of Agriculture Clinton P. Anderson told farmers in an address at North Carolina State College last week that a well-balanced, diversified agricultural program is the pattern for the future in the South.

The Secretary praised the white and colored farmers of North Carolina for the leadership which they have taken in the farm revolution of the South. Colored farmers of that State number 57,000, making up 20 per cent of all farmers in the State. They farm 2,728,000 acres, or 15 per cent of the State's farm land.

Reviewing the progress which the North Carolina farmers have made in diversification, Secretary Anderson said, "Just think back to the North Carolina of 20 years ago. Then your dominant crop was cotton. For 60 years cotton acreage had gone up—up and up until in 1926 North Carolina harvested close to two million acres of it. Cotton was the king of North Carolina, just as it was king throughout most of the Southland.

"And cotton was a tyrant in the South, making demands that were hard on both the people and the land. Cotton, in a world that was coming to be run by mechanical power, required hand labor, and from it an economy based on the unit of a man with a chopping hoe, or a man with a mule. Cotton decreed clean-tilling, and erosion followed the cotton rows, as night follows day, stripping the mantle of topsoil from millions of acres."

Continuing Secretary Anderson said, "Furthermore, too much cotton and the system of farming that cotton encourages, usurped acres needed for the development of the

(Continued On page 2 Col. 1)

Negroes Succeed in Georgia Page 6

Anderson Sees

(Continued from Page 1)

highly diversified agriculture of which the South is capable; it held back the production of milk, eggs, meat, and vegetables needed to provide a full nourishing diet for your farm and city people."

Pointing to the diversified farming program of North Carolina, the Secretary said, "But in the past 20 years the farmers of your State, among others, have made a declaration of independence. They still produce cotton—but they have been shifting the crop to the acres best suited for cotton. Cotton is no longer king in the State . .

"Today slightly more than half a million acres of cotton are being grown and it is more efficiently produced, resulting in higher yields. The land thus released has been used, along with other lands, to build a much more diversified agriculture. The pattern of the future—the kind of a pattern needed throughout the South—has been developed rapidly in the Tar Heel State."

Secretary Anderson pointed out that North Carolina has set an example for some other section by increasing its production of peanuts, eorn, milk, and poultry. "This means," he said "that your families are living better and are more secure. Both farmers and townspeople have benefited in the better diet produced from North Carolina's acres. And there has been a most satisfactory difference in the jingle of coins in the farmers' purse. Cash receipts from your diversified marketings mounted from about 250 million dollars of 20 years ago, to well over 600 million dollars in 1945."

Over Half South's

(Continued From Page 1)

for as much as 6 months of the year. This compared with an estimate of almost 80 per eent regular employment in the Northeast and North Central regions, and 45 per eent in the West. However, the wage rate in the West was substantially higher than that in the South. In fact, 71 per cent of the hired farm workers paid day rates in the West were receiving $4 per day or more, while only 9 per cent were receiving $4 per day or more in the South, and 36 per eent were receiving less than $2 per day.

The survey also shows that women, boys, and older men made up a large part of the South's farm labor force. Women numbered 121,000, boys under 18 numbered 87,000, and men over 45 totaled 185,000. Eighty-three per cent of all hired female workers were employed in the South as were 61 per cent of all boys employed on farms.

The report points out that wage rates are generally less standardized in agriculture than in industry. While piece rates for certain operations are said to be fairly uniform in some areas, the great majority of hired workers during March last year were reported to be paid on a time basis at a rate individually agreed upon by the farmer and the worker.

Negro Community

(Continued From Page 1)

acres under the soil conservation farming system.

Conservation technician for the area is Josephus Johnson, graduate of Tuskegee, who has been helping the farmers in the district with their soil problems since 1942.

President Hubert expresses the hope that the soil conservation eontest will include farmers in eight Central Georgia Soil Conservation districts next year, making the jamboree state-wide. Ultimately he expects to develop a national soil conservation observance for eolored farmers.

BACON STUFFED CELERY

Fill small stalks of celery with a mixture of grated American cheese, chili sauce and finely chopped, crisp bacon, blended until smooth.

Extension Service

(Continued From Page 1)

reviewed the growth of Negro Extension work from Mr. Campbell's appointment as first agent in 1906 until today when there are over 600 Negro agents.

P. O. Davis, Alabama Extension Service, told the students that "forty years ago, Tom Campbell was a student here like you are today and this testimonial in recognition of his service should be an inspiration to you." Mr. Davis made a unique contrast when he stated that Einstein propounded his theory from which came the atomic bomb about the time that Mr. Campbell began Extension work.. "They do not know what they are going to do with the atomic power, but we know what we are going to do with Tom Campbell. We are going to keep him in Extension Service, because of what he has done." The average farmer today, according to Mr. Davis, is producing two and a half times as much as farmers did when Mr. Campbell began work.

In his tribute to Mr. Campbell, Dr. L. N. Duncan, President of Auburn's Polytechnic Institute, Alabama, and former State Extension Director said: "I had the rare privilege of working very intimately with Mr. Campbell from the time he was appointed in 1906 until I left the Extension Service a few years ago. The total length of those years was around 30, about a third of a century, and in those years we were pioneering in a great educational enterprise. Those were rich and rare and delightful years working side by side with him."

H. H. Williamson, assistant director of the Agricultural Extension Service. Washington, D. C., came as the representative of Director M. L. Wilson, opened his remarks by reading a message from Director Wilson who recalled that forty years ago, two officials from the U. S. Department of Agriculture, Dr. J. A. Evans and Dr. Seaman A. Knapp, were traveling through the South to launch demonstration work for controlling the boll-weevil and "found" Tom Campbell.

"He was called from the plow," said the message, "in a time of calamity and in the ensuing years has contributed of his leadership nd faith in rural life to ease the lot of the country man."

Mr. Williamson, after reading the message, told his audience that records in the Washington office show that Mr. Campbell has received Agricultural Department ehecks for a longer uninterrupted period than any other worker in the Extension Service.

Mr. Campbell's pioneering in this branch of Government was referred to by Mr. Williamson as the "horseback and horse and buggy days" until passage of the Smith-Lever Act in 1914 and he added that "Tom Campbell's length of service" represents the historical stretch of the Extension Service.

On behalf of the Negro County Agents who originated the idea of presenting the bust and financed its making by Isaac Hathaway, director of the Institute's Division of Ceramics, W. T. Gravitt, agent at Huntsville, made the formal presentation of the bust to Dr. I. A. Derbigny, who in the absence of President F. D. Patterson, received it for the Institute.

President Patterson's message of felicitation said that "History will associate the name of T. M. Campbell with those of Seaman A. Knapp, Booker T. Washington and George W. Carver who made of their lives careers of service to the South and to the nation."

As a closing feature of the program, Mr. Hathaway, the sculptor, was presented and received an ovation.

The Banquet

President J. F. Drake of A. and M. Institute, Normal, Alabama, was guest speaker at a sumptuous banquet given in honor of Mr. and Mrs. Campbell and the Campbell children, some of whom have just returned from overseas service.

Dr. Drake reviewed the beginning of Mr. Campbell's work with the Jesup Wagon, an idea conceived by Booker T. Washington to earry. through practical demonstrations, improved farming methods direct to the rural areas and which Dr. Washington selected Mr. Campbell, then a student, to direct. The Jesup Wagon, said the speaker, was the predecessor of the Movable School and was begun eight years before Extension Service was established by the Federal Government.

"This idea of carrying education direct to the people was at that time, revolutionary," emphasized Dr. Drake and his remarks eontinued:

"Then education was something to be found largely in books and belonged in classrooms, or at least on the college campus. Certainly to fix up bundles of education and to place those bundles in a wagon and peddle them was unorthodox and a daring pioneer effort."

Albon L. Holsey, assistant to the president, was toastmaster and the following persons were presented: Dr. J. R. Otis, state leader of Negro Extension work in Alabama; Cornelius King, field representative, Farm Credit Administration, Kansas City, Missouri; Mrs. Laura R. Daly, Macon County Home Demonstration Agent; Col. Noel F. Parrish, Commanding Officer, Tuskegee Army Air Field; L. A. Potts, Institute Director of Agriculture; Lt. Col. Charity Adams, top ranking Negro WAC, just returned from active service in England and France; R. D. Morrison, agricultural director at A. and M. Institute, Normal, Alabama; Major J. B. Faulkner, recently returned from active service as chaplain at Camp Roberts in Liberia; Miss Elizabeth Campbell, physical therapist at the Institute Paralysis Center; Mrs. T. M. Campbell, who received a beautiful bouquet of flowers from the Negro Extension workers; Capt. Noel Campbell, just returned from overseas where she served as executive officer for Lt. Col. Adams; Capt. Thomas M. Campbell, Jr., Medical Unit, who arrived from overseas in the midst of the program honoring his father; Mr. Isaac Hathaway, the sculptor; J. H. Palmer, retired registrar of the Institute, and Nicholas Kollack, recently retired as state Extension worker.

Messages were read from Claude A. Barnett, Special Assistant to the Secretary of Agriculture and director of the Associated Negro Press; President F. D. Patterson, and Mrs. I. K. Rowan, State Home Agent, Prairie View, Texas.

Wake 4-H Club Achievement Day Successful Event

The City Auditorium in Raleigh was the scene of a County-Wide 4-H Club and Adult Achievement Day program Thursday, November 29, with a record breaking crowd of farm men and women, 4-H Club boys and girls in attendance. Aside from the large number of adults present, fourteen of the county's sixteen 4-H Clubs were on hand and accompanied by county school teachers and 4-H Club Leaders. Quality exhibits of canning, sewing, corn and tobacco were on display to compete for prizes being sponsored by Negro Business Concerns in Raleigh. The program got underway at 10:45, with W. C. Davenport, Negro Extension Agent of the State College Extension Service, presiding.

The main address was delivered by R. E. Jones, Negro State Agent, A. and T. College, Greensboro. "We are living in a changing world," said Mr. Jones, "and while we may be keeping step with the modern trend of agriculture today, I venture to say that eight or ten years hence we will have sided from them because of the new things we will learn in this modern agricultural era." Mr. Jones urged the continued cooperation on the part of Neighborhood Leaders until all farm families along the highways and byways are made a part of rural programs of which some of them may be in dire need. Other features included in the program were: Welcome address, James Russell Adams, Juniper Level 4-H Club; Response, Rev. John Manly, former 4-H Club member and student at Shaw University. Demonstration in selecting seed corn, Theron Perry, Wendell 4-H Club; demonstration in body measurements, Martha Ruth Cannady and Lula Mae Bledsoe, Fletchers Grove 4-H Club; Home Management Skit, Mrs. Margaret Green; Project reports, Mrs. Irma Dunn; report of county activities, Bartell Lane; Dress Revue, Mrs. Mattie Barbee and Mrs. Nevie Betts in charge.

4-H and Adult Prize Winners

Apex 4-H Club with 76 members present, won first prize of $5.00 in War Stamps. Corn club exhibits: 1st prize, Fletchers Grove 4-H Club, $5.00 in War Stamps; 2nd prize, Riley Hill 4-H Club, 1 year subscription to The Carolinian (Negro Weekly); 3rd prize, Springfield 4-H Club, 6 months subscription to The Carolinian. Individual corn entries: 1st prize, James Bledsoe, 75 baby chickens; 2nd prize, Jeremiah Leathers, 50 baby chickens; 3rd prize, Eugene Johns, 37 baby chickens. Individual tobacco entries: 1st prize, Edward Lee Cradle, 75 baby chickens; 2nd prize, Owen Hart Brown, 50 baby chickens; 3rd prize, Leroy Williams, 37 baby chickens.

Adult corn entries: 1st prize, R. B. Raiford, 75 baby chickens; end prize, Mark Dunn, 50 baby chickens; 3rd prize, J. E. Perry, 37 baby chickens. Tobacco: 1st prize, J. E. Perry, 75 baby chickens; 2nd prize, Matthew Wilson, 50 baby chickens; 3rd prize, Garfield Bryant, 37 baby chickens. The canning and clothing exhibits were judged on group basis. The 600 baby chickens, $10.00 in War Stamps and eighteen months newspaper subscriptions were sponsored by Negro Business Establishments of Raleigh.

County teachers present were: Mrs. Alma L. Harrison, Mrs. Beatrice F. Williams, Miss Ruby Sanders, Mrs. Margaret Adams, Mrs. Cornelia Dockery Cobb, Mrs. Frances O. Massenburg, Mrs. Pattie M. Smith, Mrs. Alma A. Williams, Mrs. Bessie W. Blue, Mrs. Vanzer Lee Bunch, Prof. W. W. Hurdle, Prof. James A. Watkins, and Prof. J. H. Cobb. Others present were Mrs. P. R. Jervay, Director of Home Economics Department, Shaw University; Mrs. Josephine Clanton, Dean of Women, Winston-Salem Teachers College, Winston-Salem; Prof. Malcolm Williams, principal, Crosby-Garfield School, Raleigh and C. G. Henry, U. S. Employment Service. Also students from the Home Economics Department of Shaw University.

Included on the judging staff were Miss W. R. Laws, Southeastern District Home Agent, Mr. Towler (white) Assistant County Agent and M. H. Crockett, Supt. D. D., and B. School. The Achievement Day was sponsored by Negro Extension Agents, W. C. Davenport, Mrs. Bertha M. Edwards and Miss Aurelia E. Jones.

Georgia Agricultural Extension Service Activities

By: A. S. BACON
Asst. Supervisor Negro Work

Negro county agents have been busy during the month making plans with Negro farmers and leaders for peace-time adjustments, according to P. H. Stone, State Agent for Negro Work of the Georgia Agricultural Extension Service. Achievement programs were sponsored. In these various meetings a review of the past year's work was made and tentative plans for the new year were discussed.

Agents reported that splendid cooperation was received in the Food for Peace Campaign. Sumter county agent alone reported over 700 cans of food were collected.

Returning veterans who are interested in farming have been greatly assisted by the agents. Assistance was rendered in securing financial and farm buying aid. Calhoun county agent reported that a veteran was aided in purchasing a farm and securing $100.00 per month foi twelve months to help with the operation of the farm.

Production of food is one of the major phases of work which is kept before the people. County agents have rendered invaluable assistance to farmers in cutting and curing meat. In Peach and Houston counties alone, thirty-two demonstrations were held in killing and curing meat.

Agents have aided in the conservation of soil fertility during the past month. The main activities have been terrace construction and pasture development. Early county agent reports that over 200,000 linear feet of terrace lines were run. Hancock county agent reports that ninety farmers are carrying on pasture development to some extent.

Youth has been brought into the activities through the 4-H Clubs that are under the supervision of the county agent. A group of four Landscape schools were held in Polk, Walton, Newton and Meriwether counties. The purpose of these schools was to train 4-H Club members and others in the art of home beautification. Special assistance was rendered in these schools by H. V. Harvey, Extension Horticulturist-Landscaping and Alexander Hurse, Negro State Club Agent.

Recreation and community life activities were carried out by groups meeting together and singing Christmas Carols and setting up community Christmas trees. This added much to the community life oi the people the agents are working with in the state.

Infantile Paralysis Strikes Anywhere

NEW YORK, Jan 26.—I have two children afflicted with infantile paralysis. The older a girl, contracted the disease at seven months and it was not until last April, when she was three years old, that one doctor found the eause of her illness. The younger child, a boy, has been siek now for about six months.. Where I live there is no medical aid for them_____I would like to take them to New York and enter them in one of your hospitals._____"

That paragraph is from a letter written by a young mother in Frederikstead, St. Croix, Virgin Islands. She sent it to the National Foundation for Infantile Paralysis immediately after reading It's a Fifty-fifty Chance," an article by Dr. Don W. Gudakunst, medical director of the National Foundation.

The matter was taken up with the Virgin Islands Chapter of the National Foundation. That chapter, like all other chapters of the foundation, upholds the pledge that no victim of infantile paralysis shall go unaided because of age, race, creed or color. The National Foundation's funds for aid to poliomyelitis patients are raised in the annual March of Dimes, January 14-31.

It was learned through the Virgin Islands Chapter that the cases reported by this mother had been investigated and one child had been diagnosed as having polio by a Virgin Islands physician. Arrangements were made to bring the child to New York for special treatments, at the expense of the National Foundation's Greater New York Chapter. The trip was made by boat to New Orleans and by train from there.

Extensive examinations made at a New York hospital clinie revealed that the child was not a polio case. While that medical report closed the case for the National Foundation, the medical authorities at the hospital suggested to the mother that she take the child for further treatment at a neurological clinic.

Wherever there is sufficient indication of infantile paralysis, the National Foundation spends dimes and dollars to aid the victim. It is the determination of his organization, founded by Franklin Delano Roosevelt, that polio shall be conquered. The people of America share in that determination, and through cantributions to the annual March of Dimes, January 14-31, take an active part in the unrelenting fight against the Great Crippler.

Anderson Says Mechanized Cotton Production May Force 3 Million To Seek Off-Farm Jobs

WASHINGTON, D. C.—Three million non-agricultural jobs will be needed for farm people who may be displaced by mechanized cotton production within the next few years, said Secretary of Agriculture Clinton P. Anderson, in an address last week in Anderson, S. C.

"Under conditions favorable to mechanized operations, tractors, mechanical cross cultivation, and mechanical picking can cut the man hours required to produce a bale of cotton to one-fifth the old requirements," the Secretary said.

"This," he added, "would mean that Southern farms will become larger and fewer, although not large-scale on the average. There will be fewer farm operators, sharecroppers, and hired hands to divide the farm income."

The Secretary's emphasis on the need for off-farm jobs was in line with a recent study made by Anderson County to determine the local employment opportunities which may be available for returning servicemen and displaced war workers.

"Anderson County is seeking," he said, "to provide off-farm employment and to broaden the base of its whole economy by encouraging the expansion of its present industries and the establishment of new businesses. . .

"This sort of planning lays a foundation for the solution of the cotton problem in human as well as economic terms, because the South cannot achieve a well-balanced use of its lands, and cannot assure the well-being of its people, unless it can find off-the-farm work for perhaps three million workers who won't be needed in mechanized agriculture five or ten years hence."

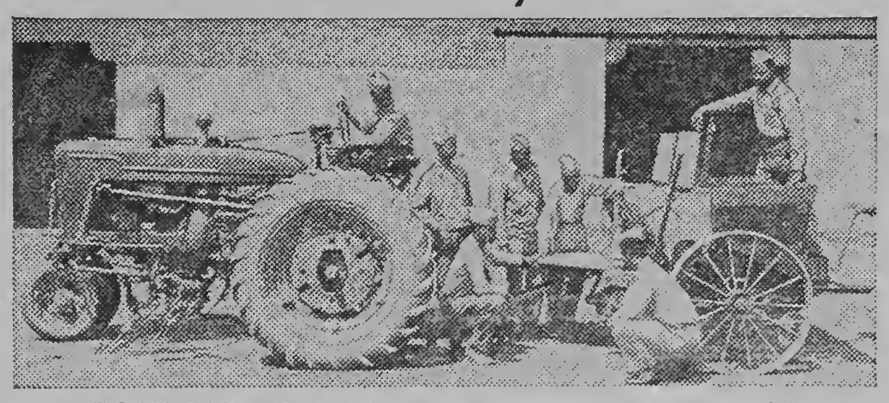
In reviewing the history of cotton which he said is one of the most valuable plants, Anderson pointed out that "King Cotton" hasn't been a benevolent despot. Said he: "King Cotton has been a thoroughgoing tyrant. He hasn't even been dependable in performing his supposed main function of providing needed cash income. The season's price for this one commodity has spelled either feast or famine—and too often the latter.

"Furthermore, the exactions of this monarch, who until recent date required much slow hand labor, has resulted in a pattern of small farms carrying a staggering weight of people engaged mostly in seasonal work. Even with high cotton prices the earnings per farm family generally average less than required for a decent living.

"This low limit on the earning capacity of many of your farmers and farm workers has denied them a truly American standard of living with good homes, telephones, automobiles, and electrical conveniences. Consequently they have not been as good customers of industry and business as they should be."

Secretary Anderson pointed to the diversification and industrialization as solutions to the South's cotton problem. "Livestock raising, dairying, grain production, and the raising of food crops," he declared, "are making giant strides in the South. . . . Practically all of the food and feed the South can produce is needed right on the farms and in the Southern cities."

St. Emma Cadets Study Potato Planter



ROCK CASTLE, VIRGINIA. The study of all types of farm equipment is a part of the course followed by the cadets in the Agricultural School at the St. Emma Military Academy. Here we see a class receiving instruction in the operation and repair of a tractor-drawn two-row potato planter. At planting time, these boys will go into the fields of the 2300-acre school farms and use this machine in a practical demonstration of what they have learned. Smaller equipment for one-man farms also receives much attention. Shown in the photograph, front row, kneeling, are Cadet George Thomas, age 17 (Rhode Island), and Cadet Charles Zomphier, age 17 (Missouri). Back row, left to right, Cadet Carlos Simmonds, age 17 (Maryland); Cpl. Edgar Redmond, age 17 (Dist. of Columbia); S/Sgt. Raphael Smith, age 17 (Connecticut); Cadet Wesley Cook, age 16 (Pennsylvania), and Bugler Sgt. Plater Campbell, age 17 (Dist. Columbia).

Saint Elmo Soldier Enlists In Regular Army While in France

Marseille, France, November 14—Private First Class Walter Dean, Saint Elmo, Tennessee, recently enlisted in the Regular Army of the United States for three years at Camp Tee Dee near here.

He entered the Army in April, 1942, and received his basic training at Fort McClellan, Ala. During his tour of duty overseas, Private Dean served in Africa, Italy, France and Germany with the 539th Engineer Dump Truck company. He wears the North African, the Rome-Arno and the Rhineland campaign stars.

The Saint Elmo soldier is the son of Mrs. Ella Deank, 52 Newcomer St.

Army To Move Cotton Surplus To Germany, Japan

Washington.—Word comes from the State Department that it has reversed its stand and is agreeable to moving of cotton into Germany and Japan.

Tentative plans call for the Army to purchase short staple cotton from the Commodity Credit Corporation. This cotton will be moved to Germany and spun on German spindles. The finished textiles will then be taken over by the Army. The Army will fill its own requirements for textiles and will sell sufficient finished textiles in southern and southeastern Europe to get the money back and repay CCC. What textiles are left over will be disposed of inside Germany under a plan to be worked out.

It is common knowledge that the Army resisted this plan with all of the power at its command and only agreed to go along after the President had made a direct request.

A similar plan has been put in operation by Russia.

Dairy Sharecropping Keeps Negro Farmers Out of Debt

WASHINGTON, D. C.—Colored sharecroppers of two South Carolina counties are cutting down on their customary credit at the plantation stores by sharecropping milk in addition to cotton, according to a report received recently by the U. S. Department of Agriculture from the South Carolina Extension Service.

About four years ago, the report points out that C. G. Cushman, State Extension dairy specialist, suggested that landlords in counties near the Borden milk plant at Chester develop a dairy sharecropping system to step up milk production.

Since that time it is said that several landlords have begun milk sharecropping programs. Under the plan sharecropper families handle, feed, and milk six to eight cows. In return the sharecropper receives 50 per cent of milk receipts. This averages about $15 every two weeks.

Sharecroppers grow most of the feed for the cows. Pastures are enlarged by reducing the woodland areas. The cost of purchased feeds is deducted from the milk receipts before the money is divided on a 50-50 basis.

In one community in Chester county, the landlord also shares the calves with the croppers. Most of the male calves are sold, and the proceeds are shared equally. Heifer calves are kept to replenish the herd. They are divided alternately between land lord and cropper. One colored farmer, Jordan Straford, now has six cows of his own. There are eight sharecroppers on the plantation with Stradford and it is pointed out that within a few years all of them will have herds of their own.

The plan is said to be a success both in Fairfield and Chester counties. And the sharecroppers like it because it provides them with some cash money every two weeks, and the manure from the cow barns can be used to build up the fertility of the soil for their cotton crop. It is estimated that a sharecropper who sells 10 gallons of milk a day nets as much from his milk as he would from 10 bales of cotton.

M. L. Wilson, director of Extension work of the U. S. Department of Agriculture, says that this new sharecropping plan is in line with the general policy recommended for farming in the South. These recommendations include diversification of crops, substitutes for cotton as a crop, off-farm employment during the slack seasons, and growing food at home for the family.

Mrs. Mary M. Bethune Thrills Large Crowd In Address Here

"Making Democracy Live," Was Subject of Brilliant Speach Delivered Under Auspices of Southern Conference For Human Welfare

Having been brought here under the auspices of the Southern Conference for Human Welfare, which was sponsored not only by this organization but by more than one hundred representative citizens of all races, all denominations, business and professional men and club women, Mrs. Mary McLeod Bethune thrilled one of the largest audiences that has ever gathered in Spruce Street Baptist church of this city. It was a city-wide movement. The honored visitor and guest speaker however, is not a stranger to Nashville audiences. She has viisted this capital city many times, and Dr. James A. Dombrowski and his coworkers expressed themselves as thoroughly delighted with her presence.

Mrs. Bethune arrived in Nashville on Wednesday night by plane directly from the nation's capital, and was domiciled at the home of Mrs. Frankie Pierce and her niece, Mrs. Nellie Francis. Prior to her main event and public appearance she was the guest of the International House on Fisk University campus, where she thrilled an audience of members of the faculty and student body at Fisk.

Mrs. Bethune has the honorary degree of Ph. D., she formerly headed the N. Y. A., Movement in the nation's capital.

The program began promptly at 8:00 p. m. The guest speaker and the persons on the program met in the reception room of the church, and at 7:50 they filed down the aisle led by Secretary Dombrowski, who was followed by Mrs. Bethune Bishop Frances J. McConnell, Dr. Alva W. Taylor, Mrs. Frankie Pierce, Rev. Henry A. Boyd and Dr. R. W. Riley. While they were marching down the aisle the huge pipe organ pealed out its lovely tones to the artistic touch of Mr. Robert L. Harrison. When they were seated on the platform, Mrs. Frankie Pierce announced that the program would begin. The audience stood and sang "America," led by the Spruce Street Church choir When the strains of music had died away and the voices were hushed, silence reigned; then Bishop Francis J. McConnell worded a fervent, eloquent prayer for the entire occasion. He led them up close to the throne in his beautiful appeal and supplication. Then the choir sang "Hark, Hark My Soul," followed by "The King of Love My Shepherd Is." Dr. Alva W. Taylor then spoke on "The Southern Conference for Human Welfare." In the ten minutes expose of the purpose of such an organization which envelops the southland, and which he said was destined to break over the borders wherever men and women, regardless of race, creed or color, wanted justice done, equal opportunities presented and laws upheld.

Secretary Boyd then arose and simply said: "Mme Chairman and to this intelligent and vast presence, it gives me pleasure to present the founder and builder of Bethune-Cookman College in Daytona Beach, Fla., its president emeritus and a national character, Mme Mary McLeod Bethune. The vast audience stood and cheered, then the guest with her charming personality, well-gowned befitting the occasion, wearing a huge corsage of orchids that was presented to her by one of her admirers, began her address on "Making Democracy Live."

Nashville gave her a real hand. It was one of those never-to-be-forgotten occasions, and in spite of the fact that she was scheduled to leave at 10:45 on a trip further south, she took her time, drove her argument home, kept her audience spellbound, in spite of the repeated outburst of applause as she reached from climax to climax.

Following the address the membership drive was on and an offering was lifted, led by Mr. E. T. Brown, who was assisted by twenty men selected from the audience, who brought back the envelopes with the names of the applicants along with the cash, which was turned over to the organization, who counted and tallied the amount. Rev. R. W. Wiley, president of the American Baptist Theological Seminary, pronounced the benediction. Following this there was a rush to the platform by hundreds of people, because there were not seats enough to accommodate them, notwithstanding all the chairs were brought out of the Sunday school auditorium, the galleries were filled and chairs placed down the aisles. All wanted to shake hands with Mrs. Mary McLeod Bethune and each complimented her on her address.

The Southern Conference for Human Welfare had placed in the seats for each person a printed program, along with a copy of The Southern Patriot, and another publication reprinted from two comic magazines, with an envelope that they could use for their donations.

The program carried some of the names of the sponsors as follows:

SPONSORS

Louis A. Alexander, Mr. and Mrs. A. L. Allen, George H. Anderson, Dr .and Mrs. William K. Anderson, Mrs. Blanche Armstrong, Dr. Roy Battenhouse, Dr. and Mrs. W. A. A school teacher who had been telling a class of small pupils the story of the discovery of America by Columbus, ended it with, "All this happened more than four hundred years ago."

A little boy, his eyes wide open with wonder, said, after a moment's thought, "What a memory you

Chicory growing began in this country in 1885.

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.

Giles A. Hubert _____Editor
Sadie Wilson _____ Secretary
Henry Allen Boyd_____ Publisher
Office, 403 Charlotte Avenue.

Devoted to the interests of the Farmer, Truck Gardner, Livestock and Poultry, Breeder, the Home and the People.

Entered as Second Class Matter, April 10, 1929, at the Post Office at Nashville, Tenn., under act of March 3, 1879.

All contributions for publication in the Modern Farmer, should be addressed to The Modern Farmer, 403 Charlotte Avenue, Nashville 3, Tenn.

No libelous matter will be published. Unsigned articles or letters, and those written on both sides of the paper will not be used.

Subscription price $1.00 per year, 75c for six months, payable in advance. Personal checks must be certified. Make all checks or money orders payable to The Modern Farmer.

Advertising rates and sworn circulation figures presented upon application.

So Back to the Farm

(Continued From Page 1)

ton sharecroppers must compete for the new areas with people already familiar with the type of agriculture adaptable to the new regions.

I surely have no disagreement with the idea of developing land owning, progressive Negro agricultural communities. I have fostered this for many years, have written to this end in these columns and have worked to get many such communities established and reinforced, with the aid of the Farm Security Administration. Gee's Bend, Alabama; Silver Ridge, Sevier County, Arkansas, and the Denmark Community in Tennessee are examples of some tangible results in this regard.

But these programs, as well as that of the Log Cabin Community in Georgia, must involve larger farms and increased capitalization and fewer families. Thousands of families will still have to leave a rationalized southern agriculture—and I have not even mentioned the cotton picking machine.

Full employment in industry, North and South, is the greatest hope of maintaining and improving the lot of the farmer. **Fair employment practices** under conditions of full employment is a large part of the solution. This will drain off excess rural population and provide these people with higher income levels than could in any way be possible if they remained on farms.

The other part of the solution is the helping of these farmers who remain to reorganize their farms so that they can produce on a competitive basis—larger farms, balanced farming programs, adequate capital facilities and guidance.

This latter is the job of the South's rural leadership. The former part is the job of urban leadership. Taken together it is a national problem requiring the best in statesmanship.

It is truly a good omen that big city writers are becoming concerned with this problem. Perhaps they will give more and more prominent space to agricultural writers in the columns of the big city newspapers; that is, writers who have been acquainted with and writing about these problems for years. Surely, let us not have a return now to the old "back-to-the-farm" notion. There is no hope for this in the long-run future of the Negro.

On the Agricultural Front

NEGRO FARMERS BUYING MACHINERY COOPERATIVELY

Because their small farms do not warrant the purchase of tractors and other heavy farm machinery on an individual basis, colored farmers in several areas who operate small acreages are buying their equipment cooperatively, according to reports received by the U. S. Department of Agriculture from State Extension Service directors.

In North Carolina, for example, colored farmers in one county recently purchased nine new threshers, four hay balers, and two tractors on a cooperative basis. In Georgia, colored farmers are buying peanut pickers cooperatively; in Mississippi and Arkansas, colored farmers are buying tractors and mechanical cotton choppers on a cooperative basis.

It is pointed out that cooperative purchasing of mechanical cotton pickers, when mass production of these machines get fully underway, may be the means by which many colored farmers can survive the mechanization of cotton growing.

4-H CLUBS GET AWARD

In recognition of the more than 200 million dollars worth of Bonds and Stamps sold or bought by 4-H Club members, the Treasury Department has presented a certificate of award to 4-H Clubs. M. L. Wilson, Director of Extension, accepted the award on behalf of the 1,700,000 4-H'ers. Of these, 277,563 are colored.

SHORTAGE OF CHRISTMAS HOLLY

The severe late frosts of last spring and the heavy rainfall that followed—which caused the shortest apple crop in history in the Eastern States—also caused a failure of the holly crop in that region, foresters of the U. S. Department of Agriculture report.

The frosts destroyed the late flower buds and the heavy rains interfered with pollination of the blossoms. As a result almost no red berries are to be found on holly in Maryland, Delaware, and Virginia—the States that usually furnish the bulk of the holly on Christmas markets in the East.

KY. COLORED FARMERS HAVE 8 POINT PROGRAM

An eight-point program has been set up in Kentucky to help the small farmers of that State, including many colored farmers, to develop balanced farming practices, according to a report received by the U. S. Department of Agriculture.

The program is as follows: (1) A year-round garden, (2) supply of poultry and eggs for home use, (3) hogs for home supply of pork and pork products, (4) cows to provide adequate supply of milk for home use, (5) cereal grains for family food and livestock feed, (6) grasses and legumes for pasture and soil improvement, (7) tobacco for cash crop, and (8) surplus poultry and dairy products and hogs for market.

A LOOK AT 1946

Sufficient food will be available to make it possible for the average American to be at least as well fed in 1946 as he was in '45, say food economists of the U. S. Department of Agriculture. The latest forecast of these food economists is for a relatively high civilian level of nutrition for the country as a whole during the coming year, assuming that commercial food production continues large, that families continue to have home gardens, and that any surplus foods are well distributed.

As for jobs on farms, the outlook is relatively bright especially for seasonal labor. Among the factors which will determine the extent to which farm workers may find jobs is the rate at which servicemen and war workers return to the farm. About 900,000 men from farms entered the armed forces. A significant proportion of these may not return to the farm immediately. Prospects of non-farm jobs may cause many of them to turn toward urban areas. The speed of reconversion and the peacetime level of employment in industry will determine whether or not war workers from rural communities trek back to the farm next year.

It is thought that the net increase in farm workers will be small, but the average quality of the workers will be better than during the war years.

The outlook for rural schools next year is reported as encouraging by the U. S. Department of Agriculture. The Department points out that the chances are strong that by next fall the quality of teaching in rural schools will be much improved over that of the war years. Consolidation and reduction in the number of one-room schools is expected to be speeded up during 1946.

On the other hand, rural health facilities in 1946 are likely to continue to be very scarce. Doctors, dentists, and nurses are not all returning to their former rural communities. Some are turning to urban areas where they find the prospective income more attractive and facilities more adequate.

It is pointed out that construction of modern rural hospitals and health centers is a prerequisite to attracting and distributing health personnel and to assuring a high level of quality service. An expanded public health program must go hand in hand with the construction of facilities if preventable diseases are to be markedly reduced, the Department believes.

STUDY COTTON PROGRAM

Cotton farmers are studying the seven-point cotton program which was drawn up recently at a regional meeting held in Memphis. Here are the seven points: (1) Fit cotton into balanced farming, (2) take care of your soil, (3) get together on the best local variety, (4) make your labor count, (5) control insects and diseases, (6) pick and gin for high grade, and (7) sell for grade and staple value.

North Carolina is the third largest egg producing State on the Atlantic Seaboard. Pennsylvania and New York are first and second respectively in this region.

Time For Inventory and Planning

One criticism which is valid with regard to Negro agricultural leadership is that it has not come forward with a clear and comprehensive and unified program for the Negro farmer in the present crisis. Such a program must take account of the impending reorganization of Southern agriculture as it rationalizes to progress in scientific applications, mechanization and new market openings created by increased urbanization in the South.

It must take account of population displacement and guidance of such population toward new occupations. It must involve the sources of capital and information available to help farmers make proper re-adjustments and reorganization of their farms and way of life. It must include improvement of legal and contractual relationships between landlord and tenant and between employer and employee in agriculture which make for greater security and mutual progress.

Out of the experience of the depression and the war years, Negro agricultural leaders have learned a great deal. Experiments have been made which can point the way toward a better situation for our farm population. Some of these have demonstrated the feasibility of new ideas and new techniques or have confirmed the workability of old ones.

It is time that Negro agricultural leadership should get together, compare notes, make an inventory and come up with a program which is workable and progressive. Two years from now will be too late. **Let's do something about this soon.**

Veterans Crop Quotas Bill Is Introduced

Washington, Jan. 19—(Special)—A bill to provide acreage allotments and marketing quotas of tobacco, corn, wheat, cotton, rice and peanuts for veterans of World War II has been introduced in the House by Rep. Estes Kefauver of the Third Tennessee District.

The bill, if passed, will entitle any veteran who owned or operated a farm under the Agricultural Adjustment Act before entering active military or naval service "to have an allotment or quota for the same farm for the same crop or crops for each of the succeeding five years beginning with the marketing year (not later than the third marketing year beginning after the date of such veteran's discharge or release from active service" specific in the application he files with the local committee.

The bill provides that this allotment or quota will be equal to the allotment for "such farm at the time such veteran entered active service in the military or naval forces of the United States plus such additional allotments or quotas as would have been allowed such farm if, during the veteran's active service, such farm had been in maximum production of the crop or crops with respect to which application is made."

The bill also includes the following:

"Notwithstanding any other provision of law the Secretary of Agriculture is authorized and directed to apportion through local and state committees farm marketing quotas or acreage allotments for tobacco, corn, wheat, cotton, rice, and peanuts to veterans who are not entitled to allotments or quotas under the first section of this Act and who desire to become bona fide producers of tobacco, corn, wheat, cotton, rice or peanuts, as the case may be. Such quotas and allotments shall be in such amount as are necessary to enable veterans to become bona fide producers of such crops.

"As used in this Act the term 'veteran' means any individual who served in the military or naval forces of the United States after September 8, 1939, and prior to six months after the date of the termination of the present war as proclaimed by the President."

Bilbo—'UnChristian'

"UnChristian" was the condemnation directed at Senator Bilbo by Methodist women leaders from nine Southern states, including Mississippi. The resolution, proposed by Mrs. M. E. Tilly and adopted at a meeting in Lake Junaluska, N. C., read:

"Realizing the great necessity for the promotion of plans that will bind our nation together into one united group, and realizing that when one single group of citizens is singled out for discrimination and attack, the whole peace and unity of the nation is threatened, and that when it comes from Congress halls it has both a direct and indirect bearing upon the peace of the world,

"We, Methodist women from the nine Southern states, in the seminar on Christian Social Relations, in session this day deplore and condemn the filibuster of Sen. Theodore G. Bilbo against the Fair Employment Practice Committee, made as an attempt to thwart the onward march of democracy; and we further condemn such use of Senate time as a tragic waste of taxpayer's money.

"We are bowed in contrition that a senator of our South could so forget himself as to be so unChristian and ungentlemanly as to address anyone with the title of an offensive epithet. We deplore and condemn the violent and abusive attack made by Sen. James O. Eastland upon our American Negroes in the armed forces, who with the other youth of our land, are giving their lives for the sake of us all. We particularly deplore that such a speech was made by a senator of our South.

"We want the outside world to know that such practices and tactics do not have the sanction of the Christian South. We make these pronouncements in the Name of Him who came that we might be one, and that life—more abundant life—might be for all."

Jas. G. Patton Urges World Commodity Credit Corp.

Washington, D. C.—The United States should take the lead in setting up a World Commodity Credit Corporation, which is needed to finance world crop movements, declared Jas. G. Patton following a recent visit to the White House, where he urged the President to direct Secretary of Agriculture Anderson to prepare proposals for such an organization, to be submitted to member nations of the United Nations Organization.

It is reported that nearly 1,900 rural and urban Americans were killed in their homes last year by gas from their stoves and furnaces—wood burners, coal burners, and gas burners.

Virginia gained 3,725 farms and 135,856 acres in farmlands during the period between 1940 and 1945.

A cotton export advisory board has been established by Secretary of Agriculture Clinton P. Anderson to help develop a program for the disposal of surplus U. S. cotton.

ENDORSE MARCH OF DIMES

The Charioteers, popular radio-stage entertainers, are "way out front" in the March of Dimes, nation-wide appeal of the National Foundation for Infantile Paralysis, January 14-31. It is the determination of the National Foundation that poliomyelitis shall be conquered and that no victim of this dreaded disease shall go without aid, regardless of age, race, creed or color.

Your contribution to the 1946 March of Dimes will help build a living memorial to Franklin Delano Roosevelt, founder of the National Foundation. Concerts throughout the nation on January 30 will replace ballroom celebrations and are dedicated to the memory of the great war president.

Farmers Stake In Strikes

The country is in the midst of another one of those struggles which only democracies can produce. This time it is over what is a fair division of the earnings of industry as between the workers and owners. To force a settlement in their favor both seem to have gone on a strike. The workers have openly declared for a strike. The owners while not openly declaring for a strike, seem nevertheless to have decided to stage one just as much as the workers. They have little reason to worry about any losses because of stoppage of work, for all such losses are covered by the Federal government. This is provided for by the recapture clause of the present tax law which has a provision requiring the government to reimburse a corporation formally engaged in war production for any losses that it may have during the year of 1945 and '46 which can be covered by refunds from taxes paid by that concern during the four years of the war. Thus, industry can sit back and let the strike go on: the workers and the public and the tax payers may have something to worry about but not the industrial concern.

And farmers should make no mistake as to which side of their bread is buttered in this strike business. Unions seeking a greater share of the earnings of industry make up the vast bulk of farmers' customers. If wages go down the farmers market goes with them. Roughly 85 per cent of United States farmers' customers are wage earners. What happens to the wages of the people determines what happens to prices farmers can expect (unless government subsidies make up the difference) to get for what they sell.

A lot of nonsense is put out about higher wages raising the prices that farmers will have to pay for what they buy. I am reliably informed that labor cost of a tractor is about five per cent of the price that a farmer has to pay when he buys one. Before the war, it required 27 hours of labor to make a Ford automobile. These facts may be the reason why management refuses to show their books, or to reveal what their profits were.

(Editorial from The Southern Farmer)

On the Agricultural Front

HOW RURAL AREAS CAN ATTRACT NURSES

Washington, D. C., Jan. 21, 1946: Pointing out the need for more trained nurses, in addition to doctors, dentists, and health facilities in rural communities, the U. S. Department of Agriculture suggests ways by which nurses may be attracted into the hinterlands.

The Department says the supply of nurses in rural areas is just as short as the supply of doctors. It points out that even in 1940 the rural State of Mississippi had only 62 active nurses per 100,000 of its population, while industrial Massachusetts had 403 nurses per 100,000 people.

The comparison of colored nurses for the colored population of Mississippi with that of Massachusetts is even more disparaging. The 1940 census shows that there were only 12 trained colored nurses and student nurses per 100,000 colored population in the State of Mississippi. In Massachusetts there were eight times as many colored nurses for the same number of people, and in New York, there were 23 times as many trained colored nurses and student nurses per 100,000 colored population as in Mississippi.

The Department of Agriculture suggests that rural communities may attract trained nurses by having an adequate number of physicians and modern hospital facilities. It suggests also that rural hospitals make arrangements with nurses training schools to have student nurses join their staffs to do part of their training. It is thought that such experience might lead some of the nurses to return to rural communities upon graduation.

8,000 WEST INDIES WORKERS NOW ON FARMS

There are only 4,682 Jamaicans and 3,772 Bahamians now employed on farms in this country, the Office of Labor of the U. S. Department of Agriculture reports.

As the need arises, the Office of Labor plans to bring in other West Indies farm workers. The number may run as high as 15,000 at the peak of the farming season. During last July, there were nearly 30,000 West Indies workers employed on farms here. But with more domestic workers expected to be available this year, Department officials do not believe that the need for outside workers will be as great this year as last.

HOLD SOIL CLINICS FOR COLORED FARMERS

A series of soil clinics are to be held in Oklahoma to help the colored farmers of that State to understand more fully the importance of various soil and water conservation measures.

The first clinic was held several weeks ago near Langston. It was sponsored by the supervisors of the Cottonwood Creek Soil Conservation District of Guthrie, Oklahoma. Colored county agents, vocational agriculture teachers, and conservation group leaders were in attendance.

Paul Brooks, colored district leader of Extension Service, plans to hold a series of similar clinics in colored communities throughout the State.

ARKANSAS ANNOUNCES COLORED 4-H WINNERS

Arkansas State Extension Service has announced the colored 4-H winners of achievement awards for outstanding agricultural effort during 1945. John W. Banks of Marion, Arkansas, and Miss Thelma Collier of Marianna received the first place awards for boys and girls. Award for the most outstanding colored 4 H Club in the State went to the Dudley Lake Club of Jefferson County.

FOOD OUTLOOK GOOD

Civilian food supplies will be at near record level during the next few months, despite substantial exports of food. This results from the great reduction in military procurement. The total food supply continues much larger than in the prewar years.

Supplies of many foods are expected to meet civilian demand in full in most areas at or perhaps even below ceiling prices. Among these are most cereal products, citrus fruit, canned fruit juices, fresh and canned vegetables, evaporated milk, fluid milk, frozen fish, eggs and potatoes. Some foods may be more plentiful than before the war, but still short of what civilians would like to buy. These include meats, cheese, and perhaps canned fruits. Supplies of sugar, fats, canned fish, apples, and bananas will continue to be smaller than the quantities consumed before the war.

ANDERSON SAYS CO OPS IMPORTANT TO FAMILY FARM

The importance of farm cooperatives to the maintenance and improvement of the family farm was emphasized by Secretary of Agriculture Clinton P. Anderson in an address before the National Council of Farmer Cooperatives Annual meeting in Chicago, recently.

Pointing out that farmers and other small businessmen of today must operate in a world of economic giants, Secretary Anderson said that cooperatives must come to play an increasingly important role in farm life and farm business, if we are to maintain and improve the family farm, and if we are to adapt it to the high-powered economy into which we are speeding. He estimated that fully half of the farmers of the United States are members of co operative associations.

Said the Secretary, "I believe there is little doubt that except for the power of the American farm tradition, the growth of cooperation, and the definite deep rooted Federal and State policy of encouraging the family type farm as something of fundamental national strength, the big corporations might have taken over as much of agriculture as they have of other parts of our economy."

Secretary Anderson said that the farmer has used cooperatives and cooperative organizations, together with agricultural research, educational programs of the Federal-State Extension Service, soil conservation programs, and other programs to maintain the family-type farm. Emphasizing cooperatives, and cooperative organizations, the Secretary declared that these have been the constructive means by which both farmers and small businessmen have maintained themselves, achieved efficiency in buying and selling, and sought to gain the advantages of bigness without the disadvantages.

Continuing, the Secretary added, "We want to aim for maintenance and improvement of the family farm. We want it to be a fully productive, highly efficient farm—but we want it to be the traditional family type, capable of holding its own in our economy, capable of maintaining farm and home as a way of life. We want it to fit into a national pattern of a fully productive agriculture, turning out vast amounts of high quality food and fiber, capable of supplying the nation with a bountiful diet at a reasonable cost.

"We definitely don't want our farms to become soul less factories, owned by impersonal stockholders and operated by hired managers and hired workers, with success or failure measured entirely by dollars and cents figures in company ledgers. To allow our machines and our impetus toward bigness to bring that about would be to take the American spirit out of farming it; it would mean relinquishing the solid values of farm life that we have prized highly since the first settlers put the plow to the fresh soil of this continent. . . .

"I think it is absolutely essential that we give serious thought to the possibilities of the future in agriculture and determine the ways in which cooperatives can increase their aid to farmers in achieving the kind of agriculture we will need, and can aid the public even more in realizing to the full the benefits of our productive agriculture."

COLORED EXTENSION AGENTS STUDY RURAL HOUSING

A series of housing conferences are being held in North Carolina for the colored Extension Service farm and home agents, according to reports received by the U. S. Department of Agriculture.

The conferences are under the direction of Miss Pauline Gordon, specialist in home management and house furnishings, and John Harris, who has prepared a bulletin on homestead planning. The conferences deal with the arrangement and location of farm buildings, and the proper planning of grounds, walks, and driveways.

WEST INDIES WORKERS NOW DOWN TO 9,000

West Indies agricultural workers who numbered nearly 30,000 during the summer are now down to 9,600, according to the most recent report from the Office of Labor of the U. S. Department of Agriculture.

Unless the program is renewed for another year, it is said that all of the West Indies workers are expected to be en route home by the end of this month.

At present the main concentration of West Indies farm workers is to be found in Florida where 2,242 Jamaicans are employed in sugarcane, and 4,079 Bahamians are employed on truck farms.

ETHIOPIA ENCOURAGES COTTON PRODUCTION

Haile Selassie Emperor of Ethiopia is encouraging increased cotton production in that country to supply the cotton mills there, according to the Ethiopian Commercial Industrial and Agricultural Journal which began publication last May.

Said the Emperor, "Those of you with land suitable for the cultivation of cotton should plant this crop. Our cotton mills can use the cotton you produce."

The Journal points out that the principal crops now grown in Ethiopia are cotton, sugarcane, date palms, coffee, tea, rubber, tobacco, cereals, fruits and vegetables. Livestock and beeswax production are being encouraged. At present the country exports over 400 tons of beeswax a year.

Ethiopia's area is estimated at 350,000 square miles, nearly a third larger than the State of Texas. The population of the country is roughly 12,500,000.

MINISTERS TAKE LEAD IN SOIL CONSERVATION

Recognizing the importance of conserving the soil, some of the colored ministers in South Carolina have launched a program to encourage soil and water conservation as their rural project for the coming year, according to reports received by the U. S. Department of Agriculture from SCS personnel in South Carolina.

The movement was started by the Rev. James Thomas state director of the Home Mission Council of Negroes. He is sponsoring a special conservation project in Chester County S. C. Four community leaders are working with him.

'46 FARM PRODUCTION GOALS

Secretary of Agriculture Clinton P. Anderson has announced his recommended national farm production goals for 1946. These goals call for a total acreage of 356,244,000 acreas, or five-and-a-half million acres more than the indicated acreage actually planted in crops this year.

The largest percentage increase in goal acreages is suggested for sugar beets—31 percent over last year's goal; sugarcane acreage is boosted eight percent.

The cotton acreage goal is set at 20 million acreas, something over a million-and-a-half acres more than the indicated acreage for this year which reached a 60-year low.

Sweetpotato goal suggested for next year is 751,000 acres, about four percent above this year's crop. Increases are set for all types of tobacco except burley. The suggested milk production goal is down two percent as compared with this year's indicated production; and the egg goal is down 13 percent. However, the goal of 3,910 million dozen eggs is still 20 percent above the 1937-41 average.

These recommended goals will be considered at State Agricultural meetings during this month. Final goals will be announced around the first of the year.

MITCHELL ATTENDS OUTLOOK MEETING

John W. Mitchell, federal extension field agent with headquarters at Hampton Institute, was in Washington last week attending the Annual Agricultural Outlook Conference.

Among the issues discussed at the conference were: Postwar Agriculture and Employment, Economic Aspects of Housing, and the outlook for industry, business, and agriculture.

Following the conference, Mr. Mitchell left for conferences in North Carolina and at Tuskegee where he will pass on to the groups there some of the facts brought out at the Outlook meeting.

Negroes Succeed In Georgia

Good Manners—Expressed in Life Help to Make Heaven on Earth—Stimulating Examples: Abraham Lincoln, Booker Washington, H. Hansell Hillyer, Harmon W. Caldwell, Donald Thomas, Reverend W. C. Davis and Sydney A Jones.

BY BENJAMIN F. HUBERT

Good manners is one of the finest of the human arts and possessions. In our resolutions for 1946, it would be well to include good manners. If each individual of the whole human family, regardless of circumstances, and on all occasions, would exhibit the best of good manners in his associations with his fellowmen, it would be a great step forward in human relations. It is most disturbing and distressing to find human beings who seem ever anxious to "rub people the wrong way." Rudeness, lack of respect for the welfare and comfort of others, never a kind word or a helpful life to the man next door, tend to make life, for all of us, not quite what it should be. We cry for world peace, but universal peace will never be a reality until every man exhibits and expresses a wholesome respect for and generous concern about every other member of the human family. Whether we like it or not, really "Big Folks," regardless of station in life, are already earmarked by the quality of their souls as expressed toward their fellowman through life's daily contacts. Neither poverty nor riches can ever be used as an excuse for bad manners.

Must Begin at Home

Good manners must have its beginning in the home. In my own farm home in Middle Georgia, my mother always cautioned the children, when going out, "Now don't forget your manners." "Always remember that you are a Hubert!" She was, in her quiet unassuming way, challenging the children to live up to the good teaching and the good name of their parents. She was telling them that they could not afford to reflect dishonor upon those who were living, only for them, and in them, by not being real upstanding ladies and gentlemen.

During the Christmas holidays, I had opportunity to congratulate the mother of a girl in the freshman class at Georgia State College. Her daughter had impressed every one at the college with evidence of her refinement and culture by her courteous, exemplary conduct. I asked the mother how she was able to rear such splendid children and such a drab and uninviting environment. She quickly replied, "I suppose it is just in the bones." This mother knows that her daughter is not only born well, but that this child is only a faint expression of her own ideals of what a young woman could and should be—her flesh and blood, refashioned and improved by her sacrifices, prayers, precepts and constant, daily, helpful stimulating example. We are largely, what our mothers want us to be. It is truthfully said that "The hand that rocks the cradle rules the world."

A Great Human Need

There is an ever increasing need in the world today for men and women who not only use "Good manners" as the best possible personal strategy in life, but who make it a valued and fundamental part of their own lives. We need in the world—the handshake that means something—the smile that is not just a veneer but an expression of the feelings of the innermost soul— the willingness to give a word of cheer to others—the will to give the other fellow the long end of the stick when lifting a load—more people who constantly exert an uplifting pull—a realistic love that radiates from every part of us and makes men know that there is a little bit of God in us—we need more folks who realize with Robert Browning that "God's in His heaven and all's right with the world." Heaven is very near when there is a spark of spontaneous, generous love in the heart of every man, woman and child for every other human being, provided this love is reflected in our daily life.

In public places, on our streets and highways, on our public conveyances, in our law enforcement departments, in the home and school room, there is the ever present need of men and women who have the spirit and will to help others put their best foot forward!

Great Stimulating Examples

Abraham Lincoln—No man was more maligned than this great soul. But his great moral courage farseeing vision, deep humility, understanding love and easy, warm common touch, represent a source of consolation and strength and a great alltime challenge to the whole world today. No man was too poor, or too low in the scale of life to live beyond his sympathetic reach. Regardless to the turmoil and strife about him, he said, "I do the very best I know how; the very best I can, and mean to keep doing so until the end. If the end brings me out all right, what is said against me won't amount to anything. If the end brings me out wrong, ten angels swearing I was right would make no difference."

Booker T. Washington, born a slave, amid poverty, racial strife and hatred, rose to the high pinnacle where he could smile at attempted insults and declare that he would let no man drag him down so low as to make him hate him. Booker Washington will grow bigger and more appealing as the ages pass. He had a great all-embracing heart. He was ever ready to overlook the shortcomings and failures he found in others and exert himself to pull all men to a higher level of living.

Some folks seem to be too narrow across the chest and self-centered to accord a small measure of praise and appreciation for the efforts of others. They cry for positions of leadership in life but they forget that men cannot be "Big" and "Little" or "in front" and "in the rear" at the same time.

H. Hansell Hillyer, outstanding liberal and progressive business executive, Georgia-born president of the Savannah-St. Augustine Gas Company, in writing to the St. Louis Post Dispatch, said . . ., "I think Dr. Hubert and his weekly column constitute the finest single job I know in the development of sound, racial relations in the area dominated by the Savannah Morning News, and it seems to me that great dalies like the St. Louis Post Dispatch and similar leaders in Detroit, Chicago, Cleveland, Pittsburgh, etc., might recognize their wisdom and value as a very real contribution to be made to our national welfare."

Dr. Harmon W. Caldwell, native son of rural Georgia, unassuming, brilliant, outstanding and achieving, head of the great University of Georgia, writes, "It was an inspiration to me to visit the Log Cabin Community last month. I had no idea that so much splendid work was being done there. You, your sister, and your associates are to be congratulated on the fine leadership that you have given to that section of our state. I wish that we had other communities of a similar high quality of leadership. I not only want to congratulate you but as a citizen of Georgia I want to thank you for the work that you are doing for the upbuilding of our state and its people." His good breeding and training forced him to recognize merit among colored people.

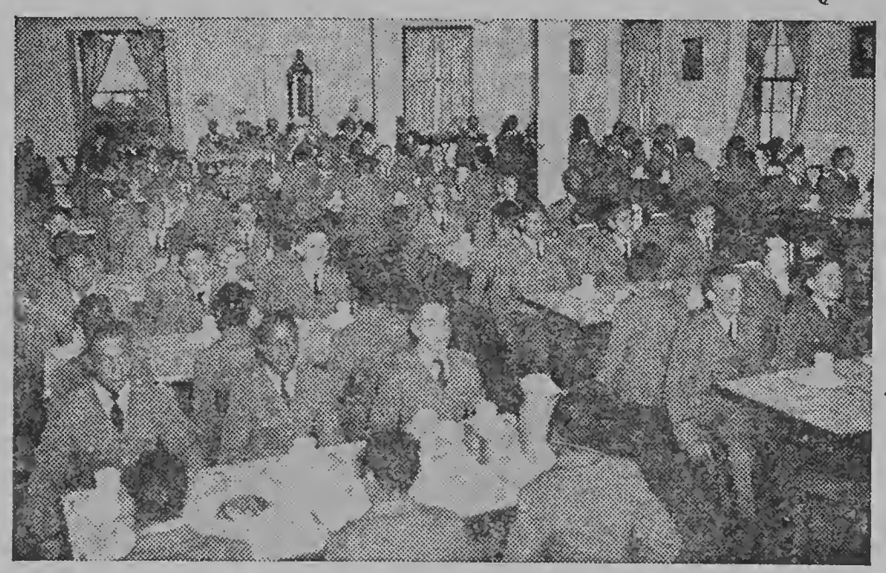
Donald Thomas, efficient and popular business, church and civic leader of Savannah writes to me "It is a source of genuine joy and satisfaction to be able to claim you as my personal friend. You are one of Georgia's greatest human assets."

Sydney Jones in a New Year's greeting says: "Savannah is extremely fortunate in having you as a citizen of our community. You are making an unusual contribution to the life of all the people." Jones succeeds because of his unusual fine personality and will to serve.

"My observation shows that wherever a Hubert has cast his lot, almost without exception, he has made a distinctive and unusual contribution."—Rev. W. C. Davis, pastor St. Phillip's monumental Church, Savannah.

The human family needs folks able to find something good in every one, and big enough to tell that individual and the world what they have discovered. Negroes have already succeeded when good manners—the ability and willingness to do and say something worthwhile for others—becomes a part of their philosophy or life.

Dining Hall at St. Emma



ROCK CASTLE, VIRGINIA. The full and busy day in the life of a cadet at the St. Emma Military Academy produces a large and husky appetite, and the dining hall is a most popular spot. Much of the good, wholesome food consumed is grown right on the farms of the school property as part of the courses of the boys in the agricu tural department. Plenty of milk is available from the model dairy, eggs and chicken from the poultry farm, meat from the beef cattle and swine sections, while truck gardening provides an unlimited supply of choice vegetables. Canning projects on fruit and vegetables give the boys training and provide food for the coming winter. The students at this boarding high school live in the dormitory nearby. Each cadet selects a course in trade or agriculture along with the military activities of the Junior Reserve Officers Training Course supervised by the U. S. Army. Military discipline is maintained by the cadets under their own officers. Students come from all parts of the United States.

FARM POPULATION MAY BE CUT IN HALF

The trend toward larger farms and fewer farm operators was emphasized strongly last week by Secretary of Agriculture Clinton P. Anderson in an address in Chicago, and similar emphasis was placed on this trend the week before by Arthur Raper, author of "Preface to Peasantry," and "Tenants of the Almighty," in an address at Tuskegee.

Speaking before the national convention of the American Farm Bureau Federation on December isn't too much to expect that before many years one man on the farm will be able to produce all the food and other farm products needed for ten in the cities."

It is pointed out that presently two men are needed on the farm to meet the agricultural needs of ten in the cities. Thus the Secretary believes that the farm population, which has shown a marked decrease in the last 40 years, may be reduced to half of its present size within a few years.

Dr. Raper, a social science researcher in the Department's Bureau of Agricultural Economics, told the farmers at Tuskegee's 55th Annual Farmers' Conference on December 12 that hand labor on cotton farms in the South compete with machine made machines.

He pointed out that mechanized cotton production would displace four out of every five of those now needed on one mule hand picked cotton farms. It is thought that this estimate indicates a reduction of Negro cotton farmers from the current level of over half a million to about 100,000 with, of course, a corresponding decrease in Negro farm population in the Cotton Belt.

In his address, Dr. Raper suggested the need for a stepped up educational program in the South to help better equip displaced farm people for the more highly specialized industrial jobs in the cities.

COTTON PRODUCTION DOWN

This year's cotton crop in the United States may total only 9,195,000 bales of 500 pounds each, according to the Crop Reporting Board. This would be 3,035,000 bales less than the 1944 crop, and 3,098,000 bales less than the 10-year (1934-43) average.

The lint yield per acre is down somewhat also. It is estimated at 249.6 pounds—43.9 pounds less than the 1944 record of 293.5, but 18.6 pounds, above the 10 year average.

It is pointed out that heavy abandonment of planting during the year reduced the cotton acreage to 17,688,000 acreas for harvest. This is the smallest since 1884. And despite the smaller acreage this year, about a fifth of the crop was still in the field on the first of December.

However, there is no shortage of cotton. Our carryover on August 1 was 11,040,000 bales while total world stocks reached a record high of 26.5 million bales, according to the U. S. Department of Agriculture's Office of Foreign Agricultural Relations.

NEW FSA HEAD

Dillard B. Lasseter of the War Manpower Commission has been appointed administrator of the Farm Security Administration to succeed Frank Hancock, who resigned a month ago to return to private business.

Mr. Lasseter comes to the Department of Agriculture with a background of wide experience in government service, having served with the National Youth Administration, the National Recovery Administration, the diplomatic service, and the War Manpower Commission. He left the position of regional director of Region 7 of the latter agency to accept the FSA post. Although Mr. Lasseter was appointed less than two weeks ago, he has already conferred with Reuben Simmons and Herbert Henegan, administrative assistants on his staff, to get a picture of the work being done with FSA's Negro borrowers.

FATHER AND SON WIN FARM AWARDS

Thirty years of planning, working, and carrying out modern farming practices were climaxed when Carroll Jones, a former sharecropper, who has climbed step by step into the ownership of 1,500 acres of land, was selected the most outstanding Alabama colored farmer of the year at Tuskegee's Annual Farmers' Conference on December 12.

It was a double triumph for this progressive farmer, because his son, too, a 19 year-old 4-H'er, received an award. The youth won the grand championship prize at the Tuskegee livestock show for his 810 purebred Hereford calf which won out in competition with 36 other animals.

Farmer Jones lives at Epps, a farming community in Sumter County, Alabama, near the Mississippi line. His parents were sharecroppers, and he was a c roppper and tenant for nearly 15 years. But back in 1913 he attended a farmers' conference at Tuskegee and saw Booker T. Washington honor a farmer who owned his land and who had grown an outstanding crop.

From that day on, Mrs. Jones worked and planned for the day when he, too, would be so honored by Tuskegee. So, he set about to own a farm and to be a first rate farmer Today he owns 1,500 acres and rents an additional 1,900 acres. There are 14 tenants on his farm; he keeps an average of 300 head of beef cattle—most of them purebred Herefords—in his improved permanent pastures; he has 75 head of work stock and over 100 head of hogs.

Last year he sold 130 bales of cotton 175 tons of hay, over 300 head of cattle and 76 hogs, netting for himself about $17,000. In recognition of this outstanding achievement, Dr. F. D. Patterson, second in line as President of Tuskegee from the famed Booker T. Washington, presented the Certificate of Merit. And so 30 years of working and planning toward a goal were climaxed.

When asked what accounted for his success as a cattle farmer, Mr. Jones replied, "Good bulls and improved permanent pastures."

Then he added, "I put 80 tons of phosphate on my pastures last year and 120 tons this year."

Also, Mr. Jones pointed out that his former county agent, C. C. Lanier, had played an important part in helping him to improve his herd, conserve his soil, and follow approved farming practices. Mr. Lanier has been appointed to the important post of State contact representative for the Field Service Branch of the Production and Marketing Administration.

With a broad smile, Mr. Jones said that both of his sons plan to remain on the farm and continue to build it up. "Willis, who won the grand championship prize at the livestock show yesterday, was one of three 4 H boys who won trips to the National Livestock Show in Chicago this year; he got some good pointers at the show," Mr. Jones declared, "now I believe he's sold on livestock for good."

LESS THAN 5,000 JAMAICANS NOW EMPLOYED ON FARMS HERE

The number of Jamaicans employed on farms in this country has been reduced from a peak of 22,000 to 4,444 the Office of Labor of the U. S. Department of Agriculture reports. The others have returned home, or are awaiting repatriation.

Jamaican farm workers remaining in this country are employed principally in Florida and Connecticut. Bahamian farm workers in this country number 3,900.

Farm workers generally showed a marked decline in December 1 reports which indicated that a million and a half fewer persons were employed on farms than a month earlier.

RESEARCH CHEAP COMPARED TO WAR COSTS

A recent issue of USDA, the Department's house organ, pointed out that even the cost of a huge agricultural research center such as the one at Beltsville, Md., is "peanuts" compared to the cost of prosecuting a war.

The Beltsville research center comprises 13,900 acres, 36 laboratory buildings, 31 greenhouses, and employs a staff of 2,200. And yet these buildings, facilities, equipment, and the land cost only $13,000,000, the amount required to finance our part of World War II for about an hour and a half.

Dusty bulbs and lamp shades waste electricity giving from 20 to 50 per cent less light.

Farming in Tanks of Water Hailed As Coming Industry

New York, Jan. 19—(Special)—Crops grown in tanks of water instead of from the usual acres of soil are no longer a scientist's prognostication but a distinct possibility in coming years, it was reported here today.

"Farming in water"—the science of hydroponics—is now a tried and successful method of producing abundant out-of-season crops and increasing crop yield according to an article, "Farming Without Soil," in the January issue of The American Mercury.

The article reports on the hydroponics program conducted by Major E. W. Elliott of the War Department's Supply Planning Division in combat areas. According to Major Elliott, soilless gardens, located in such places as the Philippines, in islands where the soil was not fertile or was disease-infected, filled war needs for fresh vegetables so completely that area commanders called for them much faster than they could be set up. He predicts that from the Army's successful experience with farming in tanks will rise one of the most important peacetime industries in America. He also believes that such war-starved countries as Greece could be quickly rehabilitated along the food lines by setting up soilless gardens.

Some of the advantages of this new method of producing food are:

(1) An ability to grow several times as many vegetables as on the same area of soil.

(2) The operator is not bothered with weeds or costly cultivating implements.

(3) The vegetables are bigger and better.

(4) Since plant food chemicals can be controlled on a precise basis, the food value of all tank garden products can be stepped up to their maximum possibilities.

(5) Out-of-season crops can be produced under glass.

Hydroponics, reports the article can produce an abundance of vegetables in the back yards or roof tops of congested cities with limited garden space.

The Money You Gave to The March of Dimes Is Spent Wisely to Help All

More than $850,000 has been spent at Tuskegee Institute, Alabama for treatment of Negro victims of infantile paralysis during the past five years, Basil O'Connor, president of the National Foundation for Infantile Paralysis, announced today.

The Tuskegee Institute Infantile Paralysis Center is the main hospital for treatment of Negro poliomyelitis patients and training of Negro physicians and nurses in the care of polio patients.

Since 1941, the National Foundation has granted $742,503.69 to the Tuskegee Center from funds collected in the annual March of Dimes. Local chapters of the National Foundation have presented a total of $120,000 to the center, in addition to paying for treatment of patients in their own communities.

More than 200 polio patients from communities in fourteen states have received treatment at the Tuskegee Infantile Paralysis Center. Four of these states lack proper facilities for the local care of their infantile paralysis victims.

The age range of these patients has been from one year to thirty-six years. They have come from Alabama, Florida, Georgia, Illinois, Kentucky, Louisiana, Maryland, Mississippi, New York, Ohio, Oklahoma, South Carolina, Tennessee and Virginia.

Facilities for after-care of infantile paralysis patients have been enlarged at Tuskegee through a grant of $132,000 from the National Foundation and $189,000 from the Federal Works Agency. This addition to the Tuskegee hospital was constructed and equipped at a cost of $350,000. Twenty-six more beds are now available for infantile paralysis patients, making the total bed capacity fifty-six.

To enable Tuskegee to improve its program for physicians and nurses, the National Foundation has made a five-year grant of $280,735 to the institution. Consultants and supervisors from the best training centers are standardizing the course in the School of Nursing. Tuskegee requires all students of nursing to learn the care of infantile paralysis patients and the National Foundation thus aids in the training of Negro nurses who will work in every section of the United States.

A new nurses home is under construction at Tuskegee to meet the pressing need for adequate housing of a hundred nurses and to provide proper classroom facilities for nursing education. For this purpose the National Foundation made a grant of $133,500.

Tuskegee provides for vocational rehabilitation of patients and education of child victims of the disease. The educational work at the center is a joint venture of Tuskegee Institute and the Alabama State Department of Education. Vocational rehabilitation of patients is achieved through cooperation of the institute and vocational rehabilitation departments and state commissions for crippled children in the patient's home states.

While undergoing treatment at Tuskegee, some polio patients have learned the three R's; and others have had additional training in trades such as linotyping and commercial photography. Dr. F. D. Patterson, Tuskegee Institute president, in commenting on the center as it is today said: "The Tuskegee Infantile Paralysis Center was not built with the idea of reaching all Negro patients, but to be a center for training doctors, nurses and physical therapists, and for studying unusual cases. It is taking some patients, and will take more. But the greatest good will come through the kind and cases successfully treated and the enriching experience afforded Negro doctors, among whom there are at present dangerously few orthopedie surgeons."

This polio center is housed in a modern, three-story fireproof building linked to Tuskegee's John A. Andrew Memorial Hospital by a one-story corridor. It cost $172,256 when constructed in 1941.

On the first floor of the building are the offices of the medical director and his administrative assistant, the plaster room where casts are made and applied, the recreation center in which child patients go to school, laboratories, nurses' lounge, and the brace shop where children's appliances are fitted after being made at Tuskegee institute.

At one end of the basement is a 20,000-gallon, temperature-controlled pool, part of the physical therapy facilities. Also in the basement are physical therapy treatment rooms, a gymnasium equipped with whirlpool and leg baths, electrotherapy machines, facilities for massage, a smaller room with exercise machines, and a Hubbard tank for the treatment of children too small to use the pool.

On the top floor, the patient floor, are six rooms with hospital beds. Walking patients and those in wheelchairs go out on the sun deck on fair days. Frequently, bed patients are moved to wheeled cots for sun baths on the deck.

Dr. John W. Chenault, medical director, has been head of the center for its inception. He is a graduate of the University of Minnesota and a former Rockefeller Fellow in orthopedic surgery at both the University of Chicago and the University of Iowa.

On Dr. Chenault's medical and administrative staff are an administrative assistant, a physical therapist and two assistants, a head nurse, seven other graduate nurses, and a worker in charge of the brace shop.

Infantile paralysis patients are referred to Tuskegee by chapters of the National Foundation for Infantile Paralysis. A few apply direct to the Tuskegee Institute Infantile Paralysis Center.

Funds for this polio treatment center at Tuskegee are secured through the March of Dimes, January 14-31, nation-wide appeal of the National Foundation. The 1946 March of Dimes is dedicated to the Memory of Franklin Delano Roosevelt, founder of the National Foundation for Infantile Paralysis.

DIMES AIDED ME!

Clifford Marshall, two-year-old polio victim from Bowling Green, Ky., has made progress in a year. With the aid of a brace, he now walks about nonchalantly and is beginning to enjoy his childhood. When he was first admitted to the Tuskegee Institute Infantile Paralysis Center, he could not stand on his own two legs, even with the aid of a physical therapist.

Clifford's care, his brace, muscular re-education and other treatment are provided for him at the center by the Kentucky State Chapter of the National Foundation for Infantile Paralysis, through contributions to the March of Dimes, January 14-31. Address your gift to the March of Dimes through your local chapter of the National Foundation and help provide aid for other polio sufferers, regardless of age, race, ereed or color.

In Peace As in War—Teamwork

During the war, among numerous other paradoxes, one was increasingly obvious: the war developed fraternity and friction side by side among comrades-in-arms. Under the fierce discipline of struggles men forgot everything except the need for success in battle; under relaxation from combat they indulged every irritation grievous and petty. The gripe of the soldier was as celebrated as his valor.

This paradox will carry over in a measure into the eivilian life of the years of recovery into which we move. Certainly the old areas of friction will be as frequently eneountered, but equally certain the new demands for vigilant and united courage will be pressed upon us.

This is inescapable, and our salvation lies in constantly reminding ourseves that in war, it was the teamwork that won, not the griping.

There will always be things in people that annoy. The impulse to fuss now and then is----we presume----accomodated by our laws that guarantee free speech, even if it is eomplaining. But annoyance does not create energy for action and progress. On the contrary our advance toward brotherhood is retarded every time we exploit our differences in a quarrel. If we believe in the growing need for fraternity among all the people of the world as the only real barrier against world chaos, then we must keep our minds and hearts sensitive to the major matters which can unite us indeed in a fellowship of spirit and action that will be a part, at least, of the challenge we offer to the forces of division that noisily predict our doom.

In Peace as in war—teamwork!

Over 30 Million Quarts Of Food Canned By Colored Farm Club Women

Washington, D. C.—Over 30 million quarts of food were canned last year by colored farm club women and 4-H girls, says a recent report on Extension work among Negroes in the South by John W. Mitchell, Extension Field Agent of the U. S. Department of Agriculture.

According to the report, colored farm women and 4-H'ers of North Carolina led the South in the average number of quarts of food canned per person. In that state, 25,000 club women and girls canned 4,534,000 quarts of fruit and vegetables or 180 quarts each. In Alabama, 31,000 club women and girls canned and otherwise preserved $2,505,700 worth of food. Arkansas club women canned 2,880,000 quarts of fruits and vegetables, Louisiana clubbers canned 2,000,000 quarts of food and Texans canned 3,300,000 quarts of food. These figures do not include conservation of food by non-members of women's home demonstration clubs and girls' 4-H clubs.

The report points out how the Extension Service farm and home demonstration agents stepped up their program, worked with more families, helping them to increase their wartime production of food for home consumption and for marketing.

In Oklahoma, for example, 4,300 families improved their diet last year, and 3,800 South Carolina club women sold $92,500 worth of poultry and eggs and $32,500 worth of milk. In one Tennessee county, the colored farmers produced $200,000 worth of food. In Mississippi, colored farmers sold $302,000 worth of milk, and $105,000 worth of poultry and eggs.

The report indicates a significant wartime shifting over partly from cotton and tobacco to food crops. These crops are said to have played an important part not only in improving the diet of Negro farmers, but also in providing year-round cash income.

Also included in the report is the enlarged list of Negro Extension workers numbering 784 (including the emergency workers) who have helped 671,586 colored farm families to step up their production of food. Mississippi leads the list with 134 permanent and emergency agents serving 159,000 colored farm families. Texas comes second with 113 agents for its 52,000 colored farmers, and North Carolina, third with 88 agents for its 57,000 colored farm families. The report places the 4-H enrollment at 277,563. This represents an increase of 50,000 over the 1943 enrollment.

Lincoln, Of Missouri, Students; Shown Rare Historical Exhibit

Jefferson City, Mo., Jan. 12, 1946—The Negro in American Life, an exhibit loaned by the Council Against Intolerance in America, will end a two week display at Lincoln University (Mo.) on Jan. 22. The display, planned and executed by John Pbecker, consists of 22 placards depicting various areas of Negro life.

Pictured are the Negro as a worker, writer and a hero: the American Negro spiritual featuring a book by that title, by James Weldon Johnson and his brother, J. Rosemond Johnson, with a photo of the former, and one of Mrs. George W. Meyer, who has taken the Fisk Jubilee Singers on a tour of the country.

Music is represented by W. C. Handy Billie Holiday, Ethel Waters and Duke Ellington. Art was portrayed (painting and architecture) both in the African and modern modes. Among the famous Negro educators and writers were Benjamin Banneker, Frederick Douglass, Booker T. Washington, E. Franklin Frazier, J. Saunders Reddick, Richard Wright; authors and poets, architects and artists included Roi Otley, reporter and author; Langston Hughes, poet and novelist; Margaret Walker, poet, famous for her "For My People;" William Edmondson was included as the sculptor who had a one-man show of modern art in 1937.

Marion Anderson, of whose voice Toscanini said, "A voice like hers comes once in a hundred years;" Paul Robeson, Katherine Dunham, and Lena Horne were those pictured as entertainers.

The field of sports showed Sgt. Joe Louis, Ralph Metcalf and Jesse Owens.

In tribute to the late George Washington Carver, world's famous scientist, an entire poster was dedicated to his works, also including him with the author of his biography, Rackham Holt; with the late President Franklin Delano Roosevelt, and a photo of his museum (The George Washington Carver Museum) at Tuskegee Institute.

Told in pictures was the part the Negro has played in the several wars: Peter Salem in the American Revolution; Sgt. Carney who, during the Civil War said, "With God's help I will bring back the colors with honor or else report to Him the reason why." Sgt. F. W. Pullen of the Spanish American War; Henry Johnson and Needham Roberts, first American privates to receive the Croix de Guerre of World War I; Dorie Miller, receiving the navy cross, and Cpl. John D. Hilton and Pfc. Ernest Walls, each received the soldiers medal gave proof of their contribution to the war efforts. In this classification was also Capt. Hugh Mulzack of the U. S. Booker T. Washington, his ship, as well as that of other victory ships, the U. S. Frederick Douglass and George Washington Carver.

This area would not have been complete without the photo of Brig. Gen. Benjamin O. Davis, and one of the "Defense Worker."

Other pictures showed Negroes in public life: Mary McLeod Bethune, W. E. B. DuBois, Dr. Chas. R. Drew, Hon. W. H. Hastie, Walter White and A. Philip Randolph; Public Servants in New York City; Dr. Jerome Peterson, Hon. Francis Rivers, Hon. Jane Bolin, Dr. Louis T. Wright, Hon. Hubbert T. DeLaney and Hon. William Andrews.

Of particular interest was the poster showing white and Negro children playing together declaring "Race prejudice isn't natural—children don't naturally have it. Children learn it from older people. Children naturally play happily together."

And its neighbor with Old Glory as the central attraction, there were the people of China, the Philippines, the East and West Indies, Africa, India and South America, who (like their brothers who total more than ¾ of the world's population— NON-WHITES) when we speak of the Four Freedoms "all these people look to our treatment of the American Negro to see what we really mean."

The purpose of this exhibit, therefore, was to get a true picture of what the American Negro contributes to the American way of life, to show what they are rather than what most people think they are; "to make you think—to get you to think straight; our straight thinking has a great deal to do with the welfare of our nation with our happiness and the happiness and lives of our children."

The exhibit is being displayed on the campus under the supervision of the Office of Public Relations.

WOMAN'S PAGE

SPICY APPLE SOUFFLE WITH LEMON TOPPING

2 tablespoons butter
1-3 cup flour
1 cup evaporated milk
1 cup water
1 cup coarsely grated tart apples
1½ teaspoons lemon juice
¼ teaspoon cinnamon
⅛ teaspoon nutmeg
½ teaspoon salt
½ cup sugar
3 egg yolks
3 egg whites

Melt butter in top of double boiler. Add flour, stirring well. Add milk and water to make a thickened white sauce. Add lemon juice, spices, salt and sugar to apples and mix well. Add apples to white sauce and remove from heat. Beat yolks until thick and lemon colored and add to white sauce. Fold in stiffly beaten egg whites. Place in ungreased baking dish in pan of hot water. Bake in moderate oven (350 degree F.) until firm and golden brown, about one hour. Serve immediately with fluffy lemon topping. Serves 8.

FLUFFY LEMON TOPPING

½ cup evaporated milk
1 tablespoon lemon juice
½ cup confectioner's sugar
½ teaspoon grated lemon rind

Fluffy lemon topping can be prepared just before souffle is done. Chill milk icy cold, then whip until stiff. Add lemon juice and whip just to blend. Fold in confectioner's sugar and lemon rind.

TANGERINE NUT MUFFINS

2 cups flour
2 teaspoons baking powder
1 3 cup sugar
¼ teaspoon salt
4 tablespoons shortening
1 egg
1 cup tangerine juice
½ cup chopped pecans

Sift flour; measure; add baking powder, sugar, salt and sift again. Using two knives or a pastry blender, cut in shortening until mixture resembles coarse corn meal. Beat egg well, add tangerine juice and mix; add to flour mixture and stir only until all the dry ingredients are moistened. Add chopped nuts and mix. Fill greased muffin pans 2 3 full and bake in 425 degree oven for 30 minutes. Serve hot with tangerine marmalade.

PLAIN CUP CAKES

½ cup shortening
¼ cup sugar
¾ cup corn syrup
1 teaspoon vanilla extract
1 egg
2 cups sifted flour
3 teaspoons baking powder
1 teaspoon salt
½ cup milk

Cream together shortening and sugar. Add corn syrup gradually. Beat well. Add vanilla extract. Add egg, beating until light and fluffy. Sift together flour, baking powder and salt. Add flour mixture to creamed mixture alternately with milk, beating well after each addition. Fill greased 2 inch muffin cups ½ full. Bake in moderate oven (375 degrees Fahrenheit) about 20 minutes. Yield: 2 dozen 2-inch cup eakes.

After using bath towels, spread them out on racks to dry instead of folding or bunching them. In hot weather soggy towels can mildew over night.

CHEESE TIDBITS

There are many ways in which cheese can be used to make up delicious little tidbits. Combine cheese with crisp oven popped rice cereal to make a spiey, tempting "something to nibble on" which the teen-agers will adore, or spread a cheese mixture on large bread cubes then toast briefly in the oven.

A WAFFLE PLATTER

Lazy morning breakfasts and informal evening lunches often call for crisp waffles. Serve them hot with pats of butter and plenty of sirup. Add two favorite waffle companions, broiled bacon and broiled peach halves to make the meal complete.

To prepare the peaches, place a bit of butter and brown sugar in the hollow of each half, and brown slowly under the broiler.

Lightest waffles result when the egg whites and yokes are beaten separately, and the whites are folded into the batter at the last.

WAFFLES

2½ cups sifted soft wheat flour
3 teaspoons baking powder
1 teaspoon salt
3 eggs, separated
1½ cups milk
6 tablespoons melted shortening

Sift flour, baking powder and salt together. Beat egg yolks and add milk. Add to flour mixture. Add melted shortening. Fold in stiffly beaten egg whites. Bake on hot waffle iron. Yield: 5 seven inch waffles.

BAKED BEANS SANDWICHES

(For all Except the Littlest)

Everybody likes cold baked beans sandwiches between brown bread with a generous dash of catsup of chili sauce to spice the eating. Quick sandwiches come from the bean pot. Make the day before, you'll have fast sandwich stuff for the morning.

HOME MADE BAKED BEANS

1 quart Navy Beans
1 large onion shredded
¼ lb. scored salt pork
2 3 cup karo
1 teaspoon prepared mustard
2 teaspoons salt

Soak beans in cold water overnight. Drain and cover with fresh cold water. Bring to boil and let boil 5 minutes. Drain and rinse with cold water to harden beans. Add onion, salt pork, karo, mustard and salt. Place in heavy casserole, cover and bake for 8 hours in moderate over (350 degrees F.). If necessary, add more water after 4 hours cooking time. Eight servings.

PUMPKIN MUFFINS

1 cup flour
3 teaspoons powder
½ teaspoon soda
¼ teaspoon cinnamon
1 cup corn meal
2 eggs
1 cup milk
½ cup cooked pumpkin
½ cup molasses
½ cup melted shortening

Mix and sift flour, baking powder, salt, soda and cinnamon. Add corn meal. Beat eggs. Add milk. Combine with dry ingredients. Add pumpkin, molasses and shortening. Mix well. Pour into greased muffin tins. Bake in hot oven (40 degrees F.) 25 minutes. Makes 12 large muffins.

SALMON PUFF WITH MUSTARD SAUCE

1 tall can salamon
3 cups bread cubes
1 cup cooked peas
2 tablespoons minced onion
1 teaspoon salt
¼ teaspoon pepper
½ teaspoon paprika
½ teaspoon dry mustard
2 eggs
1 cup thick white sauce

Flake salmon and combine with bread cubes, peas, onion, salt, pepper, paprika, and dry mustard. Beat eggs and add to white sauce. Fold into salmon mixture. Pour into greased loaf pan, 4½x8½ inches. Bake in moderate oven (350 degrees F.) about 45 minutes. Unmold and serve with Mustard Sauce or Chili Sauce. Yield: 5 servings.

MUSTARD SAUCE

2 tablespoons margarine or butter
2 tablespoons flour
1 teaspoon salt
⅛ teaspoon pepper
½ teaspoon dry mustard
1 cup milk

Melt margarine or butter. Mix flour, salt, pepper, and dry mustard and add gradually to melted fat, stirring constantly. Add milk gradually, stirring well. Cook until sauce thickens. Serve hot on Salmon Puff.

POTATO SOUP WITH OATMEAL

4 cups meat stock, or use bouillon cubes
2 cups diced potatoes
½ cup sliced onions
1 cup sliced carrots
½ cup chopped celery
½ cup rolled oats
⅛ to 1 cup cooked tomatoes
Salt and pepper

To meat stock add potatoes, onions, carrots, and celery. Bring to boiling point. Gradually stir in the rolled oats. Simmer 20 minutes or until vegetables are tender. Add the tomatoes. Season with salt and pepper and heat.

POTATO CRUST

Line a baking dish with mashed potatoes. Fill center with vegetable stew and left over bits of meat or fish. Cover with mashed potatoes. Bake in a hot over (400 degrees F.) until hot through and brown on top. If you have just a little potato make only an upper crust.

POTATO PUFF

To 3 cups mashed potatoes, add 1 egg yolk, hot milk to moisten, 2 tablespoons melted fat, salt, and any other seasoning you like. Beat well. Then fold in 1 stiffly beaten egg white. Pile lightly into a greased baking dish. Bake in a moderately hot oven (375 degrees F.) 30 minutes or until puffy and brown.

POTATO GRIDDLE SCONES

2 cups sifted flour
1 teaspoon salt
3 teaspoons baking powder
1 3 cup milk (about)
2 tablespoons fat
1 cup cold mashed potatoes
1 egg, beaten

Sift together flour, salt, and baking powder. Cut in fat with 2 knives or a pastry blender. Blend in the potatoes. Mix egg and milk; add to first mixture. Mix slightly. Roll ⅜ inch thick and cut into squares. Bake slowly on a hot greased griddle or frying pan. Turn several times to cook through. Makes 10 or 12.

For a main dish, pour creamed left over meat or fish or vegetables over the scones.

POTATO SCALLOP

6 medium sized potatoes
2 tablespoons flour
1½ teaspoons salt
2 tablespoons fat
Pepper
2 tablespoons fat
2 cups hot milk

Peel and slice the potatoes. Put a layer of potatoes in a greased baking dish. Sprinkle with part of flour, salt, and pepper. Dot with fat. Repeat until all the potatoes are used. Pour in the milk —use very fresh milk or it may curdle. Bake in a moderate oven (350 degrees F) for 1 hour or until the potatoes are tender and browned on the top. Add more milk if the potatoes get dry.

POTATO PANCAKES

Grate 2 cups raw potatoes and put immediately into ¼ cup milk. Add 1 egg, beaten slightly, 2 tablespoons flour, 1 teaspoon salt, pepper and 1 tablespoon finely chopped onion. Drop from a tablespoon onto a greased frying pan. Cook until well browned and crisp on both sides. Serve hot.

TO USE SUGAR SUBSTITUTES

Sweetness equal to one cup sugar:

Maple syrup, 1 cup
Honey, 1 cup
Sorghum, 1 cup
Molasses, 1½ cups
Cane syrup, 1½ cups
Corn syrup, 2 cups

PRUNE ORANGE BREAD

As the little red school house once again welcomes its many schoolgirls and schoolboys, mothers welcome recipes for lunch box foods.

Sandwiches, a favorite lunch box food, are especially popular with youngsters when made with Prune Orange Bread. This fruity quick bread with its refreshing flavor is a tasty pep tonic at noon lunch periods. Youngsters love its pleasing flavor combination of prunes, oranges, and nuts and will tuck extra slices of this quick bread into their lunch box for afternoon snacks. Thin slices of Prune Orange Bread may be spread with softened margarine or butter and made into plain "bread and butter" sandwiches. Other fillings such as peanut butter and marmalade, softened cream cheese, or apple butter make pleasing varieties. If desired, generous slices of Prune Orange Bread may be served as dinner dessert doubling for fruit cake, or topped with whipped cream cheese and served "plum pudding" fashion.

Prune Orange Bread has also its nutritional goodness. From the enriched flour with its added B vitamins and iron to the prunes and oranges used in making the bread, it is chockful of food value.

PRUNE ORANGE BREAD

½ cup shortening
1 cup sugar
2 eggs
¾ cup chopped cooked prunes
2½ cups sifted enriched flour
4 teaspoons baking powder
2 teaspoons salt
1 teaspoon cinnamon
1 cup ground whole orange, pulp and juice
¼ cup milk
¾ cup chopped nuts

Cream together shortening and sugar until light and fluffy. Add eggs. Beat well. Add prunes and mix thoroughly. Sift together flour, baking powder, salt, and cinnamon. To creamed mixture add flour mixture alternately with ground orange and milk. Mix thoroughly. Add nuts and mix well. Bake in greased loaf pan in in moderate oven (350 degrees F.) about 1½ hours.

Yield: 1 loaf, 4¾x8½ inches.

Fragrant enriched bread makes excellent foundation for an elegant sandwich. Not only does enriched bread lend itself to a wide variety of tasty sandwich fillings, but with its added B vitamins and iron it rates high among nutritious foods.

RASPBERRY ROLL UPS

A quickly and easily prepared accompaniment for a "spot of tea" is to be found in raspberry roll ups. Cut crusts from slices of fresh bread and spread with raspberry preserves. Roll up and fasten each end with toothpicks. Toast in slow oven (425 degrees) until light brown.

Singeing the hair may make the ends of the hair more brittle.

Grease stains on leather may be removed with benzine or turpentine.

TRY THESE HINTS AND SAVE SUGAR

Drizzle a little honey or cane syrup over your cereal—some like it better than sugar.

Cook cereals with prunes, raisins, or dates, and serve without sugar. Top cereal with fresh fruit—no extra sugar is needed.

Use canned fruit syrups for sweetening other foods.

Use jelly rolls, Boston cream cakes instead of frosted cakes.

Sheet cakes require only half as much frosting as layer cakes.

Serve sweet yeast breads, such as cinnamon rolls, and sweet quick breads occasionally instead of more sugar consuming cakes. Use honey, maple syrup, cane syrup, molasses or sorghum for glazed sweet potatoes, in baked or soft custards, sauces for ice cream and cornstarch or tapioca puddings.

Substitute syrups for sugar in many cake and cookie recipes.

SUGARLESS GINGERBREAD

½ cup melted shortening
1¼ cups molasses
1 egg, beaten
2½ cups sifted flour
1½ teaspoons soda
1 teaspoon cinnamon
1 teaspoon ginger
½ teaspoon cloves
½ teaspoon salt
¾ cup hot water

Combine shortening and molasses and add egg. Stir until well blended. Mix and sift dry ingredients and add alternately with the hot water. Bake in a well greased 9x9x2 pan in a moderate oven for 45 minutes.

PANCAKE SYRUP

Blend orange juice with honey as corn syrup to taste and use as a syrup for pancakes or waffles. A bit of grated orange peel adds pleasing fragrance and flavor.

BEEF CHOP SUEY

3 tablespoons lard
1½ pounds lean beef
1½ teaspoons salt
¼ teaspoon pepper
3 cups hot water
1½ cups onions, chopped
3 cups sliced celery
1 jar bean sprouts or mixed Chinese vegetables
3 tablespoons cornstarch
3 tablespoons cold water
2 teaspoons or more soy sauce
1½ teaspoons sugar
1 or 2 bouillon cubes

Purchase ¾ inch thick slices of meat if possible. Wipe meat with a damp cloth and cut into strips with kitchen shears. Sear in hot fat quickly without browning. Sprinkle with half the salt and 1 teaspoon of the soy sauce. Add water and simmer 40 minutes or until meat begins to be tender. Add onions and celery, 1 bouillon cube, and rest of soy sauce. Cook until vegetables are barely tender, about 20 minutes. Mix cornstarch, cold water and sugar, add to hot mixture and stir until thickened. Add bean sprouts, reheat, taste and add pepper, an extra bouillon cube and extra salt and soy sauce, if necessary. Just before serving add, if desired, a few whole toasted almonds. Serve chop suey over hot boiled rice and sprinkle with a few extra almonds.

SWEET POTATO PIE

2 tablespoons fat, melted
½ teaspoon salt
½ cup corn syrup
¼ cup orange juice
1 teaspoon grated orange rind
2 cups mashed sweet potatoes
1 or 2 eggs, separated
½ cup milk

Add fat, salt, syrup, orange juice and grated rind to the hot mashed sweet potatoes. Add beaten egg yolks and milk. Beat well. Fold in stiffly beaten egg whites. Pour mixture into a ten inch baked pie shell and bake in a moderate oven 30 or 40 minutes.

Put sweet potatoes in the oven or kettle without peeling and you will save vitamins.

THE MODERN FARMER

VOL. XIX. NASHVILLE, TENN., MARCH 15, 1946 No. 2.

The Road Up

These Are The Vanguards

By

GILES A. HUBERT

Bill Street sent me a copy of the Souvenir program of the first annual meeting of the "paid-out" Negro farm owners of Georgia who bought their farms under FSA. There were twenty of them, twenty out of 858 Negro borrowers in Georgia who have made loans since the program started in 1938.

Now these farmers had up to forty years to finish paying for their farms. Many others are far ahead of schedule on their payments. Add to these 858 new farm owners, 342 more who have been aided by FSA to obtain purchase loans from banks, insurance companies and other sources and that makes 1200 new Negro farm owners in the state of Georgia.

These twenty "graduated" farm owners started out with a net worth of $1,110 before they enrolled in the FSA program. Now they have an average net worth of $7,616. Any way you figure it, this is fast stepping. These farmers are operating the type of farms which can compete and hold their own against all comers in the Southern agriculture of the future.

If we take the entire 858 borrowers, some of whom only joined the program a year ago, the record is good. At the end of the 1944 season the average amount due to be paid by these farmers was $146.-15 (think of it—buying a good farm at $146.00 a year), but the average amount paid was actually $227.61. On January 1, 1944 their average net worth was $1,724.00. A year later on the same date in 1945 their average net worth was $2,223.00.

Now this is **progress.** This is **dramatic,** this is **important.** In these days of agricultural mechanization and scientific progress, in these days of changing systems of farming, it becomes more and more difficult for the Negro farmer to compete. Usually his little farm is too small, too poor and too inadequately equipped.

He has the poorest schools with the poorest teachers. He is excluded from the principal local organizations which direct economic and political activities. He is without the ballot. How is the Negro farmer going to keep up with the changes and participate in the progress of an economy which is becoming more competitive?

The truth is that many Negro farmers will fall by the wayside—will be forced out of competition. The number who will be able to survive will depend upon such help as is provided by the Farm Security Administration. This program means for the farmer adequate land resources, adequate capital and the advice and guidance which allows him to compete in an advancing economy.

These 20 FSA farmers have proved the success of this method. These 858 farmers are plowing the

Anderson Pays High Tribute To Dr. Carver

National Farm Labor Union Announces Campaign Against Ceiling on Farm Wages

H. L. Mitchell, President of the National Farm Labor Union in Memphis, Tenn., announced today that the organization was beginning a campaign against the plans of the U. S. Department of Agriculture to impose a ceiling on wages of low paid cotton choppers in the South.

L. I. Jones, chairman of the USDA Wage Board in Mississippi announced that a referendum among cotton growers would be held on April 2. to determine whether or not the Government shall set a ceiling on wages of cotton choppers at $2.00 or $2.50 per day. These wage rates were recommended by cotton planters at two hearings held by the board with the majority favoring $2.00 per day with no limitation of the number of hours to be worked.

Meanwhile, the Delta District Council (composed of locals in Arkansas and Missisippi delta counties) of the National Farm Labor Union were engaged in distributing 10,000 handbills urging all cotton producers in Mississippi to vote against the ceiling. The handbill (copy attached) calls upon growers to vote the Department of Agriculture bureaucrats out of your business."

Mitchell said, "if the referendum is approved, the National Farm Labor Union will challenge the legality of the wage ceilings in the fed

Gibson Farmers To Use Flames In Cultivating Cotton

HUMBOLDT, Tenn., March 16.—(Special)—In order to keep Gibson County abreast of the most modern methods of farming, three of the county's leading farmers will initiate flame cultivation of cotton in West Tennessee this year.

The three farmers who will chop their cotton with flames are Neil Laymon, Frank Allen and Langton Watt of the Brazil and Gibson Wells Communities.

The new method, which takes the place of hoeing, will eliminate weeds and grass without damaging the cotton stalk.

PRESENTS USDA JOB REPORT

Aware that further reduction in force may be made in the U. S. Department of Agriculture, Dr. Ernest M. Norris, left, special assistant to USDA Personnel Director T. Roy Reid, presents Mr. Reid a summary report showing the relative employment position of colored workers in the Department during the last six years. The report points out that although colored employees number 2,119—an increase of 85.2 percent over the 1939 employment figure—they constitute only 3.3 percent of total Department personnel.

Davis Appointed To Important Post In U. S. Department Of Agriculture

Washington, D. C., February 11, 1946—Appointment of James P. Davis, former colored field representative of the Agricultural Adjustment Agency, to the post of an administrative officer of the Field Service Branch of the U. S. Department of Agriculture was announced last week by Southern Regional Director C. D. Walker.

Mr. Davis, who was with the AAA from 1935 to 1945, will have as his first assignment the important job of assisting colored farm leaders in acquainting colored farmers with the protection offered their cotton crop through Federal Crop Insurance. After the close of the crop insurance sales campaign, he will assist colored leaders in acquainting colored farm and non farm people with the need for, provisions, and objectives of the agri

Speaks At Dinner Honoring Guest Scientist

Washington, D C.—Secretary of Agriculture Clinton P. Anderson was the principal speaker at a dinner honoring the memory of Dr. George Washington Carver at the Penn-Harris hotel in Harrisburg, Penn., last week.

The dinner which was arranged by Clyde Zehner, Pennsylvania State director of the Production and Marketing Administration of the U. S. Department of Agriculture, was held in connection with a conference for adjusting Pennsylvania's 1946 agricultural production goals.

In his address, Secretary Anderson pointed to the work of Dr. Carver as a pattern for agriculture. Said the Secetary, "In this, the year our President has called 'a year of decision,' I believe that we can well follow the example of George Washington Carver in recognizing the relationship between actions in agriculture and other parts of our economy, and in planning and acting boldly to plunge across new frontiers of scientific and economic achievement."

High tribute was paid Dr. Carver by the Secretary in his opening remarks. Said he, "I feel that this occasion, honoring the memory of a beloved and brilliant agricultural scientist is particularly appropriate during these times. While I never had the good fortune to know Dr. Carver personally, I know the record of his unselfish, far sighted service."

Continuing, Secretary Anderson added, "Despite fabulous offers from industry, this humble man preferred to give his service in the South where he felt it was most needed, explaining that 'Whatever helps the Southern farmer helps the entire South, and whatever helps the South helps the world. He was a true pioneer in science. He did much to leave a better place

Colored Employment In USDA Nearly Doubled Since 1939

Washington, D. C.
February 4, 1946

Dr. Ernest M. Norris, special assistant to the personnel director of the U. S. Departmen of Agriculture, has prepared a summer report showing that Negro employment in the Department has nearly doubled since 1939. However, the report also shows that, in spite of the increase, colored workers comprise only 3.3 percent of the Department's total personnel.

The report prepared for USDA Personnel Director T. Roy Reid, places total full time employees of the Department—in Washington and the field—at 65,202 as of September 30, 1945. Of these 2,119 are colored. A breakdown of the job classification of the colored employees shows that nearly 55 percent are in professional, subprofessional, clerical, administrative and fiscal categories, as compared with only 17.8 percent in these classifications in 1939.

Also, the report shows that there has been a continual increase in the number of colored employees. In 1939 there were only 1,114 colored workers in the Department, in 1945 there were 2,119 (not including 593 colored Cooperative Extension agents and 376 emergency war food production aides.) This represents an increase of 85.2 percent over the 1939 figure. In the Washington office, employment of colored workers increased from 263 in 1939 to 808 in 1945, an increase of 203.4 percent.

However, Dr. Norris points out in his report that only 25 percent of the colored workers are in the highest retention group. This indicates to some extent how further cutbacks may affect the colored

Farmers Union Asks Better Farm Homes —page 5

St. Emma Cadet Band

ROCK CASTLE, VIRGINIA. The St. Emma Cadet Band holds a most important place in the military and social life at the St. Emma Military Academy. It is a regulation 28 instrument Army band, and is a part of the Junior Reserve Officers Training Corps which the U. S. Army supervises at St. Emma. Music is supplied for all cadet drills and ceremonies, and in addition the band takes part in many entertainments throughout the school year. All band members follow the regular academic course at this boarding high school, as well as a subject in trade or agriculture. Shown in the photograph, grouped according to the instrument they are playing, left to right, are: Clarinet section, front row, S/Sgt. Edgar Redmond, age 17, drum-major (Dist. of Col.); Cadet Phillip Holland, age 15 (Alabama); Cadet Harvey N. Williams, age 15 (Virginia), and Pfc. Christopher Lindsay, age 15 (South Carolina). Back row, Cadet Donald Ware, age 15 (Ohio); Cadet Elwood Jones, age 15 (Pennsylvania), and Cadet William Jordan, age 15 (Virginia). Saxophones, Cadet George Thomas, age 17 (Rhode Island); Sgt. Theodore Adams, age 16 (New Jersey), and S/Sgt. Edwin Jenkins, age 16 (Alabama). Trombones, Cpl. Francis Jones, age 15 (Virginia), and Capt. Wilbur Clarke, age 17 (New York), Commander of the band. Baritone, Cadet Harvey H. Honore, age 14 (Louisiana). Basses, 1st Lt. Ferdinand Wilson, age 17 (Maryland), and Cadet John A. Reynolds, Jr., age 15 (Michigan). Percussion, Cadet Wm. Randolph, age 16 (Virginia); Cadet Raymond Holton, age 15 (Mass.); Cadet Carlos Simmonds, age 17 (Maryland), and Cadet Francis Campbell, age 15 (District of Col.). Alto Horns, Cadet William A. Freeman, age 16 (Maryland), and Cadet Leo Bradshaw, age 14 (North Carolina). Trumpets, front row, 1st Sgt. Plater Campbell, age 17 (District of Col.), and Bugler Sgt. Clifford Stewart, age 16 (Alabama). Back row, Cadet Robert Buck, age 15 (Alabama), and Cadet Coleridge T. Franklin, age 16 (Alabama). Standing at the right rear is the Conductor, Fr. Constantine, O.S.B., a member of the faculty and Dean of the school.

LANE COLLEGE FARMERS CONFERENCE HIGHLY SUC CESSFUL

Jackson, Tennessee: Dr. T. R. M. Howard Superintendent, Taborian Hospital, Mound Bayou, Miss., delivered the principal address Friday at the mass meeting closing the 42nd annual session of the Lane College Farmers' Conference. In his eloquent and stimulating address, Dr. Howard discussed the problems of the farmer in the Mound Bayou area and drew parallels to the situation in West Tennessee. He described the successful cooperative efforts of the farmer in his area. He challenged for leaders and teachers to adopt a realistic approach to the problems of the farmers.

While Dr. Howard is an outstanding physician and surgeon he was invited to the conference as a farmer. His stock farm features the most outstanding breeders of hogs in America, some of his hogs having been purchased by the Mexican government last year for use in its stock improvement program. His farm also includes 1000 pedigreed white rock hens and a $25,000 herd of pure bred Aberdeen-Argus cattle. His successful leadership both in health and in farming lead the Saturday Evening Post to publish a feature article about him in a recent edition.

Other features of the two day conference included a discussion by the champion farmer in the tri-state area. Last year, competing against 15,000 farmers in the states of Arkansas, Mississippi and Tennessee, Burge Clemons, near Covington in Tipton County, was selected as the farmer making the greatest progress in the "Live at Home" contest sponsored by the Memphis Commercial Appeal. During the discussion of their methods, Mr. and Mrs. Clemons stated that a hail storm destroyed their cotton crop in early October but their program of crop diversification kept their income up to the prize winning level.

Another guest of the conference was John L. Yarbrough, also of Tipton County, winner of the 4-H Club contest with his champion 270 pound pig which was auctioned off at two dollars per pound.

Other speakers on the program were Prof. U. E. McKinnon, Phillips School of Theology, "How Can the Rural church Become More Useful to the Farmer;" G. S. Rivers, Supervisor, Farm Security administration, "Farm Finance and Records;" Ben P. Hazelwood, Superintendent, West Tennessee, Experiment Station, "What's New in Agriculture;" Miss Elizabeth Keller, University of Tennessee Extension Service, Knoxville, "Family Living." There were demonstrations on "Improved Kitchens", by Miss Bessie L. Walton, Assistant State Home Demonstration Agent, "Poultry Calling;" W. N. Williamson, Assistant State Agent, and "Care and Pruning of Fruit Trees;" A. M. Dobbins, County Agent.

The rural women furnished dinner on Thursday and the women of Jackson on Friday. Attendance at this years conference were not as large as in some previous years because a week of warm, sunny weather permitted farmers to pick cotton. This unusual phenomenon is the result of early bad weather last fall which caused about half of the West Tennessee cotton crop to be left in the fields all winter. Teachers reported attendance off seventy and ninety percent because of this good cotton weather.

The conference announced prizes for farmers in the counties surrounding Jackson who make the greatest improvement in the quality of their poultry, hogs and cattle during 1946.

NEGRO FARM COUNCIL HOLD ANNUAL MEETING

All Officers Unanimously Reelected

Raleigh, N. C.—Bartell Lane was reelected president of the Negro Farmers County Council of Wake County, N. C., at its first meeting for the year, which also was featured by a study of community needs and workable plans for the County.

Other officers reelected were R. B. Raiford, vice-president; R. D. Wilder, secretary; and I. C. Hayes, treasurer.

Reports were heard on the progress of the Extension program affecting Wake County and its communities. Following the reports and a discussion by the group, a 15 point program was adopted for bettering farming in Wake County and of making greater contributions in the post war effort.

The program calls for: wise use of credit; community leadership; food and feed production for family needs; food and food storage; livestock and poultry production (care and management); soil conservation; team and equipment purpurchase; community co-ops; neighberhood action groups; farm ownership (under sound credit and supervision); proper fertilizers for proper crops; burning of mortgages market outlet for surplus truck crops; assistant for returning veterans in getting located on farms; and medical and hospital care for community farm families.

The Blue Cross Plan for Hospital and Surgical Care for farm families was outlined by Mrs. Jessie Q. Mills of the Hospital Saving Association.

The council meeting was conducted by W. C. Davenport, Negro County Agent of the State College Extension Service.

DEATH TO BEDBUGS

DDT is a "perfect" answer to the bedbug problem, the U. S. Department of Agriculture says in a recent statement positively recommending DDT for this purpose. If the insecticide is applied properly as a 5 per cent spray to mattresses, beds, and chicken houses, these places will remain free of bedbugs for six months or more. To make a 5 per cent solution, seven ounces of technical grade DDT is dissolved in one gallon of kerosene. This is sprayed into each joint of the bed and on both sides of the mattress. After a few hours of drying the bed may be made up and used without fear of injury to the occupant. DDT powder can be used. This should be a 10 per cent dust. It is applied in the same locations as recommended for the spray.

DDT is not the answer to all "big" problems, experimenters are learning. Know what you want to eliminate before depending on DDT to get rid of it. Check with your county agent.

Migratory Labor Meeting Held In Baltimore

The Migratory Labor and Regional Farm Labor Conference. Labor Branch, FMA Extension was held at Lord Baltimore Hotel, Baltimore, Maryland, February 5, 6, 7, 8. Gathered at the meeting were federal officials, area directors and supervisors from all of the states bordering the Atlantic Seaboard. The only race man participating in the proceedings of the conference was Mr. F. Marcellus Staley who is serving in the role as regional farm labor assistant for the Southeastern area. He spoke on the subject, "What Migrants Want." His address received many favorable responses.

The program in general centered around Adjusting the 1945 Migratory Labor Program to 1946 conditions, 1946 Farm Labor Supply and Demand Outlook, The Foreign Program in 1946, Long-Time Farm Labor Program, Tentative Allocation of Foreign Workers to the States, Future Emphasis on Labor Utilization Administrative Problems in 1946 and Information Techniques and Appeals in 1946.

COLORED EMPLOYMENT IN USDA NEARLY DOUBLED

(Continued From Page 1)

employees.

To help ensure against any racial discrimination in the separation of persons from the Department, Personnel Director Reid has brought some of the facts revealed in Dr. Norris' report to the attention of the personnel officers of the 29 administrative units of the Department. Also, Secretary Clinon P. Anderson has issued a memorandum on fair employment practices, pointing out the policy which the Department has established for employment of persons regardless of race or creed.

Dr. Norris' report gives a unit by unit comparison in the percentage the Department has esablished for employment of persons regardless of Negro employees. The Office of the Secretary and the Research Center at Beltsville, Md., top the list with 28.8 percent. The Bureau of Human Nutrition and Home Economics comes second with 19 per cent, and the Library, third, with 15.7 percent.

The other 25 units each shows less than eight percent colored employees. Their percentages range from 7.1 down to 0.8 for 21 of the units; four show no colored employees. However the number of employees in the latter four units comprise only about one percent of the Department's personnel.

Dr. Norris points out that one of the most encouraging signs in the Department's employment of colored workers is the improvement shown in classification status. His report shows that while colored clerical, administrative and fiscal employees total only 863, they represent 40.7 percent of the total number of colored workers in the Department. For all Department employees, the percentage in this category is 39.2—slightly less than the figure for colored employees.

FISH FARMING

Plenty of fish on the table will be the rule with at least 151 farm families in South Sebastian County, Ark., as a result of a farm pond stocking program arranged through the co-operation of the Extension Service, University of Arkansas, and the U. S. Fish and Wildlife Service. J. Cole Westbrook, county agent, arranged for 166,100 bluegills and 15,000 large-mouth black bass for stocking 151 ponds. Farmers ordered fish through the Extension Service and Fish and Wildlife Service delivered them by truck to a central point.

Of the 151 ponds, 123 were fertilized in 1945 and all will be fertilized this year. Fertilizing increases the carrying capacity of a pond the same as fertilizing a pasture increases its capacity.

Stocked ponds serve a dual purpose—fish for the farm family and water supply for the farm stock.

NATIONAL FARM LABOR

(Continued From Page 1)

eral courts. We know that if it goes over in Mississippi, every other cotton producing area in the South and West will follow."

The Farm Labor leader also said that as a last resort the Union will call on all cotton choppers to refuse to work for the miserable wage the Department of Agriculture seeks to impose on the lowest paid workers in all America.

Mitchell also revealed that he had received assurance of support in the fight against wage ceilings from President William Green of the American Federation of Labor, President James G. Patton of the National Farmers Union, and the National Association for the Advancement of Colored People. He said he also expected the CIO to use its influence against the wage ceilings on farm labor.

Mitchell said President William Green wrote him, "I will gladly join with you in opposing any reduction in wages paid to low paid cotton workers employed by planters in Mississippi or any other state. The cutting of wages of these employed by cotton planters is well nigh criminal, particularly at this time when all agree the wage of all workers should be increased. I will join with you in the efforts you are putting forth to protect the wages of employees of cotton planters in Mississippi and elewhere."

The National Farm Labor Union, formerly known as the Southern Tenant Farmers Union, is an independent union but maintains a working relationship with both A. F. of L. and C. I. O.

DR. BRALLIAR SAYS:

Trees Pay Rich Dividends In Beauty, Comfort, Money

By DR. FLOYD BRALLIAR

Garden Editor

Trees add much to the value of property. They add beauty and comfort too. This being true, it is only wisdom to make every attempt to preserve our trees. We should feed them, prune them if needed and give them any other necessary care that will insure their longevity and well-being.

Untransplanted trees send roots both deep and wide and so usually get most of the minerals they need, but this is not always true of transplanted trees, especially if they are not small when set out. For trees that have been transplanted use a complete balanced plant food. Trees may be fertilized at any time during the year, but early spring is the best time to feed them.

How Much Fertilizer?

How can we determine how much fertilizer to use? If we use commercial fertilizer, allow one pound to each inch of circumference of the trunk, measuring the trunk four feet above the ground.

Since the main feeding roots of the tree extend out in a circle equivalent to the circle made by the drip of the branches, this is the proper place to apply the plant food. Make a series of holes, two inches in diameter and about 18 inches deep under the drip of the branches, in a zigzag fashion.

Use Pointed Device

The holes can be made best with a ground augur but a crowbar or other pointed device can be satisfactorily used. Fill the holes with a mixture of half plant food and half soil. Then water.

Often merely sowing nitrate of soda evenly over the surface of the soil under the tree at the rate of one pound for each two inches of the diameter of the tree is all that is needed. Water well after sowing.

LIBERALIZED REA POLICY TO AID COLORED FARMERS

Washington, D. C., February 11, 1946—Officials of the U. S. Department of Agriculture say that colored farmers living on the back roads and in sparsely settled areas stand to benefit by recent Congressional action liberalizing the terms under which the Rural Electrification Administration may make loans for the electrification of farms and rural homes.

In his annual report to the Secretary, REA administrator Claude R. Wickard emphasized that Congressional action reducing the interest rate on loans to two percent extending the repayment period from 25 to 35 years will enable REA borrowers more nearly to make electricity available to all potential users in their territories.

Among such potential users are said to be thousands of small farmers on back roads, in isolated areas, and in sparsely settled regions. It it pointed out that many colored farmers live off on the back roads and in somewhat isolated areas of the South because they often find it difficult to buy or rent land more favorably situated.

Within the next three years electricity may be brought to a good many of these farmers through REA's stepped up program. Mr. Wickard reports that shortly after VE Day, 926 REA borrowers were ready with line-building plans designed to bring electric service to 1,329,000 farms and rural homes by the end of 1948.

Of the farms and rural homes to be electrified during the three year period, 774,000, or 56 percent are in the South, where incidently 98 percent of all colored farmers live. Based on need the farmers in Texas and Georgia will be the largest recipients in the Southern States. The program proposes to bring electricity to 157,200 rural consumers in Texas and 89.50 in Ga.

This rapid expansion of rural electrification is in line with a five year program proposed by the Department's Interbureau Committee on Postwar programs. The five year program envisions electric service for 3,566,000 rural consumers now without electricity. Mr. Wickard says that since REA was started in 1935, it has brought eelctric service to 1,287,347 rural consumers.

GEORGIA AGRICULTURAL EXTENSION SERVICE ACTIVITIES

By A. S. Bacon,
Assistant Supervisor—Negro Work

The enthusiasm of Negro County Agents in the state has been greatly increased after the Annual Agents' Conference recently held at the Georgia State College, the state office at Industrial College, Georgia reports. It was stated by some of the agents that the meeting was one of the best ever held, the office disclosed. Many of the agents, according to the reports, have already begun to help neighborhood groups incorporate many of the ideas obtained from the conference into the individual county and community plans. Some of the points that are being stressed are: Producing sufficient food and feed crops necessary to maintain the people and livestock in the county; producing a wider variety of cash crops to increase the family farm income and conserving our natural resources. The agents have rendered assistance to farmers in developing and caring for home orchards. Dougherty county agent reports that two demonstrations were conducted in spraying orchards for disease with an attendance of sixty persons. Mitchell county agent reports that seven demonstrations were conducted in vegetables and truck garden production. Attempts are being made to increase the family cash income by adding additional crops and livestock. Baldwin county agent reports that several farmers are increasing their farm poultry flocks, as a source of increasing farm income. One farmer has put in 300 baby chicks which he plans to grow out to layers. Sumter county agent reports that efforts are being made to get farmers to plant pepper for the canning plant located at Americus. Calhoun county agent reports efforts are being made to improve livestock production, and that one pure-bred Duroc Jersey boar has been purchased already in one community. Cooperative marketing is being stressed by some agents. Terrel county agent reports that fifteen farmers sold livestock together.

Agents throughout the state are busy encouraging and helping farmers save their soil through good soil conservation practices. Bibb county agent reports that assistance was rendered to the county soil conservation technician in the winter of 1944-45 in gathering thirty pounds of kudzu seed. These seed were sent to a state nursery, and a reports from the nursery recently states that 50,000 kudzu crowns will be sent to Bibb county farmers. A group of 4-H boys helped gather the seed.

Agents throughout the state are trying to help farmers plan for greater and more efficient production on their farms. Every available opportunity to help alleviate the acute labor shortage is being taken. The agent in Jenkins county reports that this problem is being solved, to some extent by the use of farm machinery. Two farmers, one a World War II Veteran, and a former 4-H Club boy, have purchased two tractors with cultivating equipment, a combine and a jeep to help with their farming operations.

Improving the family living condition is kept as one of the outstanding activities in the Agent's mind and program of work. Camden county agent reports that aid was given in the past month in helping construct a community church and a dwelling house.

WAKE COUNTY FARMERS AND 4-H'ers SCORE HIGH IN CORN GROWING CONTEST
W. D. PEGRAM AND R. L. PENIX TOP WINNERS

Raleigh, N. C.

Wake County farmers and 4-H club members closed the year in the Corn Growing Contest with high production yields. W. D Pegram won top honors in the adult race while Robert L. Penix won top honors in the 4-H club. The county corn growing contest got underway at the beginning of the crop year with 138 contestants in the running. The high producers on one acre demonstration plots are:

Adult:

1st prize, W. D. Pegram, Providence Community, 92.3 bushels; 2nd prize, J. E. Perry, Eagle Rock Community, 91.4 bushels; 3rd prize B. W. Lane, Springfield Community. 79.8 bushels.

4-H Club:

1st prize, Robert L. Penix, Juniper Level Community, 89 6 bushels; 2nd prize, Theron Perry, Eagle Rock Community, 86.1 bushels; 3rd prize, Lonnie L. Wilder, McCullers Community, 79.4 bushels.

Prizes for the top producers are being sponsored by Negro business institutions of Raleigh. The purpose of the contest is to promote, encourage, influence, and increase the yield of corn in Wake-County. The contest is conducted by W. C. Davenport, Negro County Agent of the State College Extension Service, Raleigh.

Ebenezer Missionary Baptist Church To Be Host To 1946 Sunday School Congress

Summer School of Methods Will Convene on the South Side of the Great Windy City—Denomination Please Note Change

Dr. J. H. L. Smith, Pastor Chosen Chairman of General Committee; Dr. J. M. Foster, President of the Baptist Ministers' Alliance, Remains As Co-Chairman

Chicago, Ill.—(Spl.)— By action of the Illinois leaders, association moderators and the officers of the Baptist Ministers' Alliance of Chicago and Vicinity, taken in this city last week, the Sunday School Congress has been moved from the West Side and will be held here on the famous South Side in the great Ebenezer Baptist church, located at 4501 Vincennes Avenue. Other changes by the committee and the leaders were to the effect that the Rev. J. H. L. Smith, D. D., the new entertaining pastor of the Congress, is chairman of the General Committee on Entertainment, and that the Rev. J. M. Foster, D. D., president of the Baptist Ministers' Alliance of Chicago and Vicinity and moderator of the Friendship Baptist Association, remains as co chairman.

The officers of the Housing Committee are Mrs. C. T. Mason, 4501 Vincennes Ave., chairman: with Mrs. Emma Glover as co-chairman. These two will assign all messengers who send in their requests for assignment. It is understood that the former chairman of the Housing Committee will turn over to the new chairman all the requirements for assignments.

The selecting of Ebenezer Bapt. church was brought about by the fact that Greater Union Baptist church felt that under present conditions which they are facing, they would not be financially able to decorate their building, make certain improvements and be ready to serve as host in an acceptable manner, to this large group of Baptists who will be here from every State in the Union, since the pastor had resigned and this leaves them without a shepherd, a spiritual adviser and a local church leader.

Another action taken of the executive session was that Morning Star Baptist church, 3993 S. Park way, Rev. I. M. Hendon, D. D., pastor, will be host to the Executive Committee of the National Baptist Convention of America and the Woman's Auxiliary. This will give these two extra arms of the Convention ample meeting places and housing facilities to accommodate them during June 5 9. The next was that the Brotherhood Union of the National Baptist Convention of America, which will have a department in the Sunday School Congress, will be entertained by the Forty fourth Street Baptist church at 735 E. 44th St., Rev. E. Thurston, D. D., entertaining pastor.

The announcement was made further that this general committee and the executives of the State, County and City would hold another special meeting in the Ebenezer Baptist church on the morning of April 2nd. Official notification that the Ebenezer Baptist church will entertain the task of being host has already been sent to the National Baptist Publishing Board, signed by Dr. J. H. L. Smith, pastor and chairman of the general committee, and by Mr. L. E. Cage, secretary of the committee, with Mrs. C. T. Mason, chairman of the Housing Committee. This action not only guarantees the Congress session, but is an assurance of improved facilities in every way, due to the fact that the South Side, this great metropolitan center and cosmopolitan municipality has more organized churches, with larger church auditoriums and a resident population of around three hundred and fifty thousand, the larger percent of them being Baptists, and many of them having come up here from the South, Southeast and East, making Chicago in reality one of the greatest Baptist centers in the United States.

Your Babies Paradise Blackie The Lamb

The black lamb on his farm is proud
And holds his head above the crowd
He has a right to be elated
For let it here and now be stated
That on his back black wool grows
For our comfort and warmth and mending clothes.

Make Junior happy with Blackie The Lamb. Here is how you add this delightful little home-made top to Junior's collection.

Use Steel crochet Hook No. 4.

One yard of red ribbon.
One small bell.
2 beads for eyes.
Some cotton batting.

How to gauge your stitch: 6 stitches make 1 inch; 6 rows make 1 inch. Use a double thread throughout.

Make Blackie and win a ring-side seat to the Joe Louis-Billy Conn heavyweight fight.

For complete instructions on details of contest write the Woman's editor of your local paper.

Henry Allen Boyd Honored By The Treasury Dept. of the United States

Secretary National Baptist Publishing Board and President Citizens Savings Bank Awarded Silver Medal for Meritorious Service in War Activities

In recognition of his outstanding work in war finance and in the sale of United States Bonds and War Stamps, the Treasury Department of the U. S., Savings Bond Division has just awarded Rev. Henry A. Boyd, secretary of the National Baptist Publishing Board and president of the Citizens Savings Bank & Trust Company, a silver medal beautifully designed on both sides On one side there is a picture of the United States soldiers raising the American Flag over Iwo Jima which was one of the bloodiest battles in this world war No. 2. and on the other side the familiar figure of an American citizen leaving his plough standing in the field grasping his musket and going directly to the front. It was that figure that was used on practically all war posters, on literature sent, out in the interest of the Bond Sales.

The award came last week. There is inscribled on the medal, which is the size of an American dollar, and which itself is silver. "Awarded to Dr. Henry Allen Boyd." This, the Rev. Mr. Boyd stated, was not considered as for him alone, but he declared that entire denomination represented through the National Baptist Convention of America, the Sunday School Congress, the National Baptist Union Review, the Nashville Globe and Independent and the Modern Farmer should share in this honor, as he represented all of them in the various efforts that he helped to put over while we were at grips with our enemies in the great war for the establishment and maintenance of the Four Freedoms.

The letter containing this medal was signed by Dr. Wm. Pickens of the Inter racial Section. United States War Bond Division, and was dated in Washingon, D. C., March 20th. Dr. Pickens said:

"Dear Dr. Boyd:—We are especially happy to send you this registered letter with the enclosure. The enclosure is a silver medal on which the Treasury Document has complimented you by engraving your name before sending it to you. This is done in recognition of the great patriotic and volunteer service which you have rendered to your country through the Treasury Department and its War Finance Division during the years of the war.

Personally, I am very happy to have been associated with you in that good work and I am sending you also my personal thanks for all of the cooperation which you have given us.

As you know, the Treasury now has a peace time savings organization, known as the U. S. Savings Bonds Division. I hope that our colored people will continue to take advantage of the opportunity to save by continuing the purchase of bands and stamps.

Don't neglect the back of your rug. At the time when you give the surface a thorough cleaning, turn the rug over and vacuum or brush the underside.

THESE ARE THE VANGUARDS

(Continued From Page 1)

straight furrow toward competitive success in the State of Georgia.

We are informed that in all some 252 Negro FSA borrowers have paid for their farms in full and more than 6,000 are purchasing farms under the program.

THESE ARE THE VANGUARD. They are only too few. Would that the same land, capital and guidance could be going to 100 times this number. Only then could we have assurance that Negro farm families would be taking a firm place as farm enterprizers in Southern agriculture of the future. Herein lies our hope.

SPEAKS AT DINNER

(Continued From Page 1)

than he found it, and throughout his long, industrious life he refused to believe that the frontiers of new knowledge were ever closed to anyone."

The Secretary told the dinner guests that we can do justice to ourselves and the world in which we live, only if we keep in mind George Washington Carver's unselfish ideal of interdependence and his recognition that the limits of new knowledge are never reached.

Declared the Secretary, "We must push ahead on all fronts, with research, credit, marketing, transportation, housing, and better family living.--------- We need to move ahead even faster in such great fields as rural electrification farm housing and farm family living."

Prior to the dinner meeting honoring Dr. Carver, Mrs. Ethel Cordell, a colored farmwoman of McKean County, Pennsylvania, who is helping to sponsor a school program in her community, gave a demonstration on school lunches. She not only explained to the state agricultural officials the importance of the lunches but also served them a school lunch to prove her point.

Polly: I'm going to write a novel.
Molly: Do you know how to write?
Polly: Don't have to, I'm going to use a typewriter!

The Suffrage Fight And Negro History Week

By Katherine Shryver, Executive Secretary, National Committee to Abolish the Poll Tax

Negro History Week properly serves to remind us of the role that Negroes have played in our national history. Negro history is American history. But somebody with a pruning knife has constantly cut out of the written record the Negroes' contribution.

Pruning was often, of course, not enough. The vine had to be gouged, the blossom ripped off, or the stem stripped away. And strange fruit was bound to come of such a mistreated vine.

Negro History Week is an attempt to graft back onto the vine the chunk of root, the bud, the stem. We who have been raised under the twisted growth want a flourishing, a whole plant. We want the record complete.

Especiany we want to record the history of the fight against the poll tax, which for seven years has been headed up by the National Committee to Abolish the Poll Tax. This organization was founded at a historic interracial meeting in Birmingham, Alabama, in 1938. The thousand Negro and white Southerners who braved "tradition" and cops' clubs included Dr. Mary McLeod Bethune (now a vice-chairman of the anti-poll tax committee), Dr. Charles Johnson of Fisk University, Dr. Ira deA. Reid of Atlanta University, Dr. Frederick D. Patterson of Tuskegee, Dr. Rufus Clement of Atlanta University, and John P. Davis of the National Negro Congress.

A civil liberties committee set up at this meeting took a look at the many futile attempts to repeal the state laws, and decided to turn to their Federal Congress for relief from an intolerable burden. Thus was born the National Committee to Abolish the Poll Tax, to back Congressman Geyer's first anti-poll tax bill.

In a long fight during which the anti-poll tax bill has three times passed the House of Representatives and three times been declared constitutional by the Senate Judiciary Committee, Negroes have without let-up served on the executive board of the Committee, planning strategy; or educated their organizations to the need for political action; or served on delegations to senators and political leaders; or issued statements to move the battle along at one point or another. Rev. W. H. Jernagin of the Fraternal Council of Negro Churches, Dr. J. Finley Wilson of the Elks, both Charles Houstons, Dr. Channing Tobias, Walter White, Robert R. Church, A. Philip Randolph, as individual and as union leader, Judge William Hastie, Thomasina Johnson, Congressman William Dawson and A. Clayton Powell, Max Yergan, have made history as Negro and white labored to defeat the fascist base in America—the poll tax system. Paul Robeson, in song and spoken word, has fought the poll tax. Negro church leaders have lent their good offices.

These are the leaders. But hundreds of thousands of Negroes through their organizations have made their pressure felt. The Southern Negroes have asked their Northern brothers to bring political pressure, but Southern Negroes have not hesitated to support this fundamental fight, sending in dimes and dollars, signing petitions at personal risk, working with their white friends to highlight the anti-South record of "their" congressmen.

The struggle has not been successful—yet. But today, thanks to the filibuster and the long educational process, the people of America know the poll taxers as a threat to their liberties. Also the vote has taken on new importance and dignity among a population that had almost forgotten the right.

And some Negro History Week in the near future will record the successful fight for a free ballot for all Americans.

EDITORIAL

The Secretary of Agriculture in his annual report has stated that diversification of the South's economy would lessen the migration of colored people to industrial centers of the North. The Secretary did not give a good exposition as to just why it is desirable to lessen the migration of colored people to northern industrial centers.

Now, there is nothing objectionable to migration of surplus farm people to urban areas as long as jobs are available in the urban centers. It is only when jobs are not available or when any particular group of people are discriminated against in employment that the situation becomes serious.

Full and expanding operation of our industrial plant is necessary in order to absorb surplus, rural population, Non-discrimination in employment is necessary in order to provide equal opportunities for employment on the part of all groups in the population.

The Secretary is right when he says that expanding industry in the South would help absorb the South's surplus rural population in non-agricultural occupations. But it is in the South where discriminatory policies in industry are often most acute. The textile industry (the South's most important) has persistently discriminated against Negroes in its employment almost to the exclusion of them. It is the South that has fought most vehemently the work and very existence of the Fair Employment Practice Committee.

Of course, one can say that if the whites are given employment, more of them can provide jobs for Negroes as domestic servants. But this still maintains a large poorly paid group of workers ready to move north for better employment at the drop of the bat.

The point which is made here is that whether jobs are made available to workers North or South is not important so far as the Negro job seeker is concerned. It is whether or not he is going to get a fair chance at the jobs which are or may become available that IS important. Right now, and in the near future the prospect is that he will get a better chance at available jobs in the North.

If the South ever makes up its mind to give Negroes an equal break in industrial and commercial employment, it WOULD relieve the pressure on the large industrial centers of the North. Until this is done, there is not much real hope in this direction.

Possibly the most hopeful prospect is the impending organizational drive of the CIO in the South. If the CIO carries out its affirmed policy of non-discrimination in union membership and job allocations, economic diversification in the South may mean much to the South's surplus Negro agricultural population.

POLL SHOWS MOST FARMERS BACK NATIONAL FU POSITIONS

A recent Department of Agriculture poll shows the extent to which farmer opinion concurs with the program of the National Farmers Union.

The sampling revealed:

Four out of five farmers recognize that farm income is directly related to the level of employment.

Farmers think that the government should provide jobs in case of widespread unemployment.

Farmers everywhere favor better rural medical and health facilities.

Four out of five farmers want an increase in public clinics in rural areas.

Three out of four urge flat-rate payment plans to cover doctors' and nurses' services and hospital charges.

Four out of five want hot lunches served at school.

Two out of three would maintain wartime equipment-repair shops in schools.

Half the farmers want community canneries for convenience of farm families.

Two out of three favor expansion of rural library services.

Three out of five want price controls continued in the post-war period.

Eight out of 10 want the government to help veterans returning to farming or getting started in farming with suggestions ranging from low-cost credit to outright grants of land.

DAVIS APPOINTED TO IMPORTANT POST IN U. S. DEPARTMENT OF AGRICULTURE

(Continued From Page 1)

cultural conservation and other programs administered by the Field Service Branch.

Director Walker says that Mr. Davis will have his headquarters in Little Rock, Arkansas, and will travel throughout the nine States forming the Southern Region during the next three months, informing colored rural groups how they may insure their cotton crop.

Crop insurance is a relatively new Government program. It was in 1939—shortly after the disastrous drouths of 1934 and 1936—that a program of federal insurance was passed by the Congress to help protect farmers against ruinous crop losses due to unavoidable hazards. Wheat was the first crop to be covered; in 1942 cotton was added to the list. Last year the program covered wheat, cotton and flax; corn and tobacco were covered on a trial basis in a few selected counties. Experimental coverage of these two latter crops is continued this year in a few counties.

Because winter wheat was not insurable in 1945, cotton growers were the largest group of farmers to insure their crop last year. Of the 200,000 farms covered by crop insurance, 113,00 were cotton farms. It is expected that with the spread of information regarding crop insurance, and with time for crop insurance representatives to confer with farm people, a still larger number of cotton farmers will protect their crops with insurance this year.

Mr. Davis, who is aready on the job, says that he expects thousands of colored farmers—tenants and sharecroppers as well as owners—to insure their cotton this year against losses caused by such unavoidable hazards as droughts, flood excessive rain, storm, plant diseases, and insects—especially the boll weevil.

In order to reach as many famers as possible with the facts about crop insurance during the sales campaign, Mr. Davis plans to work very closely with colored ministers, vocational agriculture teachers, Extension Service farm and home agents, and other groups.

The importance of crop insurance as a protection against crop losses is emphasized by J. Carl Wright, Manager of the Federal Crop Inurance Corporation, who points out that cotton farmers under the program last year received indemnity payments totaling more than 10 million dollars for crop losses due to droughts, excessive moisture and boll weevil, floods and other causes.

Mr. Wright says that the premium rate for cotton insurance is very small. Of course, the rates are not the same in all places because the risks are different.

Mr. Wright adds that premiums may be paid at the time the insurance is taken out, or at harvesting time. The rate is the same in either case, and no interest is involved if the premium is paid within two months after the premium note is due. It is pointed out that farmers may insure up to 75 percent of their average annual yield.

Application for cotton insurance must be made by farmers before they plant or before the closing date for submitting applications in their county. Mr. Wright points out that any cotton farmer—tenant or sharecropper—can insure his interest in the crop whether the landlord insures his part or not.

State by state deadline dates for taking out insurance on cotton are as follows: for Texas it varies from February 15 to April 25; Louisiana and Florida, March 25; Arkansas, April 25, for Mississippi the deadline varies from March 25 to April 10; the same is true for Alabama, Georgia and South Carolina. States farther north have deadlines varying from April 10 to April 25.

West-South Freight Aid Is Enjoined

The South and West's relief from differential freight rates—a 10 per cent reduction in class freight rates—has been set aside by a special eastern federal court.

Instead of appealing, the Interstate Commerce Commission has, with almost unbecoming speed, agreed to the court's order.

The original ICC freight rate order reduced class freight rates in the South and West 10 per cent and increased them 10 per cent in the "preferred" eastern area in order to make rates more nearly equal throughout the United States.

Eastern states, led by Governor Thomas E. Dewey of New York, appealed to the court. The court, composed of three Eastern federal judges and presided over by District Judge Knox of N. Y., ordered the new rates indefinitely set aside. They contended it would cause many industries to leave the "preferred" eastern area and go to the South and West. The Eastern judges decided this was not desirable.

The Interstate Commerce Commission promptly acquiesced in the order.

An appeal against discriminatory freight rates is going direct to the Supreme Court from the state of Georgia. However, it is an original suit brought by that state and not connected with this proceeding.

Farmers Union Asks Better Farm Homes

WASHINGTON. — Alone among farm organizations, NFU this week endorsed the Wagner-Ellender-Taft housing bill, and both the National Grange and American Farm Bureau Fedcration specifically opposed the rural housing sections of the bill which would offer farmers the first real housing program they have ever had.

As a result, the Grange and Farm Bureau have seriously endangered a housing program for agriculture that, over a decade, could well run into hundreds of millions of dollars, not only bringing decent living conditions to the farm but providing many thousands of new jobs in rural areas and creating buying power that would benefit townspeople in farming areas.

(Large commercial farm operators are not interested in more homes in rural America, and the Farm Bloc organizations are apparently "going along" with them again.)

It is probably that the bill will pass the Senate pretty much in its present form, bringing its benefits to urban centers—except for Title VIII, the section providing for farm housing. As a result of the opposition of the two farm groups, there is grave danger the bill will be passed with no provision whatever for rural areas.

NFU Backs It

NFU endorsed the bill as a whole, strongly recommending, however, that the rural housing section be further strengthened by inclusion of a farm-enlargement loan program.

"Section 802 of the bill," NFU told the committee, through Legislative Secretary Russell Smith, "providing for 40-year loans at 3 per cent interest, permitting variable annual payments is perhaps the wisest and most far-reaching farm housing provision yet put forward in Congress.

"As has been pointed out repeatedly to the committee, the collateral for a farm housing loan is the income from the farm itself. If a farm housing program is to be of considerable proportions, then it must tackle the problem of farms that are too small to return an income adequate to permit the farmer to amortize a loan sufficiently large to give him a decent home. Like most other problems of farm operators, then, the inadequacy of farm units is a governing factor.

What Is Needed

"We believe emphatically therefore that the committee should provide in this section authorization for the Department of Agriculture to make 40-year 3 per cent loans, for the purchase of land to enlarge farm units now too small, and that such a program should be administered by a single agency.

"It is also our conviction that a land acquisition program for the purchase of large absentee-or corporation-owned farms, to be subdivided into family units, also ought to be undertaken by the government. Such a program is far preferable to attempting to meet the farm and rural housing problem through a large-scale construction program based in a general agricultural production and population pattern that is likely to shift greatly in the next decade. Instead of seeking, for example, to enable a landlord to construct homes for the number of tenants now on his land—a number which may be greatly reduced in the next few years—it would appear sensible to provide a program for acquisition of large units now owned, for example, by insurance companies, to sub-divide those into family farms, to establish as many tenants as possible on such farms, and along with that establishment to provide good housing for them."

Other NFU recommendations were for enactment of the provision for low-cost subsidized housing for those unable to share the 40-year credit program. This subsidized housing program would reach owners not eligible for full loans, sharecroppers and tenants. It would be operated, like urban housing programs, through local housing agencies, presumably on a county-wide basis.

It is lack of such provisions that account mainly for the fact that roughly $80 has been spent in cities for every $1 in rural areas for providing decent housing.

Concluding suggestions of NFU were:

"Such a provision as this should be administered in close co-operation with county farmer committees of the kind the National Farmers Union has advocated as part of a new national farm program. It has long been our conviction that such county committees should be set up in every agricultural county, to act as policy, advisory and appellate bodies in the operation of national farm programs, and that such committees should be complemented by a single representative at the national programs so that responsibility may be centralized at the grassroots. If such a structure now existed we believe the Section 808 administrative responsibility should lie in the Department.

"Title VIII now contains no specific provision for the encouragement of the addition of modern facilities to existing farm homes. We believe that the committee may wish to work out a Home Facilities Loan Program for installation of running water, of indoor toilets, of modern stoves, of the innumerable other facilities now lacking in rural homes. Such a section should of course be closely related to the present Section 808 loans to public agencies."

Secretary of Agriculture Suggests Farm Work Be Made More Attractive

WASHINGTON, D. C.—As an inducement to get returning veterans and war workers to take farm jobs Secretary of Agriculture Clinton P. Anderson suggests that farmers provide adequate housing and shorten the work-week. The suggestions were made in the Secretary's annual report which was released recently.

"The present allowance of $20 a week available under the Servicemen's Readjustment Act is somewhat higher than the average cash farm wage paid hired farm workers in March, 1945," says the report.

Continuing, the Secretary's report adds that in the South, where farm wages are lower than elsewhere, the readjustment allowances of returnees may exert an upward pressure on farm wages.

The report states that adequate housing and other items furnished free to the worker by the farmer may provide a considerable inducement for returning soldiers and workers to take farm jobs. It is thought that many farmers may find it useful to offer a stipulated work-week of reasonable length.

The report points out that, although the supply of labor for good farm jobs should be greater by midsummer than in any year since 1942, such inducements will help to offset partially the much lower level of farm wages as compared with industrial wages and at the same time attract more able-bodied young men.

In discussing the prospects of seasonal labor, the Secretary's report says that large growers may have more difficulty obtaining workers this year because prisoners of war, importees, and patriotic groups of local people are likely to be less available.

As for migrant workers, the report points out that living and working conditions of migratory laborers are not such as to attract many recruits unless there is prolonged unemployment.

However, the Secretary's report indicates that enough people will probably be available for farm work if they can be routed to the right place at the right time with assurance of employment and good pay.

Taking the long-time view, Secretary Anderson says that under full employment, agricultural production per worker will be enhanced by new and improved farm machinery, thus eventually less labor will be required. The Secretary adds that then it will be necessary to have more nonfarm jobs to absorb the displaced farm workers.

Dwindling Farming Opportunities Show Need For More Off-Farm Jobs

WASHINGTON, D. C.—Dwindling farming opportunities caused by technological progress calls for a land policy that will help surplus farm workers and their families find other employment, says Agricultural Economist John M. Brewster, writing in the winter number of the U. S. Department of Agriculture's Land Policy Review.

It is pointed out that such a policy is urgently needed in the South where mechanized cotton production threatens to displace thousands of white and colored cotton farmers.

Brewster reviews the relationship between land policy and population growth showing that until 1920, bringing new land into production meant morc farming opportunities as a means of providing food and fiber for a population that was growing faster than the farmer's ability to produce.

He points out, however, that between 1920 and 1940 technological progress overtook population growth. During that period, while the population increased 25 percent, farm technological advance stepped up production 35 percent; and did it with nearly two and a half million fewer farm workers.

The economist concludes that new land no longer means more farming opportunities. New soil resources based on wider use of fertilizer and lime, new varieties of crops, pest control, crop rotation and other improved practices aided by mechanization is making it possible for fewer and fewer farmers to produce more and more food and fiber. This can only mean, Brewster indicates, that year by year, more farm people must seek off farm employment. It is pointed out that colored farmers may be seriously affected, because they comprise 35 percent of the South's tenants and sharecroppers.

Brewster believes that a land policy is needed which would closely coordinate bringing new productive land into farms with ways of helping excess farm workers and their families to shift into other occupations. It is thought that while the shifting may cause some hardship, in the long run, it would prove beneficial.

Dr. Mordecai Ezekiel of the Department's Bureau of Agricultural Economics says that there is a direct relationship between the percentage of workers engaged in off-farm employment and the average per capita income.

He points out, for example, that in 1940 only 41 percent of Mississippi's workers were employed in off-farm jobs and the per capita income of that State's population was barely $205. While in Louisiana where 66 percent of the workers were outside agriculture, the per capita income was $365; and in Florida where 80 percent of the workers held off-farm jobs, the per capita income was $472.

Dr. Ezekiel estimates that if one-third of the number of persons working on farms in the South before the war could find off-farm jobs during the next 10 years, annual farm income in the South would increase from the pre-war level of $550 per farm family to $2,000. This is based on increased mechanization, larger cotton acreages by a smaller number of specialized cotton growers, larger scale of food from farms that would shift from cotton to food and feed crops, better farming methods, and greater industrialization to absorb the surplus farm workers.

On the Agricultural Front

BISHOP PRAISES CROP INSURANCE

Bishop John H. Clayborn of the African Methodist Episcopal Church told the Bishops' Council of his church at their annual meeting recently in Little Rock, Ark., that crop insurance is an important additional tool which will help protect cotton farms in the South against losses caused by unavoidable hazards.

The bishop pointed out that the U. S. Department of Agriculture makes it possible now for cotton farmers to insure up to 75 percent of their average annual yield.

"This is going to bring a new day to the South," Bishop Clayborn said. "Cotton farmers no longer stand helpless as rain, floods, drought, and boil weevils destroy their crops."

COLORED 4 H'ERS MAKING PEACETIME CONTRIBUTION

Colored 4 H Club boys and girls who made such an outstanding contribution to wartime production also are making an important peacetime contribution, according to reports received by the U. S. Department of Agriculture.

In Georgia, for example 34,000 colored 4 H'ers are planning to increase their production of pork, beef and vegetables. Already, some of the clubbers in that State have helped to meet this year's onion shortagc. One 4-H'er of that State sold as many as 11,000 onion plants during January.

Arkansas' 30,000 colored club boys and girls plan to take part in several State-wide contests from hybrid corn to home and community improvements. One group of clubbers in the State plans to enter their freshly painted junior high school in a contest. The youngesters mixed the paint and did the whole paint job themselves.

North Carolina's 28,000 colored 4 H'ers are keen on increasing their poultry production. Last year they produced slightly over 200,000 head of chickens; this year they are shooting for 250,000, and they plan to grow most of their feed.

Texas' 20,000 clubbers are planning to increase their acreage allotted to market gardens along with their pig projects.

USDA PROGRAMS AID COTTON FARMERS

Several programs of the U. S. Department of Agriculture may prove helpful to white and colored cotton farmers who are harried by troublesome surpluses which threaten prices.

One of the most important developments to aid cotton farmers has been the timely decision to export cotton to Japan. Under this program, Commodity Credit Corporation stocks of cotton will be shipped to a Japanese governmental agency designated and supervised by the Supreme Commander of Allied Powers in Japan. Enough of the textiles manufactured will be accepted to reimburse the United States in full for the cotton shipped to Japan.

It is estimated that the textile industry in Japan can use up to 1,400,000 bales of cotton during the next 12 months.

Another Department effort in behalf of cotton farmers has been a plea by Secretary Anderson for increased production of cotton textiles here to permit American cotton to compete for the large existing markets.

Research is continuing at a rapid pace in an attempt, moreover, to develop new uses for cotton and to expand the present uses.

To help assure greater use of cotton in the manufacture of automobile tires. the Department's Southern Regional Research Laboratory in New Orleans has carried out extensive tests with cotton cords. The laboratory has shown that better automobile tires can be made from cotton by using selected varieties of cotton and used in rear wheel positions gave 300 percent more mileage than tires made from regular commercial cotton. Passenger tires (6.00 16) made from standard and improved cord ran nearly 70,000 miles at 60 miles an hour on highway tests with one recapping, and the carcass was still in good condition.

In a directly allied effort, the Department is now promoting the use of lint cotton in the production of automobile batts used as filling material for seat cushions, backs, and doors. Manufacturers have indicated that they will use large quantities of low quality lint cotton if it can be obtained at prices competitive with other materials.

To help promote the production of better varieties of cotton, the National Cotton Council has prepared a set of ads on the 7-step cotton program which will be sent to advertisers, advertising agencies, and newspapers.

This is in line with one-variety cotton production. The nations 300,000 one variety cotton growers are making an extra return of $8 an acre a year on their more than seven million acres of one-variety cotton, or a total annual gain of 56 million dollars. If this sum was equally divided among the 300,000 farmers, each would receive $186.67, or enough to buy a good cook stove and a mechanical refrigerator.

NEGRO FARMER DOUBLES INCOME BY CONSERVING HIS SOIL

Joe Anderson, who lives near Marshall, Texas, in the Harrison County Soil Conservation District, has more than doubled his farm income by taking better care of his land, Soil Conservation Service reports in its March issue.

The U. S. Department of Agriculture publication points out that Mr. Anderson made only a bale and a half of cotton on six acres in 1941. But a year later he made three and a half bales of cotton on six acres. Crop rotation was partly responsible for the additional yield. Farmer Anderson's rotation now consists of cotton and corn interplanted with cowpeas in combination with hairy vetch.

In addition to building up his soil by the use of legumes, Mr. Anderson protects his farm against erosion by terracing. Within the last five years he has built nearly four miles of terraces on 56 cultivated acres of his 122-acre farm.

And because his soil conservation program provides for adequate pastures, Mr. Anderson has been able to increase his herd of cattle from nine to eighteen head. He plans further to enlarge his pasture and double the size of his present herd.

Twenty-eight acres of Mr. Anderson's farm are in woodland. He is saving this as an extra source of income later on when the trees are larger and will bring larger returns. Even then he doesn't plan to sell all of his trees. In line with approved practices, he plans to harvest them under selective cutting methods.

Most of Mr. Anderson's income from his farm is clear, because he grows almost all of his food at home. He has a small orchard, a good garden, chickens, hogs and cows. By growing his own food he helped to make more of the commercially produced foods available to his two fighting sons during the war, and, now that peace has come, his home grown food enables the United States to ship more food to the hungry peoples abroad.

HOME GARDENS CAN HELP AMERICANS SHARE MORE

During the war white and colored rural and urban homemakers made a substantial contribution to increased food production by growing gardens, the U. S. Department of Agriculture reports.

It is pointed out that by continuing to grow gardens the American people can substitute products from their gardens for "shippable" foods which can go to starving peoples abroad.

During the war the colored farmers of Alabama had a slogan for it. They'd say, "We are keeping our hands off the soldiers' table."

By growing part of their food in their home gardens, the American people as a whole can keep their hands off the almost bare tables of the hungry peoples in Europe, Asia, and Africa.

Tennessee Extension Workers Hold Annual Meeting

The annual meeting of Tennessee Extension workers was held at Tennessee A. and I. State College on January 21st and 22nd under direction of Mr. W. H. Williamson, State Agent, Miss Bessie Walton, assisted in presiding over the meeting. Mr. John W. Mitchell, Field Agent.; Mr Cornelius King and officials of the State Extension Service were prominent on the program. The outline of the program follows below:

Monday, Jan. 21 (Joint Session)
Mr. W. H. Williamson, Presiding
9:30-10:00, Devotional and singing.
10:00-11:00, Programs and Extension Policies for 1946, Director C. E. Brehm.
11:00-11:30, Readjustment of Extension to Peacetime Farm and Home Problems, J. W. Mitchell, U. S. Field Agent.
11:30-1:00, Noon.
Miss Bessie Walton, Presiding
1:00-1:30, How the State Pepartment of Agriculture Can Aid the Negro Farmer, Hon. O. E. Van Cleave, Commissioner of Agriculture.
1:30-2:00, County Program of work, J. H. McLeod, Vice-Director.
2:00-2:30, Home Improvement, Miss Lillian Keller, Clothing and Home Management Specialist.
2:30-3:30, How to Plan a County Extension Program (Panel Discussion), R. W. Moore, Asst. Director, leader.
J. R. Branham, Montgomery County.
Mrs. Alice Cottrell, Tipton County.
Miss Emma Person, Hardiman County.
A. M. Dobbins, Madison County.
Miss Kate Gresham, Davidson County.
3:30-4:00, Opportunities in Visual Education, A. J. Sims, Associate Editor and Chief, College of Information.
4:00-4:30, What Can the Extension Service Do to Improve the Health of the Youth of Our State? Miss Mildred Kemmer, Nutrition Specialist.
Tuesday, Jan. 22 (Joint Session)
Mr. W. H. Williamson, Presiding
9:00-10:00, 4-H and Older Youth Program (Panel Discussion) G. L. Herrington, 4-H Club Specialist, Leader.
E. R. Shockley, Hardeman County.
Miss Georgia Pillow, Giles County.
R. H. Brown, Shelby County.
Miss Margaret Harlan, Montgomery County.
10:00-11:00, How to Secure the Cooperation of Parents for a Better 4-H Club Program, Miss Bessie Walton, Leader.
Miss Minnie Harris, District IV.
J. K. Davis, Shelby County.
Miss Madgerine Henry, Fayette County.
F. E. Jeffries, Haywood County.
E. L. Burnett, Carroll County.
11:11:30, Looking Ahead in Poultry, W. O. Sewell, Asst. Poultry Specialist.
11:30-1:00, Noon.
Miss Bessie Walton, Presiding
1:00-1:45, Using Extension and Neighborhood Leaders in Developing Community and County Program of Work (General Discussion), G. C. Wright, Special Agent, Leader
1:45-2:45, Outstanding Projects in 1945.
C. D. Haley, Tipton County.
Miss LaVerne Epps, Williamson County.
G. A. Newbern, Maury County.
Miss Maggie Moore, Haywood County.
G. W. Senter, Davidson County.
H. W. Carter, Wilson County.
2:45-3:30, Rural Electrification Improving Standard of Living, M. Landiss, Tennessee Valley Authority (Illustrated Lecture)
3:30-4:30, How We Can Improve County Fairs, Short Courses and Achievement Days (Panel Discussion) W. H. Williamson, Leader.
Miss Anna Jackson, Madison County.
McAdams Sloan, Fayette County.
Miss Mary Woods, District III.
Wednesday, Jan. 23, 1946
9:00-9:30, Our Contribution to National Health, Dr. H. H. Walker, Instructor, Meharry Medical College.
(Women's Separate Session)
Miss Bessie Walton, Presiding
9:40-10:20, Home Economic Problems of the Farm Family Following the War," Miss Jessie Harris, Director, School of Home Economics, University of Tennessee.
10:20-11:00, Handicrafts in the Development of the Home and People, Miss Isadora Williams, Asst. Home Marketing Specialist.
11:00-11:25, Family Relationship and Child Development as Should be Approached by Demonstration Agents, Miss Mildred Jacocks, District Agent.
11:25-11:45, Using Extension Specialist in Planning and Developing Extension Program of Work, Miss Helen Cullen, District Agent.
11:45-12:00, Summary, Miss Bessie Walton.
(Men's Separate Session))
Mr. W. H. Williamson, Presiding
9:40-10:20, Improved Farm Machinery and Hints on Terracing, M. T. Gowde, Asst Agricultural Engineer.
10:20:10:40. Importance of Pastures and Livestock Production, Frank Chance, Asst. Director, Experiment Station.
10:40-11:00, Labor Outlook for 1946, Eugene Gamble, Asst Supervisor, Farm Labor Adjustment.

Farmers Use Billion Dollars in Credit During 1945

Farmers and their cooperative associations used more than a billion dollars in credit extended by the Farm Credit Administration in the year ended December 31, 1945, I. W. Duggan, Governor of the Farm Credit Administration, reports.

"The year was marked by a big demand for production credit, by continuing large repayments on the principal of farm mortgage loans, and by the largest volume of farm mortgage loans closed since 1936," Mr. Duggan stated.

Financing crop and livestock production accounted for the biggest volume of FCA loans in the year totaling $617,204,790, Mr. Duggan said. The largest amount of this financing was through the Nationwide system of production credit associations. While the number of loans made by the PCA's in the year decreased compared with the previous year, the volume was $516,115,670 compared with $490,476,633 for 1944. The emergency crop and feed loan office loaned $16,952,105, the regional agricultural credit corporation $9,646,461, and the Federal Intermediate Credit Banks, besides furnishing funds to the Production Credit Associations, discounted agricultural paper for privately capitalized financing institutions amounting to $74,490,554.

Farmers' buying, selling and servicing cooperatives obtained $361,915,040 in credit from the FCA. Of this amount, the 13 banks for cooperatives extended credit totaling $361,255,040 and the Agricultural Marketing Act Revolving Fund $660,000.

The 12 Federal land banks and the local national farm loan associations handled 41,909 long-term farm mortgage loans totaling $122,448,397 made for the land banks and the Federal Farm Mortgage Corporation. This compared with 38,845 loans and $105,292,360 in 1944.

"Despite this large volume of new farm mortgage credit written, repayments on loans made in prior years, totaling $349,110,210 reduced the FCA's volume of outstanding farm mortage loans to $1,255,984,000," Mr. Duggan said. "This reduction is in keeping with the trend in the total farm mortgage debt which has been downward since 1923 and at a greatly accelerated rate during the high-income years. It is now the lowest in 30 years being slightly over 5 billion compared with 5¼a year ago, 6½billion on January 1, 1941 and $10¾ billion at its peak in 1932."

Loans to veterans and those still in the service were given major attention in the year and accounted for $2,424,525 in long-term farm mortgage loans, and $5,646,180 in production credit association loans in the year.

SCS Official Calls For Conservation Of Nation's Soil

Chicago, Ill., Jan. 28.—Conservation of the country's farmlands was described today as vital to the continued well being of the nation and to a prosperous future agriculture by Assistant Chief A. E. Jones of the Soil Conservation Service of Washington, D. C.

In an address prepared for delivery at a meeting of the National Agricultural Credit Committee at the Federal Reserve Bank, the U. S. Department of Agriculture official reminded that 95 percent of our food and a large part of our clothing and housing come originally. from the soil. He cautioned that "our soil, like other assets, is **not** inexhaustible." He said that one-fifth of the original tillable land in the United States has been ruined for further practical cultivation, chiefly by erosion, with most of the remainder either already badly damaged or subject to erosion. He reported that war crop production demands put a further heavy strain on the land.

Jones explained the significance of this condition when viewed in the light of an expected population of 165 or 170 million by 1970 in the United States alone. He stressed particularly its importance to banking and credit interests. Their real estate holdings, farm mortgage and other farm financing, he said depend directly upon preserving agricultural land in profitably productive condition.

"Building up the land and keeping it productive is like keeping a healthy bank account," Jones told the credit group. "The overdrawn depositor finds himself without cash to pay his bills. The farmer who has overdrawn his soil account finds himself without income to buy the comforts and necessities of life, the products of industry and labor, and without funds to pay off farm mortgages and other major obligations."

He cited numerous examples of steps banks, government financing agencies, insurance companies and others have taken to encourage such sound farming. He listed other opportunities for service in this field. such as these: Extending adequate credit to finance all phases of conservation, assisting in organizing soil conservation districts where erosion hazards are the worst, and doing conservation education and recognition work.

Real progress has been made in the country's still relatively new national program of soil and water conservation, Jones reported. Farmers and ranchers of 45 states, for example, have voted approximately 1,450 soil conservation districts under state enabling acts. Through these districts, the landowners and operators deal with their land-use problems as a local group, manage district affairs themselves and call on the Soil Conservation Service or any other source available for technical or other help. More than half the farms of the United States already are within such districts, Jones reported, and farmers are organizing between 15 and 20 more each month.

The speaker's strongest plea was reserved for attention to the conservation job that remains to be done. A conservation needs survey —or "national soil audit"—that has been made by his agency, he said, shows 90 percent of the country's farmland still needs soil conservation treatment. To do the basic job in the next 15 or 20 years as facilities for doing it may be made available, will require 3 1-2 million man years of labor, regardless of its source. Also needed are 1 1-2 million horse and motor equipment year, 2 1-2 million tons of seed and many million trees and other plants.

"This is not a simple task," Jones said. "It can't be done by sitting back at a desk and deciding that one or more measures can be applied to our farmlands wholesale. Land differs, watershed to watershed, farm to farm, even field to field. That is because soil types, degree of erosion, slopes and other factors vary greatly. Accordingly, we know that we can get real, permanent soil conservation only by finding out these facts through detailed surveys, and then working out acre-by-acre conservation farm plans that the farmer uses. Such a complete plan, in other words, provides for treating every single acre as it **needs** to be treated and using every acre for the crop or other purpose for which it is best suited."

The task ahead, the Soil Conservation Service spokesman concluded is one that is of concern to business and professional people and to everybody else along with the farmers. All can help, he said, pointing out that his agency had set its 1946 goal to help in putting more conservation practices on the land than have ever been realized in a single year before.

National Family Week Dates Announced

May 5th Through 12th To Be Observed in the U. S. A.

Chicago, Ill.— (Spl.) — Declaring "war's chief casualty is the home," Dr. T. T. Swearingen, director of adult work and family life of the International Council of Religious Education, reported today that "while approximately 9 per cent of the armed forces were killed or wounded, the percentage of marriages wrecked in this period rises to several times 9 per cent, with the destruction still going on."

This was brought out in a personal statement made by Dr. Swearingen as secretary of a committee representing Protestant, Catholic and Jewish faiths planning the 1946 observance of National Family Week, May 5 12, in the United States and Canada. Other members of the committee are the Rev. Edgar Schmiedeler of Washington, D. C., director of the Family Life Bureau of the National Catholic Welfare Conference, and Rabbi Ahron Opher, assistant to the President of the Synagogue Council of America, New York City.

"Likewise in homes which hold together, the authority in many of the basic human activities has been transferred to outside organizations," the statement reads. "Family activity is no longer home centered. The child is not born in the home. He is not taught in the home. His recreation is outside of the home. Religion too has 'left the hearth.'"

Pointing out that men, women and children need the strength and emotional support which comes from good homes. Dr. Swearingen stated that "in family life which draws upon the values of true religion is to be found the only enduring basis for a better world. The home is the primary unit of life. It becomes the primary unit in a constructive society only as religious values become the heart of family relations and the basis of individual attitudes and conduct. Churches are built on sound family life, and the family is never truly sound without the spiritual resources of the religion which the churches teach."

In National Family Week the three major faiths seek to strengthen the spiritual foundations of the home, Dr. Swearingen continued. This special week helps the home, the church and the community to work together more effectively in building character and rebuilding civilization. Each church and synagogue is urged to feature the significance of religion in the family through sermons, worship, classes and other groups, and also to review its whole program in the interest of a more effective program of good family living.

280,000 Negro Farm Youths Enrolled in 4-H Clubs

Washington, D. C., Feb. 25, 1946— An all-time record of nearly 280,000 colored farm boys and girls are enrolled in 4-H clubs, Extension Service of the U. S. Department of Agriculture reports as plans are being completed for the observance of National 4-H Club Week, March 2-10.

Meeting in their 9,000 local clubs, colored 4-H'ers will take part in several activities, including the recruiting of additional members and the comparing of notes on wartime production.

For the knockout blow against Germany and Japan, colored 4-H club boys and girls raised 70,000 head of livestock, 1,700,000 chickens, put 28,600 acres in home gardens, and preserved 2,725,000 quarts of food.

"The 4-H war record has been completed," Secretary Clinton P. Anderson said, in pointing to the job ahead for 4-H'ers. "All who have had part in this great achievement can feel justly proud. The military victory is won. But whether or not we can rise to the higher challenge that the military victory brings is up to every individual, everywhere. That higher challenge is for us now to build a just and enduring world peace."

Department oficials say that 4-H clubbers recognize increased production and distribution of food as important keys to world peace. Indications are that they plan to work for the winning of the peace just as they worked to help win the war.

It is pointed out that clubbers will spend some time during 4-H Week taking inventory of their wartime achievements, but this will be done largely as a yardstick for measuring peacetime production. The greater part of their time will be spent discussing ways and means of increasing their food crops.

Conscious of the food needs in Europe, Africa, and parts of Asia, colored 4-H'ers are expected to set higher food production goals for this year. Also they will recruit more farm youths to join them and help increase the nation's food output.

Enrollment of colored 4-H clubbers is expected to increase again this year. It has been constantly increasing since 1941 when the membership was less than 200,000. The figures for 1944, latest available, show a total of 279,469 colored 4-H'ers, or a sixth of all clubbers in the nation. Boys totaled 113,930, and girls, 165,539. Mississippi, where there are nearly three times as many colored farmers as in any other State, leads the list with 49,633. Alabama is second with 37,641, and Georgia is third with 33,913. It is pointed out that if colored 4-H enrollment continues growing at its war-time rate recruitment during 4-H Week may increase their total membership to more than 300,000.

Southern States Hold Basketball Tournament Here

The second annual National Invitational High School Basketball Tournament was scheduled to open on Thursday of this week at A. and I. College with champions from seventeen states invited to participate. It was stated that where the champion team of a state could not be present the next best team of that state would be selected. Last week end the following states had announced their intention to participate:

Tennessee, Kentucky, Oklahoma, Virginia, West Virginia, Texas, Missouri, Alabama and Arkansas.

Henry Arthur Kean, director of athletics of Tennessee State College, is president of the association and B. T. Harvey of Morehouse College, Atlanta, is secretary-treasurer. The tournament, which began on Thursday, will end Saturday, March 23.

On the Agricultural Front

INDIA NEEDS WHEAT AND RICE TO WARD OFF MASS STARVATION

Delegates from the governments of India and Ceylon met with the Combined Food Board last week and explained the critical food situation in their counties.

The Indian delegate pointed out that his country—which had just suffered the worst drought in 50 years—faced mass starvation unless her urgent need for wheat and rice is met through imports. He said that India needs to import a minimum of two millions tons of cereals—principally wheat and rice—during the six months ending June 30, and an additional two million tons during the second half of 1946.

Ceylon's delegate stated that 45,000 tons of rice and flour are needed each month in order to maintain even the present stringent cereal ration of 1200 calories in his country.

The Minister of the South African Legation also will meet with representatives of the Combined Food Board to discuss the cereal needs of his country that have arisen as a result of serious drought.

Secretary of Agriculture Clinton P. Anderson told representatives of the food trades industries meeting here on March 8 that India has asked for four times more food grains than their earlier requests totaled. He said that this was due to drought which had seriously reduced all grain crops in India.

Pointing to the increased needs for food abroad, the Secretary urged the food industry representatives to develop a conservation program that will make it possible for this country to ship more food to starvation areas.

"Present export needs for wheat total 20½ million tons and only 11½ to 12½ million tons are in sight," he said, "in all the countries where wheat is produced for export. The United States has undertaken to supply a million tons of wheat monthly for the first half of 1946, but shipments so far this year have fallen below that rate."

As a step toward further assuring food for the starving peoples abroad, Secretary Anderson has designated State and county emergency food program managers to help speed the job of supplying food under President Truman's emergency famine relief program.

The designated managers are State directors of the Production and Marketing Administration and chairmen of the county agricultural conservation committees. They will set specific local food conservation goals, work out conservation measures adapted to local conditions, and marshal the forces of citizens' organizations and food trades that will help carry out the program on a voluntary basis.

NEGRO SPECIALIST HELPS SOLVE LIBERIA FOOD PROBLEM

Although Liberia is still far from producing an adequate supply of food for her people, an important step toward increased production in that country has been made by Charles E. Trout, Tuskegee trained agriculturist, who has been loaned to the Liberian Government by the U. S. Department of Agriculture.

Trout has taught the farmers to grow dry season gardens in swamp areas. Now several young farmers are selling products every Saturday from their gardens. Trout reports that the people scramble to buy the products.

The important long-range program which he has launched has been the organization of extension work to carry the teaching of modern farming practices to the farm people. Already 10 agricultural aides have been appointed to carry out farm demonstrations in various districts. One of their major projects is the establishment of demonstration plots where the Liberian farmers may come and see how the production of food crops may be increased.

However, a major handicap to increased production is the lack of tools, machinery and horse-power. To help provide more tools for the Liberian farmers, the Office of International Trade, formerly the Foreign Economic Administration has purchased a limited quantity of farm implements and is making them available to the farmers. OIT also is providing the farmers with improved varieties of seeds.

OIT's farm specialist, Frank E. Pinder, formerly of the Farm Security Administration, works very closely with Trout in the development of the agricultural program. Pinder, was for several years a colored county agent in Florida.

LA. SUGARCANE WORKERS GET 15 CENTS DAY INCREASE

Washington, D. C., Feb. 16, 1946.

A minimum wage rate of $2.45 per day, a 15 cents per day increase over 1945 rates, has been announced by the U. S. Department of Agriculture for non-harvest sugarcane workers in Louisiana this year. The rate is to be paid by all producers who apply for payments under the Sugar Act of 1937.

As in former years, producers also must furnish the workers without charge the accessories customarily supplied them, such as habitable housing, garden plots with facilities for cultivation, pasturage for livestock, and medical attention.

The Sugar Act requires, among other conditions of payment to growers, that all persons employed on farms in the production, cultivation, or harvest of sugarcane be paid in full by growers at rates not less than those determined to be fair and reasonable by the Secretary of Agriculture after public hearing and investigation.

FRATERNAL COUNCIL OF CHURCHES URGES BETTER CARE OF SOIL

Aware of the importance of the soil to the accomplishment of an effective rural church program, the executive committee of the National Fraternal Council of Negro Churches passed a resolution at its recent meeting in Memphis, Tenn., urging rural churches to take a more active interest in the problems of rural people and to take steps to encourage proper land use practices.

The resolution was presented by President W. R. Banks of Prairie View State College, Prairie View, Texas, who headed the committee on agriculture and rural life. Points brought out in the resolution were based on a recent study of rural church by U. S. Department of Agriculture soil technicians.

The study covered 222 rural churches of the Upper South Carolina Methodist Conference. It revealed that of the 222 churches, 47 were situated in areas where the land was comparatively good, 89 were in areas of poorer land, and 86 in areas where the soil was severely eroded and largely unsuited for cultivated crops.

In the good land area, the churches had an average membership of 160, in the poorer land area, 132 members, and poorest land, only 105 members. Percentage of attendance in all areas was about the same, but contributions were lower in the poorer land areas. Annual Conference reports for 1939, '40, and '41 showed that the churches in the good land area received an average of $1,135 per year; those in the poorer land area received $762, and in the poorest area, only $533. Amount available for the pastors serving the area where the land was poorest was only about $5 a week.

In urging the rural churches to encourage the farmers to take better care of their land, the Fraternal Council of Churches is joining hands with other church groups who have already taken similar steps.

INDIAN ENGINEERS STUDY REA PROGRAM

Three electrical engineers from India are here in Washington for a three week's study of the Rural Electrification Administration and its program.

The visit of the engineers is sponsored by the British Embassy to gather information for use in planning widespread development of electrical power facilities in India.

After studying administrative phases of the REA program, the engineers will visit six REA financed rural electric cooperatives for field studies of the operations of rural electric systems.

DUAL-PURPOSE FARM PONDS

Listed among the outstanding recent achievements of U. S. Department of Agriculture scientists is the development of dual-purpose farm ponds by Soil Conservation Service. The ponds not only provide water for livestocks, domestic use, irrigation, and fire protection, but they also provide a source of food and recreation as fish ponds.

During 1945, farmers in soil conservation districts stocked more than 4,000 ponds with six million fish supplied by Fish and Wild life Service and the States. It is said that the ponds should yield 250 pounds of food for every surface acre of water; and its fun catching the fish, too.

FARMERS USE FCA CREDIT

White and colored farmers and their cooperative associations used more than a billion dollars in credit extended by the Farm Credit Administration last year, the U. S. Department of Agriculture reports.

Financing crop and livestock production accounted for the biggest volume of FCA loans, totaling $617,204,790. Loans to veterans and those still in service accounted for $2,424,525 in long-term mortgage loans, and $5,646,180 in production credit loans.

NEGRO ECONOMIST RETURNS TO FSA POST; FOUGHT ON OKINAWA

James C. Peterson, agricultural economist of the U. S. Department of Agriculture's Farm Security Administration, returned to his post last week after two years in the Navy where he served in the Pacific and took part in the battle of Okinawa.

Peterson has been with the Department since 1941. He is a graduate of Fisk University and has done a year's work in agricultural economics at the University of Minnesota.

WE ATE WELL LAST YEAR

Although wartime food shortages sometimes made meal planning difficult, the nutritive value of the average civilian diet was higher in 1945 than before the war or in the early years of the war, say food economists of the U. S. Department of Agriculture.

The improvement in diet was due partly to the fact the people had more money to spend, and partly to the fact that the nation is becoming more nutrition conscious.

However, many people still do not get enough of the foods that make for a nutritionally adequate diet, according to studies made by the Department's Bureau of Human Nutrition and Home Economics.

The Bureau estimates that if everyone in the United States were to follow its moderate cost food plan, at least a fifth more milk would be needed this year than was consumed last year, about 10 to 20 percent more citrus fruit and tomatoes, and fourth more green and yellow vegetables.

At price levels prevalent during the latter part of last year, the weekly cost of food for a family of four probably would be about $12 to $14 by the low cost diet, and $16 to $18 by the moderate-cost plan. Copies of these plans are available in a bulletin entitled, "Family Food Plans for Good Nutrition" AWI 78. This bulletin may be obtained by writing the U. S. Department of Agriculture, Washington, D. C.

80 PERCENT FLOUR

The President's order calling for 80 percent flour means that our bread will be slightly darker in color, but more wheaty in flour and more enriched by nature's processes.

Officials of the U. S. Department of Agriculture point out that for a long time modern white flour has been losing important values in the milling. In order to have flour white and with fine keeping qualities, millers have been removing the outer coat of the wheat berry and with it about seven eighths of the thiamine and niacin, three fourths of the riboflavin, and four fifths of the iron, as well as some calcium, phosphorus, and some protein of better quality than the heart of the grain contains.

Enrichment, of course, has returned some of these values—the three B vitamins, thiamine, riboflavin and niacin, as well as iron. But only 65 percent of the flour and flour products have been enriched. If present levels of enrichment are continued, the new 80 percent flour will have the same values in B vitamins and iron in addition to improved protein quality. And the unenriched 35 percent will have considerably more thiamine than the unenriched white flour has had, because it will not have been removed in the milling process. Also, it will have more riboflavin, iron and niacin.

Eighty percent flour not only means more bread for the hungry peoples of the world, but it also means more nutritious bread for the folks here at home.

WORLD FOOD PROBLEM

The three chief causes for the critical world food situation are: (1) a 1121 percent per capita reduction in total world food production in 1945 as compared with pre war levels, (2) this reduction has taken place chiefly in countries that are normally dependent on imports, and (3) distribution in wartorn nations has been disrupted. These causes were revealed in a U. S. Department of Agriculture report prepared by the Office of Foreign Agricultural Relations.

CREDIT AND COUNSELING FOR VETERANS ON FARMS

Washington, D. C., Mar. 11, 1946.

Several thousand white and colored veterans who have received loans to go into farming are being helped through the counseling service of the Farm Security Administration to catch up with the changes in agriculture which took place during the war, the U. S. Department of Agriculture reports.

Already FSA has made loans to 9,000 veterans of World War II to help them get started in farming. Along with the credit goes individual counseling in modern efficient farm management.

The first step in counseling is taken when the FSA supervisor helps the veteran make out a plan for the operation of his farm. This includes the acreage to be planted in various crops, the number and type of livestock needed, soil conservation practices to be followed, and similar details.

Next, the veteran uses the loan which he has received from FSA to put his plan to work. Loans are made to veterans who are unable to obtain elsewhere adequate credit to buy equipment, livestock, feed, seed, fertilizer and various items needed for the farm household. Veterans may also receive loans to buy farms of their own.

When the veteran gets started in farming, the supervior advises him on special problems and keeps him in touch with the latest developments in modern farming. Most of the counseling is carried out on the veteran's farm.

ANDERSON ASKS FARMERS TO PRODUCE MORE FOOD

Secretary of Agriculture Clinton P. Anderson has asked the nation's white and colored farmers to revise their 1946 production plans in order to contribute further to meeting the critical world wide need for food.

He has requested that the wheat goal be increased by a million acres, the corn goal by a million acres in the Corn Belt, and additional acreages of both corn and sorghums in other areas. The Secretary also has asked the farmers to increase their soybean goal by 1,110,000 acreas, and smooth dry edible beans by 100,000 acreas.

The white and colored farmers in Mississippi, Louisiana, Arkansas, Tennessee, Kentucky, North Carolina, Virginia, and Maryland are asked to plant 136,000 additional acres of soybeans.

4-H Youths Tackle Knotty Farm Problems

These six Maryland farm youngsters are typical of the 280,000 colored 4-H club boys and girls who will sit around conference tables discussing knotty farm problems during National 4 H Club Week, March 2-10. One of the big problems which 4-H'ers all over the South will be discussing is how to grow better gardens and produce more poultry and livestock. The youngsters above are checking last year's production figures and making plans for increasing their food crops this year. Left to right, they are Geraldine Brewer, Randolph Lewis, Lucille Crump, Rodell Gaither, Margaret Brewer, and Joseph Conway, all of Prince George County, Md.

WOMAN'S PAGE

LOOK! MUFFINS MADE WITH PEANUT BUTTER

(No shortening and only ¼ cup sugar)

If you'd like to try something brand new in muffins that's truly delicious and saves on shortening, too—try Kellogg's new PEANUT BUTTER MUFFINS. You'll love their flavor. You'll love too, the tender, melt-in-your-mouth texture of bran muffins made with Kellogg's All Bran. For All Bran is milled extra fine for golden softness.

1-3 cup peanut butter
¼ cup sugar
1 egg, well beaten
1 cup milk
¾ cup Kellog's All Bran
1 cup sifted flour
1 tablespoon baking powder
½ teaspoon salt

Blend peanut butter and sugar thoroughly; stir in egg, milk and Kellog's All Bran. Let soak until most of moisture is taken up. Sift flour with baking powder and salt; add to first mixture and stir only until flour disappears. Fill greased muffin pans two thirds full and bake in moderately hot oven (400 degrees F.) about 20 minutes. Makes 10 tender, tasty muffins.

RASPBERRY CHIFFON PIE

1 pint quick-frozen raspberries
Water
½ tablespoon gelatin
3 egg yolks
1-3 cup sugar
Few grains salt
Lemon juice
3 egg whites
3 tablespoons sugar
Baked pie shell

Reserve two thirds cup of the raspberries. Obtain juice from remainder of box and add enough water to make two thirds of a cup of liquid. Put in top of double boiler with gelatin. Let stand until liquid is absorbed and then place over hot water until gelatin is dissolved. Add the egg yolks mixed with sugar. Add salt and beat over hot water until very light and thick. Cool and add berries with lemon juice to taste. At this point you may add some red food coloring if you want a deeper raspberry hue. Beat egg whites until stiff. Beat in sugar and fold into berry mixture. Pile in a baked pie shell. Chill and cover with whipped cream.

CURRIED CHICKEN

3 tablespoons butter
¼ cup chopped onion
1 cup flour
1 teaspoon curry powder
1½ cups milk
½ cup chicken stock or soup
1 teaspoon salt
Dash pepper
2 cups cooked chicken
6 cups Chinese noodles

Melt butter in a saucepan; add onion, and cook until tender. Add flour, curry powder, and blend. Stir in milk and chicken broth gradually, and cook over low heat until thickened. Add salt and pepper and cooked chicken; heat until piping hot and serve on Chinese noodles. Serves 6.

HOMEMADE COLE SLAW

2 cups finely shredded cabbage
1 tablespoon chopped green pepper
2 tablespoons shredded carrots
2 tablespoons lemon juice
2 tablespoons vinegar
1 tablespoon olive oil
1 tablespoon mayonnaise

Shred cabbage fine; soak in ice water for one hour to make it thoroughly crisp. Drain. Add green pepper and carrots. Mix together vinegar, sugar and olive oil. Pour over cabbage. Stir in mayonnaise. Season to taste with salt and pepper.

Make sandwiches of dark and light bread, cut to the shamrock pattern. Cheese spreads in these sandwiches are particularly good as an accompaniment to the suggested salad.

APRICOT NUT BREAD

1½ cups dried apricots
½ cup granulated sugar
2 tablespoons shortening
1 egg
1 cup sour milk
1 cup bran
½ cup chopped blanched almonds
2 cups sifted all purpose flour
5 teaspoons baking powder
½ teaspoon salt
½ teaspoon soda

Rinse apricots, boil 5 minutes, drain and chop. Cream sugar with shortening, add beaten egg and milk. Combine with bran, apricots, almonds, and beat thoroughly. Add flour sifted with baking powder, salt and soda. Mix well. Pour into a greased bread pan and bake about 1 hour in a slow oven (275 degrees).

COTTAGE CHEESE RING SALAD

1½ tablespoons gelatin
1-3 cup cold water
3 cups cottage cheese
1 teaspoon salt
¼ teaspoon paprika
Dash cayenne
¾ cup light cream
3 cups mixed diced fruits (bananas, oranges, unpeeled red apples)
½ cup mayonnaise or salad dressing

Sprinkle gelatin on cold water; dissolve over hot water. Combine cheese, seasonings, cream and dissolved gelatin; mix well. Turn into 1-quart ring mold which has been rinsed in cold water. Chill until set. Unmold on salad greens. Fill center with mixed diced fruit. Serve with mayonnaise or salad dressing. Serves 6.

TOMATO CREAM DRESSING

1 teaspoon salt
1 teaspoon mustard
2 teaspoons sugar
Few grains cayenne
2 tablespoons flour
1 egg yolk
2 tablespoons oil
¾ cup scalded milk
¼ cup vinegar
2 tablespoons tomato catsup

Mix the salt, mustard, sugar, cayenne and flour in top of a double boiler. Beat egg yolk slightly and add oil, then slowly add scalded milk and vinegar. Mix well and add tomato catsup. Stir over hot water until mixture thickens. then strain and cool. Serve over celery cut in narrow strips one to two inches long.

BROILED POTATOES WITH GRATED CHEESE

Cook 3 or 4 large potatoes in boiling salted water until tender. Peel and cut in half inch slices length wise. Place on broiler rack. Sprinkle with salt and pepper and brush with melted butter or margarine. Broil until they begin to brown. Turn over and sprinkle lightly with grated cheese mixed with a bit of cayenne. Broil until cheese melts. Serve garnished with finely chopped parsley.

One theory as to why engagement and wedding rings are worn on the third finger of the left hand is that the Egyptians believed a vein ran from that finger directly to the heart.

CREAMED EGGS AND SHRIMP

4 tablespoons butter or margarine
½ teaspoon salt
⅛ teaspoon pepper
1½ cup milk
1 teaspoon grated horseradish
3 hard-cooked eggs, coarsely chopped
2 cups shrimp, coarsely chopped
¾ cup oven-popped rice cereal
1 teaspoon melted butter or margarine

Melt butter or margarine, stir in flour and seasonings. Add milk slowly, stirring constantly. Cook over low heat, stirring frequently until thickened. Place over hot water. Add horseradish, egg and shrimp; heat thoroughly. Serve on toast or in toast cups. Sprinkle with rice cereal which has been crushed and mixed with melted butter. Yield: 6 servings.

COOKERY TIPS

Add a teaspoonful of celery seed to the dry ingredients, when making biscuit dough for a meat pie crust.

Try a lattice top on a meat pie, using strips of cheese pastry. This is especially good with ham or corned beef.

Marjoram is a fragrant annual of the mint family. Leaves are dried and used whole or powdered to flavor soups, salads, stuffings, meats and sausage. The best grade comes from France, though grown also in northern Africa and Chile.

SAUTEED GREEN PEPPERS

Remove seeds from peppers and place in boiling water for five minutes. Remove from water and remove thin outside skin. Cut into small pieces and saute in butter or margarine (or bacon drippings) until tender and slightly browned. Season with salt and pepper.

CREAMED RADISHES

Wash and cut the roots and tops from 3 bunches of radishes. Cook in boiling salted water until tender. Drain. Melt 1½ tablespoons butter in a double boiler, add 2 tablespoons flour and mix well. Gradually add 1¼ cups milk and cook, stirring constantly, until thickened. Add ½ teaspoon salt, dash of pepper, and the radishes. Reheat. Serves 4 to 6.

HELPFUL HOUSEHOLD BREAD SAVING HINTS

"Reach for a potato instead of more bread," is a timely slogan for Americans who are looking for good ways to help save wheat.

At breakfast, potatoes can replace wheat cereal, toast, or biscuits some mornings. If every minute counts, sliced potatoes can be fried country style, using a very small amount of meat drippings to help them brown nicely. Potato cakes can be made from left over mashed potatoes, or hash browned potatoes can be quickly prepared from boiled potato leftovers.

Letting potato salad take the place of a sandwich is one way to use less bread at lunch or supper time.

Potatoes can replace bread in stuffings, and potatoes can make a fluffy topping for meat pies and some other baked dishes instead of top crust.

Never put butter in a cold frying pan.

A small magnet is useful to pick up and hold pins when sewing.

DOUBLE TREATS FOR BABY

Babies and toddlers go for fruit ful surprises in the dessert department. Try these combinations:

1. Any of the strained fruits on sliced banana.
2. Custard pudding under a serving of strained fruit or as a topping.
3. Stir strained fruit into the custard pudding just before serving. (An inspiration for using 2 or 3 spoonsfuls of "leftover" fruits, so that the dessert appears in fresh and attractive form.)

Oil of wintergreen is not only found in the shrub called wintergreen but is contained in strawberries, blackberries, raspberries, currants, plums, apples, peaches and some other common fruit.

HOW TO MAKE GOOD ICED COFFEE

Method : Pre cooled and served --with ice (Regular Strength)

Make regular-strength coffee by your favorite method. Use 1 heaping tablespoon of coffee for each ¾ measuring cup (6 oz.) of water. When coffee is made in metal maker, pour into enamel, glass, china, or earthenware container; cover securely and allow to cool. Place in refrigerator, if desired. To serve, pour the chilled coffee into tall glasses half-filled with ice. (From three-fourths to one cup of cooled coffee is needed for each serving, depending on the size of glasses used.) Serve with sugar and plain or whipped cream.

Method II: Poured hot, over cracked ice (Extra Strength) --

Make extra strength coffee by your favorite method. Use half again as much coffee as for regular strength brew. Pour the hot, freshly made coffee into tall glasses filled with ice. The extra strength coffee will make up for dilution by the ice without loss of flavor. (From one half to two thirds cup of hot coffee is needed for each serving, depending on the size of glasses used.) Serve with sugar and plain or whipped cream.

SHRIMP AND RICE WITH CURRY AND SPICE

A rice ring laced with green pepper holds this spicy canned shrimp curry that tastes like something right out of a Somerset Maugham novel. An inspired warm weather dish, this East Indian favorite is the answer to a hearty low point meal that is rich in protein and vitamins A and D. Curries are due for a big boom when the boys march home from far off places, so practice up now with this simple one which need only one seven-ounce can of shrimp for four generous servings.

AMERICAN SHRIMP WITH A FAR EAST FLAVOR

American cookery, never an isolationist, is going to become more international than ever on that happy day when the boys come marching home with their palates educated to fiery southern stews and subtly flavored dessert dishes. Lads whose entire knowledge of spice was limited to the cinnamon in mom's apple pie will be demanding East Indian curries and Egyptian sweetmeats and mom had better know how to whip them up.

But don't wait for the boys to come home to try this shrimp curry. Made with firm, tender canned shrimp it's that "something different" you've been looking for to vary the hum drum of rationed meals. Canned shrimp is not only a good source of protein and vitamins A and D, but of 18 important minerals as well which are far more than are usually found in a single food.

Straight from the land of overwhelming temperatures shrimp curry is a summer favorite with those who understand the art of keeping cool. Here's how to do it, together with some other spicy dishes:

SHRIMP AND TOMATO CURRY

1 7 oz. can shrimp (1¼ cups)
2 tablespoons salad oil
¼ cup chopped green pepper
3 tomatoes
2 cups thin white sauce
2 teaspoon curry powder
4 cups cups cooked rice

Drain shrimp. Heat salad oil; add shrimp and chopped pepper. Saute gently until lightly browned. Cut tomatoes in wedges; add: Cook 5 minutes. Blend a little white sauce with curry; add to remaining sauce. Arrange rice in ring on serving plate; garnish with green pepper strips. Pile shrimp mixture in center; add curry sauce. Serves 4 to 6.

SAVORY SHRIMP

1 7 oz. can shrimp (1¼ cups)
¾ cup top milk
¼ cup soft bread crumbs
¼ cup diced celery
1 egg yolk, beaten
¼ teaspoon salt
¼ teaspoon paprika
¼ teaspoon Worcestershire sauce
2 tablespoons mayonnaise
½ tablespoon lemon juice
1 stiffly beaten egg whites
½ cup buttered bread crumbs

Shred shrimp; combined with remaining ingredients except egg white and buttered bread crumbs. Fold in egg white; pile mixture in greased ramekins. Sprinkle with buttered crumbs. Bake in moderate oven (350 degrees F.) 25 minutes. Serves 4 to 6.

SHRIMP SOUTH AMERICAN

1 small red onion
2 tablespoons butter or margarine
1 7-oz. can shrimp (1¼ cups)
3 medium tomatoes, diced
1¼ cups medium white sauce
½ teaspoon salt
Few grains pepper and cayenne
1 tablespoon cream

Peel and slice onion. Saute in the butter or margarine with shrimp about 5 minutes. Add tomatoes; cover; simmer 10 minutes. Add white sauce; cook 5 minutes longer. Add salt, pepper and cayenne. Add cream; if desired, serve in individual ramekins topped with a little chopped parsley. Serves 4.

RULES AND REGULATIONS NATIONAL SEWING CONTEST

1. All contestants must submit their names immediately to Neil Scott Associates, 400 Manhattan Avenue, New York, N. Y.

2. There are 4 divisions in which you may enter articles—knitting, crocheting, embroidery, and general sewing. You may win a $100.00 ringside seat to the Joe Louis-Billy Conn fight by producing a winner in either division.

3. International fashion and sewing experts will judge the winner in each division.

4. The prizes will be awarded on June 18th at a place in New York City to be announced later.

5. All articles submitted to Neil Scott Associates must be insured and enough postage included to cover the expense of return mail.

6. You must notify Neil Scott Associates as to what division of the Contest you are entering.

7. You pay no money to Neil Scott Associates to become a contestant. Your written statement of interest in the contest is considered as an application.

HURRY-UP VITAMINS

It took only a year and a month after plant specialists at the Inter-American Institute of Agricultural Science sat Turrialba, Costa Rica, crossed a wild tomato with a commercial variety for American GI's to have good tasty tomatoes to eat. This almost unprecedented quick result followed good luck, good management, the wartime pressure for food and the rapid growth of plants in the tropical areas.

The hybrid tomato, which has been named "Turrialba" is one of the first fruits of Latin American co-operation at the Institute and was found after staff workers had tried out twenty-eight tomato varieties and found none of them did well.

Joseph L. Fennell, who formerly worked for the U. S. Department of Agriculture as a specialist in semi-tropical plants in Florida, but now a member of the Institute staff, reports the tomato breeding experience in the December issue of **Agriculture in the Americas**, official publication of the Office of Foreign Agricultural Relations.

In March, 1944, according to Mr. Fennell, a wild tomato of the cherry type was brought to the Institute. This was crossed with a commercial tomato—the "Cuban Marglobe," an offshoot of the widely popular Marglobe tomato introduced twenty years ago by the U. S. Department of Agriculture—and hybrid seed for planting in November and December were obtained. Out of these plantings came enough plants for an abundant seed stock and also 400 crates of standard grade tomatoes for the troops last spring.

The "Turrialba" has not yet been fixed as to type, and, therefore, the breeders cannot release it for commercial planting, but each generation of seeds brings the plant closer to "release" as roguing and selection destroys plants not up to standard.

THE MODERN FARMER

VOL. XIX. NASHVILLE, TENN., APRIL 15, 1946 No. 3.

The Road Up An Inspiring Day

By

GILES A. HUBERT

I had one of the most inspiring days of my life last month. Ocie Lee Smith asked me to come over to Pine Bluff to make a talk on occasion of the honoring of the Arkansas "Farm Family of the Year." During the morning of that day, we paid a visit to the home and farm of Mr. Roy Collins and his family. In the afternoon there was the meeting when the neighbors of the Collins family, many other farmers of the area, Arkansas State College, representatives of the city of Pine Bluff and the State of Arkansas all assembled to pay homage and honor to this humble yet proud farm family and its achievement.

In 1939, the Roy Collins family bought, with the help of the Farm Security Administration, a delapidated, worn out sixty acre farm But Mr. Collins had faith in that land and in his own ability to rebuild its original fertility. This, in face of the fact that the former occupants had failed on the same land, they said, because of its worn out and unfertile condition.

A new house was built, new barn, smoke house, chicken house and fences. All this cost money and Mr. Collins had to go into debt. The "criticizers" said it could not be done. Well, last year Mr. Colins made 37 bales of cotton on 26 acres of that same land. He sold this for $4000. He also had 400 bales of hay and 461 bushels of corn worth $521 and he took in $217 from sales of potatoes, cattle, hogs and poultry.

The family also canned 900 quarts of fruits and vegetables and had $916 worth of food produced for home consumption. They had reduced their indebtedness from $4700 to $1,978. Mr. Collins could have already paid out in full, but he chose instead to increase his farm equipment and put comfortable furnishings in his house.

There was a green lawn in front of the house with shrubbery and flowers. The fence corners were clean. There was no wasted land on the farm. The smokehouse full of cured meat and other stored foods. There was money in the bank for next year's operations. Don't tell me that it can't be done!!

The significance of this day was not simply that the Collins family in Jefferson County, Arkansas, had been successful. It was that this family represented and typefied several thousand likewise humble but courageous Negro farm families who have been aided by FSA and other federal and local agencies to get a hold of the necessary land and capital resources to develop FAMILY FARMS WHICH CAN COMPETE IN A MODERN COMPETITIVE AGRICULTURE.

Last month we told the story of a fine group of farmers in Georgia who had paid out for their farms and many others who were making rapid progress toward a secure

Arkansas Honors FSA Farm Family Of The Year

Poor Meal Planning Results in Mulnutrition And Ill Health

Good eating at home, at work, and at school is essential to good health, say nutritionists of the U. S. Deparment of Agriculture, who point out that by eating balanced meals and cutting down on waste, the American people can share their food with the hungry peoples abroad and still have plenty for heathful meals.

Through school lunches, industrial feeding program, through information about nutrition made available to homemakers, and other programs, USDA is helping to conserve food and improve the eating habits of the American people, nutritionists state.

They point out however that although the American people spend about 30 billion dollars a year for food, there are far too many cases of malnutrition due to poor meal planning, improper selection of foods, and waste.

The "basic seven" foods should be the pattern for meal planning at home, and for meal purchases at work and at school, nutritionists say. The "basic seven" foods are: (1) green and yellow vegetables, (2) oranges, tomatoes, or grapefruit, (3) potatoes and other vegetables and fruits. (4) meat, poultry, fish, eggs, dry beans and peas, (5) milk and milk products (6) enriched bread and cereals in limited quantities so that our neighbors abroad may not starve, and (7) butter and margarine fortified with vitamin A. Department nutritionists suggest that at least one serving from each group should be eaten every day in order to ensure good health.

Meals prepared under the industrial feeding program and for school lunches follow the "basic seven" pattern. It is pointed out by nutrition specialists that many workers and school children rely chiefly on the one meal they get at work or at school for their day's supply of vitamins and minerals.

Surveys show that school lunches and cafeterias in industrial plants reduce absenteeism and step up efficiency. Industrial plant managers are enthusiastic over in plant feeding, and teachers report that school lunches improve scholarship.

At the peak of the school term last year, about a million colored youngsters were participating in the program, eating nourishing, well balanced lunches.

To help meet the need for fresh

THE ROY COLLINS FAMILY, winners of the Farm Security Administration's Farm Family of the Year contest. Tamo community, Jefferson county, Arkansas. March 27, 1946.

Georgia Agricultural Extension Service Activities

By A. S. Bacon,
Assistant Supervisor—Negro Work

In keeping good agricultural Extension Service practices. Negro county agents throughout the state have been busy giving methods of producing and living, the Agricultural Extension headquarters at Georgia State College reported recently The demonstrations were given in various seasonal activities. Some of the jobs demontrated are as follows: pasture development, swine production, treating of seed before planting, corn production and dairy product production for home use and sale:

Agents in Wilkes and Clarke counties have given demonstrations in pasture development and milk production. This effort is being put forth to help farmers get additional farm income and at the same time increase the milk supply for home use. Eight demonstrations have been given in these two counties.

Farmers in Dougherty county were given demonstrations by the agent in swine sanitation and production. Six demonstrations were given in this county alone in this project.

Negro county agents in the state gave this month a toal of 407 demonstrations with an attendance of 7,607 persons.

Colored Victory Gardeners Urged To Continue War Time Efforts

The two million colored Victory Gardeners, who produced thousands of tons of food during the war, are called on again this year to grow gardens to help feed the hungry peoples abroad, said Secretary of Agriculture Clinton P. Anderson this week.

Pointing to the important contributions which colored Victory Gardeners made toward the winning of the war, Secretary Anderson said that of the 18,400,000 who grew gardens last year, about two million of them were colored rural and urban families who produced large quantities of vegetables and fruits. "It is my hope that both white and colored home gardeners will do well this year as they did last, and if possible, do better."

Turning to starvation abroad, the Secretary said, " We shall do all that is humanly possible to keep faith with the starving peoples of other nations by making available as much of our food as we can possibly spare.

--------Every family must bear a part of the burden by conserving food in every practical way and by raising a Victory Garden if possible."

It is pointed out that the hungry peoples of the nations abroad are

Exercise Held At State College In Pine Bluff, Ark

Pine Bluff, March 27—The Roy Collins family of the Tamo community near Pine Bluff, Jefferson County, has been chosen as the state winner in the Negro division of the "Farm Family of the Year" contest sponsored annually by the Farm Security Administration in Arkansas. A celebration in honor of this outstanding family was held in Pine Bluff, March 27, by means of a tour and inspection of the Collins farm at Tamo and a program in the afternoon at the AM & N College at Pine Bluff.

The Pine Bluff Chamber of Commerce awarded a Sterling silver platter to the Collins family and tribute was paid by state and county officials. Mr. Giles A. Hubert, Professor of Economics at Fisk University, Nashville, Tenn., was the principal speaker during the afternoon program. Mr. Hubert paid tribute to the outstanding work done by the Collins family in winning the award as the "Farm Family of the Year." Mr. Jodie Anderson, PSA Director for Arkansas, was a featured speaker. L. A. Davis, President of AM & N College presided and Mr. Ocie Lee Smith, Special Representative for the Farm Security Administration, Regional office, Little Rock, was master of ceremonies.

State and county officials of the Farm Security Administration were introduced by Mr. Elstner C. Beal, FSA Supervisor, Jefferson County. Mrs. Ivie Foster, Associate FSA Supervior for Jefferson County, presented the Collins family to the audience. Mr. C. D McKindra, Assistant County Agent, spoke in tribute to the Collins family Mr. Arthur Lee represented the Pine Bluff Chamber of Commerce. Music for the program at the college was furnished by the college choir under the direction of Mrs. Aires.

Prior to the afternoon meeting at AM & N College, Mrs. Bonnie Gardenshire, Assistant Home Man-

Offers Program To Reduce Negro Migration To North

Washington, D. C.—(NNPA)—Diversification of the South's economy would lessen the migration of colored people to industrial centers of the North, according to the annual report of Secretary of Agriculture Clinton P. Anderson, which recently was made public. Mr. Anderson believes that widening the farm and urban opportunities in the South would cut down migration northward.

One of the causes of migration of colored people from Southern rural areas to Northern industrial centers is the mechanization of cotton production. Mr. Anderson believes that it is impossible to stop such mechanization and to offset it he urges development of a program for employing displaced Southern labor.

URBAN JOBS

"More urban jobs will benefit the South's farmers as well as the surplus farm population, through the growth of nearby markets for milk, eggs, fresh vegetables and fruit," he said. "In short, local industrialization will provide more work on, as well as off Southern farms."

He added that more diversity in the South's economy, both on and off the farm, would actually lessen the need to move away from cotton.

Soil preparation and cotton cultivation by mechanical power, the report reveals, are common already and it is believed that thru mechanical devices the labor requirement for the entire job of producing cotton can be held down to about eight hours for each acre or one-third of what it was formerly.

How Homemakers Can Help Save Food To Fight Famine

Home help is wanted. There's a job for every homemaker to do in getting food to the world's starving masses. The time to start is NOW.

Wheat and wheat products_____ food fats and oils_____these are the mainstays in food supplies being shipped overeas to avert famine. The President's Famine Emergency Committee has called on householders to "reduce your purchases of wheat product by 40 percent and fats by 20 percent."

Here are some ways to work out this reduction, by using other foods, and by being thrifty with the wheat and fat we do use—to the last crumb and drop.

POTATOES "Reach for a potato instead of bread."

One small serving of potato can replace a slice of bread nutritionally, and the potato offers some vitamin C. besides.

At breakfast, let potatoes replace wheat cereal, toast, or biscuit.

If every minute counts, fry sliced potatoes country style, using a small amount of meat drippings to help them brown.

Make potato cakes from left-over mashed potatoes.

Prepare hash brown or creamed potatoes from boiled potatoes left overs.

Let potato salad take the place of a sandwich.

In making stuffings for meat or poultry, use potatoes rather than bread.

Top meat pies and other baked dishes with fluffy mashed potatoes instead of pastry crust.

Serve creamed meat, chicken, or fish on mashed potato instead of on toast.

In place of poached egg on toast, try eggs baked in nests of mashed potato.

Make pancakes using fresh grated potato to replace a large part of the flour.

Let cold mashed potatoes do duty for some of the flour in making hot potato scones.

OATMEAL

An average serving of oatmeal without sugar and cream equals approximately two slices of bread in food value.

If every man, woman and school child will replace two slices of bread with a serving of oatmeal each week, this would mean 135,000 tons of wheat for the hungry in 4 months time.

Use oatmeal to replace part of the wheat flour in making bread, biscuit, muffins, pancakes, cookies.

Use leftover cooked oatmeal as thickening for gravies, soups, and stews. Use cooked or dry oatmeal a binder in meat loaf, in place of bread crumbs.

Serve a Scotch soup occasionally, made with rolled oats, potatoes, meat broth, and savory seasonings.

Use cooked oatmeal instead of bread in making fruit betties and puddings.

CORN MEAL

Where corn meal is plentiful, use it in cornbread, muffins, griddle cakes, etc.

Use leftover cornbread in stuffings.

In place of a rice pudding, make Indian pudding which contains corn meal.

Make extra cornmeal mush, to slice and fry in meat drippings—and serve hot. The fried slices make a hearty breakfast dish, or can take the place of wheat at other meals.

BARLEY AND BUCKWHEAT

Use pearl barley when available to give body to soups and chowders, instead of rice, or spaghetti or vermicelli.

Don't overlook buck wheat cakes as cereal food for breakfast.

WHAT ABOUT RICE?

Rice eating countries of the Far East report such imminent mass starvation that every "additional ounce" they receive is valued. In this country we can——

Use potatoes or hominy grits wherever possible in place of rice in the main course of the meal.

Avoid throwing rice at weddings now, when it is so urgently needed to feed hungry people.

THRIFTY WAYS WITH WHEAT BREAD AND FLOUR

Prevent waste of bread. It is estimated that one slice out of every loaf of bread baked every day goes into garbage. That is enough bread to feed a million people in devastated countries for half a year.

To keep bread fresh and prevent mold, store loaves in moisture proof paper wrapping in the refrigerator. Or if refrigtrator space is not available, store bread unwrapped in a well ventilated box, in a cool place, and scald and sun bread box often. Dry bread can be used, but moldy bread is a total waste.

Follow the lead of the restaurants and serve only enough bread for one slice a piece for each person at the table. Let the family ask for "seconds", and think up ways to make the crusty heel of the loaf a prized piece.

Where bread is baked at home, bring back the old time custom of slicing bread on the table, and be ready to halve the slices to fit slender appetites.

Dry bread makes good toast. Besides plain toast, don't overlook such kinds as French, cinnamon, hot milk, cheese, jelly, and the thin Melba toast that smart restaurants often serve in place of soft bread.

Use dry bread in subsantial deserts such as bread and cereal puddings, and baked fruit scallops made of slices or "fingers" of bread combined with canned or fresh fruit and a little sweetening and fat.

Turn odds and ends of bread into dry crumbs. Familiar uses of crumbs are coating foods for frying and topping baked dishes, and stuffing vegetables or meat, there are bread crumb specials.

Watch, when toasting and baking. Burned bread feeds nobody.

In making sandwiches, don't trim off and discard crusts. For sandwiches served at home make the open faced type, using one slice of bread instead of two, or better yet, try to let abundant perishable foods take the place of sandwiches entirely.

Don't hoard or waste flour. Buy flour only as needed and keep in a cool dry place, safe from insects and rodents.

Watch flour supplies closely in summer, if flour must be kept in a warm kitchen. Weevils are likely to develop if flour is stored in a warm room for a long time. "Feed hungry people, not weevils with your flour" might be a slogan.

THRIFTY WAYS WITH FATS AND OILS

A teaspoon of fat a day saved by every man, woman, and school child will mean a total saving of at least one million pounds of fat a day.

Buy table and cooking fat only as needed_____some fats turn rancid if kept too long. Make best use of every bit of fat you have, whether bought as fat or whether it comes with meat, fish, and poultry.

Bake and broil fish, instead of frying. Some fish have plenty of fat of their own for seasoning.

Serve home-made boiled salad-dressing instead of rich salad dressings. Or better yet, serve raw vegetable relish with salt for seasoning.

Make single crust open faced pies in place of two-crust kinds. Or use pastry squares on top of stewed fruit in lieu of pie. In place of pastry or cake, make the most of fresh fruit in season for deserts.

Put on ice for the duration of the emergency your taste for French fries and other foods fried in deep fat.

Trim excess fat from meat and poultry before cooking. Render separately at low temperature and strain. Save cracklings for fat and flavor in cornbreads, muffins, stews, and soups.

Collect drippings from broiler, roaster, frying pan, and the top of the soup kettle. Salvage and sterilize fat from plate waste Remove uneaten fat and meat, render carefully and strain.

Store meat drippings and render fat in separate labeled jars, or make an all purpose blend. Keep cold, dry and covered.

When fat's on the fire, watch the flame. No smoking is the rule. Once fat reaches the smoking point, it breaks down chemically, soon turns rancid,, and loses its sweet flavor.

Good ways to use saved fats are.

Number 1 use in gravy. Use saved fat olso in sauces for scalop-dishes. Or add it to soups.

Flavor vegetables with it. Add to plain boiled vegetables, mash with potatoes, mix with a little vinegar and use as a dressing for wilted lettuce, top off a baked potato with it, use for planning cabbage, squash, and other vegetables.

Add during cooking to meat that hasn't enough fat of its own.

Add during cooking to meat that hasn't enough fat of its own.

Make it the fat in meat piecrust, cake, gingerbread, waffles, muffins, biscuits, stufing or poultry or meat, macaroni, and other cereal dishes.

"Butter" bread crumbs in it.

To mask the flavor of lamb, mutton and other such fats, combine with onions or mixed vegetables in soup, or use as the shortening in crust for meat pie or in spice cake, gingerbread, or orange cakes or cookies.

Turn in for salvage to be used in making soap every drop of fat unfit for use as food.

GARDENS AND FOOD PRESERVATION

Home gardens and home food preservation have a special job again this year. Whatever we do for ourselves—in planting gardens, eating home grown fruits and vegetables, putting up food for winter—frees more foods of the kinds that can be shipped abroad, and lightens transportation loads.

FOOD FOR THOUGHT

Our food supply is on a scale that allows 3.400 calories per person. Some of this vanishes in waste, but there is still national abundance. Overseas. the urban population in half of Europe is existing on less than 2,000 calories and in some areas less than 1,500 calories a day—and over there good food is not wasted.

Farmers Urged To Take Care of Their Machinery

With farm work depending increasingly upon machinery, one should recognize that machinery correctly oiled, adjusted and repaired does the most efficient work, say Extension specialists in rural engineering of the U-T College of Agriculture. And it is emphasized that machinery should be ready before it is needed in the field.

This is especially important since there has been for several years a shortage of new farm equipment—a shortage that is likely to continue through this year.

Act—Or Perish

The Supreme Being must be chuckling to himself as Government and military authorities talk of the "next war." Only scientists seem capable of recognizing the import of the atomic age. Only they seem to realize that mankind cannot survive an atomic conflict "Planning" for the next war means planning for extinction.

The book "One World or None" describes what would happen if some morning an atomic bomb should fall on New York: "Half a mile in the air above the target the bomb bursts. About 300,000 of the persons living or working in an area of less than 200 blocks on Manhattan Island suddenly cease to exist. Another 300,000 are seriously injured. And thousands, who apparently escape, are to die of the effects of radiation. The destruction of property in incalulable and it is not confined to this area. Many blocks away other buildings collapse or are damaged, killing and maiming hundreds in the ruins."

The above book was written by a headline hunter. It was written by levelheaded men of science who do not frighten easily, As Raymond Moley, writing in Newsweek expressed it. "These men are in the top reaches of science. They are putting their hardearned distinction literally on the line.... They are telling the statesmen of all nations the people of all countries—they are telling you—to understand, to consider, to remember and to act—or perish."

Only the Fit Survive

Many persons have the curious notion that large businesses have no problem of survival, that they are beyond the hazards of competition and depressions. This notion is a grim joke to those who have witnessed the unremitting effort that goes into keeping some of the country's leading enterprises going.

An address by the head of a well known chain retailing organization at a meeting of the United State Chamber of Commerce reveals a few of the postwar headaches of retailers. Among other things he touched on the personnel problem of his company with the comment that "wartime conditions play havoc with the retailers, regular sales force. Enlistments and departures to war plant jobs were tremendous. In our company alone over 6.000 employers went into the Armed Services out of a total of 13,000.... The result was less and poorer service to our customers.

"Today we must rebuild our sales forces—with returning veteran employes and by training new and promising sales people. We must bring back, as soon as possible, the courteous and efficient service the public requires and is entitled to and which the retailer must give if he is to succeed in business."

Here is an established retailer, a retailer that the uniformed would assume held an entrenched position, and yet he spoke of what he must do if they wish to succeed he knows he must please consumers.Could there be any more reassuring evidence of the healthy competitive conditions existing in the distribution industry? Certainly such words belie the old-fashioned crepe hangers who think they hear the crack of doom whenever anyone mentions chain stores.

Question of Principle—Not Prices

When the government sets out to control prices, and supply and demand, the natural forces of the free market—it must reach ruthlessly into the lives of all people. There can be nothing democratic about it. The United States is trying to straddle the fence. It is trying to control "inflation" painlessly for as many people as possible with a strong show of democratic justice which may sound like good political strategy but which simply will not work. The corollary to price control is wage control Under the government's fence-straddling policy it has not been expedient to control wages. Such a step is unpopular with too many people. On the other hand, the OPA is a splinter of European dictatorship. It rules prices by decree, it sends people to jail, its spies sift through the affairs of thousands of businesses—and the private citizen is effectively barred from seeking relief from its decisions in the regular courts. If OPA is continued the principle it represents, government by unquestioned decree, must be broadened promptly. Wages too must be controlled, and strikes must be barred. The present half and half system—half free, half controlled, is leading to production demoralization.

In deciding the future of OPA, the first question to be answered is What kind of a system of government do we want in this country? This is a question of principle, not prices. By comparison, prices are irrelevant. Today no one can talk about prices with any certainty. Inflation may continue its course regardless of the system of government we decide to follow. The point is that we must choose a form of government and stick with it, of face anarchy. If the decision is in favor of the traditional American government of checks and balance under which coercion by decree is prohibited, the OPA and the authoritarian principle it represents must be abandoned. If prices go through the roof during the readjustment to the free market, the country will have to grin and bear it with the knowledge that the path of freedom is sometimes hard, although in the end its rewards are worth the sacrifice—something that Americans have known since 1776.

What Is the Difference?

The Surplus Property Administration has recommended that "Big Inch" and "Little Inch" pipelines be operated by the government as oil carriers. Oil men are opposed to such a move and point to studies made for the Reconstruction Finance Corporation by an engineering concern which concluded with the suggestion that the lines be used as natural gas carriers. The report stated that continued use of the lines for oil would: (1) disrupt the existing distribution system of the industry; (2) prove inefficient due to lack of sufficient oil supplies at present terminals; (3) prove harmful to national defense requirements for overland distribution because ruinous competition would be engendered.

Representatives of the oil industry are asking whether the pipelines are to become another "Muscle Shoals." The government's Muscle Shoals nitrate plant of the last war was the starting point of the present nationwide electric power socialization program. Must oil now follow electric power as a sacrifice to expanding government? Oil industry spokesmen say that, "It is inconceivable how a government agency charged with a responsibility and vested with an authority of such magnitude as the Surplus Property Administration and operating under a mandate of Congress which demands preservation of the free enterprise system, could even suggest a course so utterly antagonistic to our way of life."

Of course there is no reason why, if the socialization of electric power receives public sanction, oil should not follow. And if that is done, is there any reason why all other industry should not be treated in like manner? How about the barber who raises the price of haircuts to a dollar or more if they wish? Why not let government cut hair "at cost?" Private enterprise in oil or power is not one bit different than private enterprise in the barber shops.

Tomorrow May Be too Late

Those who own their own homes in this period of inflated values and housing shortage, are very fortunate. But a large percentage of them have become overly complacent. They own their homes, yes. Yet they neglect to adequately protect themselves in case of fire. The fire insurance industry is making a concerted effort to impress upon all home owners that fire insurance policies should be checked periodically to see if they reflect current values. In the last few years property values have risen 30 to 60 per cent of more A home that was fully insured ten years ago is probably not much more than half insured today. If it is destroyed by fire, the owner would awaken to the sickening realization that replacements on the strength of his outdated insurance would be impossible.

So don't procrastinate. Appraise your insurance policies immediately. Don't jeopardize the most important element of security for yourself and your family—your home.

People buy insurance for protection. Fire insurance companies would be subject to criticism if they did not warn the public when inflation undermines that protection.

Negro College Fund Drive Is Launched At Notable Meeting

New York, Brigadier General George A. Harkan, commanding general, Camp Lee, Virginia, called upon the Nation to "build our mindpower to win the peace just as we overcame manpower shortages to win the war."

He addressed 300 national leaders in business and education Wednesday afternoon, April 17, at a meeting launching the third annual campaign of the United Negro College Fund, held in the Rainbow Room of Radio City. The Fund seeks $,300,000 with which to aid the 333 affiliated Negro private colleges.

General Horkan appeared on a brief program that also heard Edwin Embree, president of the Julius Rosenwald Fund; David D. Jones, president of Bennett College, Greensboro, N. C.; William E. Cotter, counsel for Union Carbido and Carbon Corp., and chairman of the Greater New York Committee for the Fund; and William W. Pierce, an ex-serviceman now attending Hampton Institute in Virginia. Frank M. Totten, vice president of the Chase National Bank and national campaign chairman for the 1946 appeal presided.

Miss Dorothy Maynor, celebrated soprano, highlighted the musical portion of the program. Miss Gladys Childress, young Negro concert pianist, also appeared as soloist with the Sperry Orchestra under the direction of Norman Pickering.

General Horkan, a native of Georgia, was successful in building morale among Negro soldiers who were trained for the Army Service Forces at Camp Lee.

General Horkan said that "to educational institutions must go high honors for the men trained and welded into a fighting machine such as our army. They were not trained for war by education or imbued with a spirit of conflict by tradition. But in springing to the defense of our institutions and traditions in a time of crisis, they demonstrated the results of education in a liberty-loving country."

The general declared that "as we make our way to peace, new frontiers of the mind must be reached. We have won the fighting war, but the breeders of conflict and misunderstanding, intolerance, greed, ignorance and complacency, are still enemies to be conquered. Education is our most powerful weapon for their defeat."

Dr. Jones said that the Fund, of which the institution he heads is a member, "Is the bright ray of hope for our colleges. In 1943 the member institutions, by their individual efforts, raised a total of approximately $400,000. The next year, in their first attempt at a united appeal, they raised more than twice that sum. Last year, they collected $1,069,000."

He explained that in the decade ending with 1943 "income from sources other than tuition declined alarmingly. Large gifts from philanthropists, which once were the mainstay of many of the colleges, had fallen off. Income from endowments, never a large factor in most instances, also dropped."

Describing the Fund as "an instrument of national unity," Dr. Jones said it has become 'a focal point around which North and South, black and white, Protestant, Catholic and Jew, can all rally to demonstrate the determination that here in America the equality of opportunity which we have talked about so long shall become a reality."

Speaking for the Greater New York Committee which has a quota of $278,000, Mr. Cotter told the group that although he had participated in many fund-raising campaigns in the past, "none of them exceeded in importance the one I have now undertaken." Mr. Cotter was chairman for Greater New York during the Victory Loan drive..

"If the task before us can be successful," he declared, "and if the cause of education, not just for Negroes, but for all Americans and for all peoples, can be carried out, we will have dealt a decisive blow to the enemies of peace who by their pernicious machin-actions for world conquest made war-bond selling a necessary condition to victory."

Less than a week after D-day in France, Mr. Pierce's "luck gave out" when the truck in which he, a staff sergeant, was rushing supplies to the front hit a land mine. He spent seven months in an Army hospital. His story, however, related to his realization while overseas that "with change came new responsibilities and problems in living and citizenship," and his determination to get an education in order to "help these less fortunate and create a consolidated understanding between men."

He discussed briefly his effort at adjustment at Hampton Institute, where he enrolled last September, and the help he had received from the institution and fellow students.

The 1946 appeal of the Fund is a nation-wide campaign, but is being focused upon more than 50 major cities in the north and south. It is being spurred by a national advisory committee of which John D. Rockeleffer, Jr., is chairman. The vice chairman for the drive are: Nathan Adams, Dallas; Col. B. O. Davis, Jr., Columbus; Harvey S. Firestone, Jr. Akron; Mrs. Maurice T. Moore, New York; William Jay Schieffelin, New York; Edgar B. Stern, New Orleans.

Easy Way Protect Corn From Weevils

Corn weevils may eat as much corn in Alabama as livestock and poultry combined, report county agents in most areas of the state.

They further state that this is the proper time of the year to kill weevils in corn. Clean out the crib and disinfect with a strong solution of boiling hot lye water before corn is placed in crib.

If the crib isn't tight, line the walls and floors with old cardboard or better still building paper. A crib must be reasonably tight for successful treatment with high life or carbondisulphide, the latter being the chemical name.

After the corn is in the crib, secure a number of pie plates or other shallow containers. Buy 1 gallon commercial carbondisulphide for each 1000 cubic feet space in crib. Pour this material into the plates or containers and *close the crib.*

Do not go near the building with any kind of fire or lighted cigarette, cigar or pipe. *This material is highly explosive* and is very, very dangerous in the presence of fire. Keep the crib closed 48 hours.Open up and air out before entering. Livestock should be removed from near the building during treatment.

Two such treatments—one when corn is all in and another in about 3 months should control weevils in a reasonably tight crib.

Activities of Negro Agricultural Extension Agents

By A. S. Bacon, Asst. Supervisor —Negro Work

In facing the fact that farmers are entering into one of the most critical periods in the history of American agriculture. Negro county Agents have been busy this month holding community, county wide meetings and method demonstrations, the Georgia Agricultural Extension Service headquarters located at Georgia State college, reported recently. The purpose of the meetings have been to acquaint the neighborhood group leader with many new methods of attack and solution to the many situations facing the Negro farmers of the state. Some of the problems that were discussed were: raising the levels of living and welfare for rural people, production of sufficient food and feed or maintaining the people and livestock on the land, conserving our natural resources, and increasing the efficiency of production Most of these meetings were attended by some members of the state personnel staff located at the Georgia State College, and some were attended by Extension Specialist from the Athens' office, Savannah Office reported.

These meetings were attended by a total of 5,412 Negro farmers and farm women.

Labor Union Wins $10,000 Damage Suit Against W. Winchell

NEW YORK, April 20.—Joseph Curran, President of the National Maritime Union, announced today that a check for $10,000 was received this week from the Hearst Corporation, thus climaxing a six-year court fight by the Union against Walter Winchell, the Hearst press and the Andrew Jergens Company for statements defaming the NMU and its members.

The Union said that the Hearst check brings the total damages won by the Union in this libel action to $19,000. It stated that its suit was the first ever filed and won by an American trade union against a broadcaster and columnist.

Last June, the Jergens Company, which sponsors Winchell's broadcasts, settled for $9,000 and the Union used hose funds to establish schools to train its members for leadership. The $19,000 is the largest sum ever collected by a trade union which had sued for libel in this country. The settlements were negotiated by William L. Standard, general counsel of the National Maritime Union.

The case had appeared on the Supreme Court calendar for trial several times. Mr. Curran said, adding:

"Although Winchell frequently says that there are hundreds and thousands of people who sue him for libel but never appear in court, this time Winchell, in order not to appear for trial, agreed to settle the law suit along with the Daily Mirror, and paid $10,000 to the Union."

Union Nails Sabotage Charge

The Union's action was brought in the New York Supreme Court on July 3, 1940, in the name of Joseph Curran, as President of the National Maritime Union. The suit was filed following a broadcast by Winchell on June 9, 1940 and subsequent publication in the New York Daily Mirror of baseless allegations that the NMU and its members were engaged in subversive fifth column activit eiasdu sive fifth column activities and were actively conspiring and engaging in the sabotaging of American vessels.

Basic Question Unanswered

During Congressional hearings on the nomination of Julius A. Krug for appointment as Sect., of the Interior, Federal hydroelectric power development was discussed. Mr Krug said, "I am a firm believer on public power, because I think in many cases it can provide power cheaper than the private operation." In such cases, Mr. Krug, who is now the Sect., of the Interior believes that "adjustments with privately owned facilities can be worked out in such a way that the private investment is not destroyed."

Altogether the new Sect., of the Interior appears to be taking a constructive attitude on the power question. But there are points that need clarification. In measuring the comparative efficiency of public and private ventures, the practice has been not to make any material allowance for the heavy taxes paid by private companies as contrasted to the virtually tax-free government plants. Private companies pay on the average about 20 cents out of every dollar of revenue to government in taxes.

Also, Federal power projects, regardless of polite phrases to the contrary, will always be subject to centralized political authority. Private power companies, on the other hand, are locally regulated. Electric consumers at any time may protest to the utility commission if they are dissatisfied, and get a ready hearing. The commission is a public body. Its interest is the public. But it has no jurisdiction over the rates of Bonnevilles or TVA's—they are laws unto themselves and do not recognize local regulatory authorities.

And one other fundamental point not touched upon by Mr. Krug, is just why the Federal government should go into a tax-exempt power business simply on the promise that it can produce power cheaper than a heavily-taxed private campany. On the same theory, there is hardly an industry in the country for which a case could not be made for public ownership—until the point was reached where there was no private enterprise felt to pay taxes to finance public business. After that the "economies" of public operation would disappear and the people would find themselves living under a socialistic form of government.

Negro Colleges Not Aiding War Against Race Prejudice, Says

ATLANTA, Ga., April 18.—Special.—Negro institutions have done little to lessen racial prejudice by education, Dr. L. D. Reddick, curator of the Schomburg Collection at the New York Public Library, told an audience Wednesday evening at a forum at Atlanta University. Following this challenging statement the speaker declared that not one of the Negro colleges has produced a readable American history textbook which is available to all people. He further stated that Negro schools should be more sensitive to the problem and offer corrective measures.

Dr. Reddick told his listeners that American education is actually increasing instead of decreasing race prejudice, placing the blame squarely on the textbooks and the teachers. The textbooks used in American schools, he said, are just about as bad in the North as in the South. Very little is found in them concerning the slavery revolts and the underground railroads which depicted the Negro's struggle for freedom although practically all contain sterotypes of the race which are only partially true.

In discussing the period of the Reconstruction, which practically all textbooks refer to as a carnival of ignorance and thievery, the speaker criticized historians for failing to mention the constructive program of the black Southern legislators which included a revision of the penal codes and the state constitutions, the introduction of social legislation, and the extending of the ballot to two groups.

As a solution to the problem, Dr. Reddick suggested: (1) that there should be an awareness of the process of education; (2) that institutions interested in decreasing race prejudice should attempt to select more democratic textbooks and collateral reading material; (3) the introduction of scientific corrective courses in the history of minority peoples; and (4) for teachers to be more critical in regard to school books and in turn, help students to have a critical attitude in evaluating the materials. He believes that there is wide freedom in many schools not being used and that many of the racial distinctions could be corrected with the proper pressure techniques.

25,000,000 Pounds Of Eggs Sought For Foreign Nations

Memphis, Tenn.—(IP)—The federal government is prepared to buy as much as 25,000,000 pounds of eggs to feed foreign nations faced with starvation. U. S. Department of Agriculture representatives told Southern Extension Service poultry specialists here today.

The government hopes to establish a price floor by requiring egg dealers selling to the government to pay producers an average of 27 cents a dozen for eggs weighing 44 pounds per case. H. L. Miller, of the department's Extension Service, told the closing session of a two day meeting.

CME General Conference To Elect 3 Bishops At Session In St. Louis

St. Louis, Mo.—Five hundred delegates and alternates, augmented by a thousand or more visitors, are expected in St. Louis on Wednesday. May 1, when the 20th Quadrennial General Conference of the Colored Methodist Episcopal (CME) Church will open at 3924 Finney Avenue.

The church has eight living bishops, all of whom are expected to be present. They are: Bishop C. H. Phillips, senior prelate of the Church: Bishop R. A. Carter, the entertaining bishop; Bishop J. Arthur Hamlett, Bishop H. P. Porter, Bishop Jno. H. Moore, Bishop J. W. McKinney, (retired); Bishop W. Y. Bell and Bishop Charles L. Russell.

Mrs. Rosa T. Hollis, president of the Women's Connectional Council will preside over the meetings of that Body, assisted by Mrs. Eula F. Harris.

According to Rev. J. C. Colclough, capable reporter of the C. M. E. activities. St. Louis is the ideal meeting place for the General Conference, because of its popularity with aspiring candidates for bishopric and other official positions, also because of its central location. Rev. Colclough points out that in 1914, Drs. R. A. Carter and L. C Cleaves were both elected at the St Louis session: in 1932, Drs. R. T. Brown, J. C. Martin, J. Arthur Hamlett and Jno. W. McKinney were elected; and in 1934, St Louis saw the elevation to the bishopric of Drs. H. P. Porter, J. A. Bray and Jno. H.. Moore. Of the twenty one bishops the Connection has had in its more than 80 years of existence, nine were elected in the Missouri Metropolis, it is pointed out.

The CME's boast of several splendid schools, including Lane College at Jackson, Tenn.; Paine College, Augusta, Ga.; Texas College, Tyler, Texas; Miles Memorial College, Birmingham; and Mississippi Industrial College at Holly Springs, Mississippi.

Among the distinguished men holding high office in the Connection are: Dr. Luther Stewart, editor CHRISTIAN INDEX; Dr. W. J. G. McLin, editor WESTERN INDEX; Dr. W. P. Pipkins, Book Agent; Dr. L. C. Jones, editor EASTERN INDEX, Prof. G. F. Porter, Financial Secretary; Dr. Felix L. Lewis, General Secretary, Kingdom Extension; Dr. B. Julian Smith, General Secretary Religious Education; Dr. G. C. Chapman, Secretary Public Relations; Dr. C. S. Martin, Superintendent Connectional Hospital (Memphis); and Dr. C. A. Kerkenndall, Director Leadership Training.

It is understood three bishops will be chosen at the conference. Many of the ablest ministers and educators are expected to contest for these high positions. Among those prominently mentioned are Dr. Luther Stweart, editor of the CHRISTIAN INDEX and Dr. Bertram W. Doyle, former Secretary of Religious Education, but now President of the Municipal College in Louisville.

Among laymen prominently mentioned for high honors is Editor I. Willis Cole, of the LOUISVILLE LEADER and one of the pillars in the Chestnut Street C. M. E. church of Louisville.

AN INSPIRING DAY

(Continued From Page 1)

foothold on the land in that State. The same thing is true in a greater or lesser degree in all the Southern States from Maryland to Texas.

I maintain that this points the way to a solution of many of the problems of southern agriculture for black and white alike. Our job is to get as many Negro farmers as possible in the same competitive position as the Collins family. This takes land, capital and some guidance in management. It takes a financial arrangement whereby a loan can be amortized over a period of years out of the normal expected income from the farm under good management but which also provides a means by which the farmer can take advantage of good years to keep from being "snowed under" by catastrophes and bad years. FSA's variable payment plan does this. It should be adopted by banks and other farm financing agencies.

Unless a farmer or a prospective farmer is in position to have this general competitive outlook and unless he has the proper family and health requirements and general ability, he had best forget about farming and go into such other occupation as the opportunity presents. It will be better for him, his family and for the families which remain in farming if this occurs.

The outlook for Negroes in the future of Southern Agriculture will depend on how many are able to acquire the necessary land, capital and financial arrangement, and the necessary educational guidance to compete in an increasingly competitive agriculture. THIS IS THE JOB OF NEGRO AGRICULTURAL LEADERSHIP.

When we ponder up the number of our farm families which have inadequate resources, which are suffering the insecurity of a rotten tenance system and which are destined to be displaced by mechanization, we are likely to become overly discouraged and sink into the morbidity of a "nothing can be done" attitude. Experiences like the meeting with the Collins family, on the other hand, give one a lift and the inspiration to keep on trying. It was a great day.

Negroes Succeed In Georgia

Georgia Negro 4 H Boys and Girls Lead the Nation. Negro Agricultural Extension Service Pioneer in Raising and Exhibiting Fat Beef Cattle. Alabama, Mississippi, Texas and South Carolina Follow Georgia's Progressive Leadership in Educating Folk to Live in the Big Out of Doors. Negroes Need More Common Sense Leadership.

By BENJAMIN F. HUBERT

A Middle Georgia County Superintendent of schools in speaking of the recent beef cattle show held by colored boys in the streets of that county seat said: "Much of the worthwhile education today is being done on the outside of the classroom. When a boy raises and fattens a purebred beef calf for a discriminating market, he has learned many of the fundamental lessons leading to success in life. When he has learned to understand, be kind and considerate to animals, this becomes very worthwhile education in helping him to find success in working with human beings." This Superintendent is thinking realistically and constructively in a way to build a "Better Georgia."

Georgia should take keen pride, in the universally acknowledged fact that Georgia Agricultural Extension Service for colored people leads the nation. Director P. H. Stone and other leaders have demonstrated remarkable vision and foresight, and much courage in developing a meaningful and realistic program of practical education for farm black boys and girls. In this and many other fundamentally sound progressive programs for the improvement of farm opportunities for black folk Georgia has led the nation. Georgia is setting the pace in sensible education for farm people, and other states seem glad to follow our leadership. What is being done is stimulative, informative and inspiring education that everyone—white and black—can understand and appreciate.

GEORGIA NEGRO FARM BOYS AT WORK

Negro 4-H boys and girls are really popularizing farming among colored people. By raising and fattening out prize beef cattle for shows and sales, participated in by both white and black folks in all parts of Georgia, these boys and girls are selling not only fine beef calves that will provide lovely steaks and roasts for the family table, but they are also selling black folks to white folks.

Starting out here at Georgia State College in the early nineteen thirties with the first beef cattle sale in Savannah, the whole program of beef cattle education has been deepened and expanded in Georgia until now we have beef cattle shows and sales in practically every important farming center in the State.

1. In Macon, early in April, William Harris of Bibb County sold the championship calf of the show, which included calves from many surrounding counties, for 51c per pound. The total receipts for his calf, including prizes amounted to $444.35. Other boys in this show received an average of 31c per pound for their calves.

2. In Albany, Sanders Newsome of Daugherty County led all of the adjoining counties in the show and sale with a calf that was admired by everyone.

3. In LaGrange, Ellie Andrews of Troupe County captured the honors for that section of the State.

4. At Sparta, twenty five calves were exhibited; nearly $150 were distributed in prizes by the local business leaders. Nathaniel Dixon of Hancock County won the $40 first prize. This same boy has 25 acres of the finest wheat in Georgia.

5. At Augusta at the Twin States spring beef cattle sale, Nathaniel Dixon led all competitors from East Georgia counties. This marks the sixth year that highest honors have gone to Dixon. He had two steers bred and raised on his farm. He was awarded both the first and sixth prizes. Log Cabin Center in Hancock County is the place where colored people in Georgia began first to raise and market purebred pedigreed beef cattle. Dixon was stimulated and inspired by Log Cabin leadership.

6. On April 26 colored boys and girls of Screven County will exhibit and sell cattle at Sylvania.

7. At Millen on April colored people of Jenkins County will have a calf sale.

8. At Statesboro, on May 2 Bulloch County 4 H boys and girls will offer the public a chance to buy their cattle.

Negroes at Valdosta and Southwest Georgia recently staged their first cattle show and sale—one of the finest in the Southeast. Here the calves were raised and made ready for sale by vocational agricultural boys. But these boys are following the dynamic leadership of the 4 H boys under the direct supervision of P. H. Stone and Alexander Hurse. 4 H boys are helping to educate NFA boys. But the big job of education is being done! In 1947 it is on the Agricultural Extension agenda to have cattle shows and sales in every populous farm center in Georgia where black boys and girls may exhibit the fruits of their labor for their own profit and for others to see and enjoy.

NEGROES NEED REALISTIC LEADERSHIP

Gordon B. Hancock of Richmond, Virginia in a recent release for the Associated Press says, "From the first I have only been supremely interested in the precarious economic structure of Negro life. The precariousness of this structure is by no means removed. No answers have yet been found for the fundamental questions propounded 20 years ago, namely, what are we going to do when the lowly white man takes over jobs made by the white man and for the white man? I have accordingly advocated a deeper interest in technical education. But to date the Negro interest in this type of education has been rather casual and in far too many cases downright indiffcrent or hostile." . . . "Negro leadership has nowhere fallen down so completely as in this area. Because it was unpopular to champion industrial and technical training, Negro leaders have "played safe" and omitted serious references to this area of industrial relations."

The farms properly managed and supervised offer unlimited opportunities—farms offer jobs that can not easily be taken from us. Our leadership must not lose sight of technical, industrial and agricultural education. These fields of industry offer ever expanding opportunity for our people. The Agricultural Extension Service in Georgia, devoted to the interests of black folks living on the land, furnishes a sensible leadership that thinking people everywhere admire and have demonstrated a willingness to follow. Unquestionably there is increasing need for a leadership that can exhibit a growing understanding of the problems facing black folks and is quick to provide a tangible expression of ability to go forward in the right direction. The ability to produce purebred beef cattle for a critical market is a step in the right direction. Negroes in Georgia should continue to diversify their farm program, assuring challenging opportunity for young folks who live on the farm.

Colored Victory

(Continued From Page 1)

doing all they can to produce more food for themselves. The United States is sending them large quantities of vegetable seed to help assure increased supplies when the crops mature. For every eight pounds of seed planted here, one pound is shipped abroad. It is expected that 30 million pounds of vegetable seed will be sent this year to 37 countries. Department experts say that on an average, a pound of seed will produce about a thousand pounds of food.

In the meantime, the home gardens grown by the American people will enable our Government to ship more food abroad. Department nutritionists say that fresh vegetables from the garden will help families cut down on bread and cereals, and it is pointed out that gardening is fine exercise for city people.

Offers Program

(Continued From Page 1)

MISSISSIPPI EXPERIMENT

In the Mississippi Delta, where about one half of the population is colored, complete mechanization of cotton production with the help of a mechanical picker has experimentally reduced the labor required to one fifth of what is necessary with mule power and hand methods, the report states.

Industrialization of the South, it is believed would afford colored persons opportunities to expand in various service trades such as gasoline distribution, local transport, amusement, cleaning and dyeing and the hotel and restaurant field.

Poor Meal Planning

(Continued From Page 1)

vegetables as well as to help make more food available for the starving peoples abroad, youngsters plan to grow school gardens again this year, according to reports. And there are indications that more families will grow gardens this year than during the war. This not only will ensure them a better balanced diet, but also will enable America to contribute more to foreign relief.

Those without home gardens can help by eating foods in plentiful supply in place of shippable foods which may be sent abroad, Department officials say. They can help also by cutting down on the use of wheat products such as bread, macaroni, spaghetti, and fats and oils.

Farmers To Cultivate More Acres This Year

Final goals to guide the production efforts of farmers through 1946, announced by the U. S. Department of Agriculture, call for more than 296 million acres in cultivated crops. This represents an increase of some nine million acres over the indicated acreage actually cultivated last year.

Increases are asked in acreages planted to wheat, cotton, corn, and small grains, while adjustments downward have been made in goals for potatoes, burley and dark air-cured tobacco. An increase is asked in acreages of tame hay and cover crops.

Peacetime adjustments are reflected in recommended milk and poultry products. A revision downward is urged for each, while increases are sought in the number of pigs farrowed and saved.

FARM INCOME HIGHER

The net U. S. agricultural income increased from an annual average of about six billion dollars in 1935-39 to almost 15 billion dollars in 1944. Prices of farm land have advanced about 57 per cent.

All Of Us

AMERICAN PRESS ASSOCIATES Room 905 112 E. 19 St., New York 3, N Y Algonquin 4-4955

By Edwin R. Embree, President Julius Rosenwald Fund

Note to readers:

Edwin R Embree, who is Chairman of the Mayor's Committee on Race Relations in Chicago, is a native of Kentucky (born while his parents were temporarily absent from the State!) He grew up in the household of his abolitionist grandfather, John G Fee, who had founded before the Civil War and maintained in spite of mobs, a "co educational" college for white and colored pupils.

He is the author of a number of books largely on social and racial matters, the latest of which are **Brown Americans**, and **13 Against the Odds**, biographies of 13 distinguished Negroes.

NO. 11 January 29, 1946

OUR GUEST COLUMN

When a Japanese American was brought into a Chicago office, a Negro stenographer sneered, "I'll not work with any yellowbelly," and stalked out; haughty as any Nordic. Cults of Negroes in many cities gleefully engage in anti-Semetism. At the same time Jewish businessmen all too frequently exploit Negroes, and Jewish families along with their Gentile neighbors give support to the same kind of ghetto walls in America that they fled from in Europe. Catholics often show the very same intolerance to other Christians that they complain of when it is directed against them. Polish Catholics led by their priests fought Negro admission to the homes built for them by the Federal government in Detroit. In California, Negroes, Mexicans have vied in looking down on one another.

All of this is crazy.

A Negro fascist is just as ugly as a white fascist. Intolerance is just as evil in a Catholic as in a Baptist. We are not going to get democracy in America so long as each group strives for special advantages for itself.

We are not going to break the tough walls of segregation and discrimination unless all groups unite in behaf of full participation to all phases of American life by all the people.

Liberals have lost their battles, time out of mind, because we fought among ourselves rather than against the common Enemy. All of us in America—Negroes, whites, Jews, Japanese Americans, Catholics, Protestants, all of us—can build a society of freedom and security if we stand together. If any of us suffer, we all suffer.

This idea was put forcibly and beautifully by John Dunne three hundred years ago. With a slight omendation of mine, one of his great poems ends:

No man is an island, entire of itself.
Each is a piece of continent, a part of the main.
If the bell tolls the knell of any man (or any group of men),
Never send to know for whom the bell tolls;
It tolls for thee."

PLAN NOW

To replenish that wood pile that melted with the snow before another cold spell.

To cull laying hens heavy this spring; eggs will be cheaper but feed will be just as expensive.

To be ready to do some gardening in February; have seed ready.

To rub hand over each cows back at least once each week. If you feel lumps treat them for cattle grubs.

To help your neighbor in the coming Red Cross drive.

THE COLLINS review their Farm Family Record Book in which they keep an accurate record of farm income and expenditures for the year. Tamo community, Jefferson county, Arkansas. March 27, 1946.

Price of Hogs Expected To Hold '45 Levels

Hog prices for the first quarter of this year probably will average about as high as the early months of last year, when they were at the ceiling level most of the time, according to studies compiled by the U. S. Department of Agriculture.

During the first three or four months of this year there will be available about as many hogs as a year ago, the report says. But economists indicate that when last fall's pig crop comes to market in the late spring and summer, slaughter numbers probably will run larger than last year.

A greater pig crop than was marketed last year is said to be in prospect if farmers carry out their intentions for spring farrowing, and if they save as many pigs per litter as usual. Special emphasis is being laid upon best handling of litters, so that losses from all causes will be curtailed.

The Last Straw

Before the last coal mine strike, a coal company issued the following statement: "--Four hundred thousand men directly employed in the coal mines are going to quit work, in spite of an offer of an additional wage increase of 18½ cents an hour. They will lose as a result of this strike approximately five million dollars per day.

"These miners, by striking, will reduce the supply of all goods and merchandise for themselves and the public, since manufacturers engaged in making goods are largely dependent upon coal for fuel, power or transportation. The effort of this shortage will continue for many weeks after the miners go back to work. Millions of workers in manufacturing, transportation, and distribution industries will lose working time and wages as a result of this coal strike. The cumulative cost to America will probably be greater than the amount of the requested. British loan of three billion seven hundred million dollars." The strike weapon as it is being applied today, is actually threatening the survival of the nation. Whole industries are brought to a dead standstill at the command of a few men. Countless thousands of persons willing and ready to work, persons who have never had any trouble with the individual company where they are employed, are denied the right to work and ordered off the job. The effects of this gigantic labor monopoly are hitting at the heart of our country industrial production. High production is needed now, critically. We are not getting it—thanks to strikes. The action of the coal miners may be the straw that will break the camel's back— a patient public.

The fault for the present situation lies directly at the door of government. It is an outgrowth of the NRA, the Wagner Act, and the Morris-LaGuardia Act which exempts labor unions from the anti-trust law. As a result of these acts, labor leaders are completely beyond the law in their organizing and strike activities. They have the power to overide government. In fact, the government is apparently afraid to take the mines over in the present strike because of the fear that Mr. Lewis will defy it as well as the coal industry.

The longer the delay in correcting our one-sided labor laws, the harder it will be to correct monopolistic labor practice that are bringing the country to its knees.

United States Dept. Of Agriculture

Famine Emergency Committee
Washington, March 25, 1946
Summary of remarks by Chester C. Davis to the National Garden Conference
(For March 26, p. m. Release)

Victory Gardens this year will save lives, Chester C. Davis told the National Garden Conference meeting at the Department of Agriculture in Washingon today.

The chairman of the President's Famine Emergency Committee said to the garden leaders, "Victory gardens will make it possible to conserve more food and produce more food in 1946. The more gardens we have and the better gardens they are, the more food we can send abroad and the more lives we can save."

Mr. Davis said, the people in the famine stricken nations were exerting every effort to get back into full scale food production, but they have many difficulties to overcome. He pointed out that the United States was exporting large quantities of vegetable seeds to help these countries grow their own food. "For every eight pounds of vegetable seed that we plant," he said, "one pound is being sent abroad. All told, the U. S. will ship about 30 million pounds of vegetable seeds to 37 different nations this year. On an average, a pound of seed sent abroad will produce about a thousand pounds of food."

The most critical need during the next few months was said by the FEC chairman to be that of accumulating enough wheat, fats, and oils to meet the goals set for exports in the first half of 1946. Citing such factors as the shortage of tinplate and record breaking consumer demand, he said that general and localized shortages of other foods might develop from time to time.

"All these facts," said Mr. Davis, "show the need for millions of gardens in 1946. Gardens will help us conserve wheat by providing extra vegetables to make up for less bread and cereal. They will cushion against shortages which may develop here and there during the critical months. They will enable many more people to can and preserve foods, making it possible for them to donate more to collection campaigns for foreign relief. Gardens will, in short, help us meet our goals for export and protect us against shortages at home."

Exercise Held At

(Continued From Page 1)

agement Supervisor for PSA in Jefferson County interviewed Mr. and Mrs. Collins over the Pine Bluff radio station. The Collins family has nine members—mother, father, four sons, and three daughters. They were selected from approximately 3,000 Negro families who secured loans from the FSA in Arkansas.

The selection of the family was based on the following standards:

1. Must have been on FSA program for at least one year.
2. Must be current on obligations.
3. Must have kept record to substantiate progress made.
4. Major income must have been derived from the farm.
5. Evidence of good farm management by:
   a. Diversification.
   b. Soil conversation.
   c. Food and feed production records.
   d. Pasture improvement.
   e. Tenure improvement.
6. Evidence of good home management by:
   a. Live at home practices.
   b. House clean and attractive.
   c. Premises clean and beautified.
7. Maintenance of buildings.
8. Gain in net worth.
9. Wise use of income.
10. Progress made with FSA help.
11. Participation in community affairs.
12. Children kept in school.
13. Handicaps surmounted.

They purchased their 60 acre farm in 1939, planted 26 acres of vetch, 12 acres of corn and peas, cotton, interplanting 20 acres with 7 acres of lespedeza, 2 scores of soybeans, one acre of sweet potatoes, 2 acres of garden, and 8 acres of pasture Their harvest last year totaled 37 bales of cotton at $4,000; 400 bales of hay at $196; 461 bushels of corn at $225; $50 from potatoes: $167 from cattle, hogs and poultry.

The family canned 900 quarts of fruits and vegetables, and killed one beef and four hogs. Their 3 cows produced a surplus of milk and butter. The 75 hens supplied eggs and meat. Food grown and conserved was estimated at $916, while only $192 was spent for staples during the year.

They paid $1,089 on their $4,700 farm ownerhip loan this year, leaving an indebtedness of $1,978.

VEOLA COLLINS attends to the feeding of the poultry on their FSA farm in the Tamo community, Jefferson county. March 27, 1946.

USDA Suggests Ways Homemakers Can Save To Fight Famine Abroad

Washington, D. C., April 8, 1846

Starvation can be staved off in India, Europe, and parts of Africa by the white and colored home makers of America, if they will cut down on waste and use plentiful foods in place of wheat, fats and oils which are needed most by the starving masses overeas, say nutritionists of the U. S. Department of Agriculture.

USDA nutritionists have listed several suggestions by which home makers may help save food in a leaflet entitled, "How Homemaker Can Help Save Food to Fight Famine" Pointing out that the President's Famine Emergency Committee has called on householders to reduce their purchases of wheat products by 40 percent and fats by 20 percent, the authors of the leaflet suggest the alternate use of potatoes, oatmeal, barley, and buckwheat for wheat and rice and list 11 ways of saving wheat and 11 ways of saving fats and oils.

The publication says, for example, that if the American people would discontinue wasting five per cent of their bread or one slice of every loaf of bread baked every day, the savings would be enough to feed a million people in the devastated countries for six months. And by subtituting a serving of oatmeal for two slices of bread once a week, the American people could send 135,000 tons of wheat to starving peoples abroad in four months.

Among the other suggestions for conserving wheat, fats and oils are: (1) Reach for a potato instead of bread—one small potato is the nutritional equivalent of a slice of bread and some vitamin C besides, (2) let potatoes replace wheat cereal, (3) top meat pies and other baked dishes with fluffy mashed potatoes instead of pastry crust. (4) make pancakes using fresh grated potatoes to replace a large part of the flour. (5) Use leftover cooked oatmeal as a thickening for gravies, soups and stews, (6) use cooked or dry oatmeal as a binder in meat foal, in place of bread crumbs, (7) use leftover cornbread in stuffings. (8) use potatoes, or hominy grits wherever possible in place of rice, and (9) avoid throwing rice at weddings for the duration.

The publication points out that bread can be saved by keeping it fresh, by letting the family ask for the second slice, by turning odds and ends of bread into dry crumbs for coating, topping and stuffing, by watching the toast so that it does not burn, and by making open faced sandwiches. The leaflet also advises homemakers that flour-hoarding will result in spoilage and loss, with weevils getting the only use of it.

Methods listed for conserving fats and oils are to buy table and cooking fat only as needed, bake and broil fish instead of frying, serve home made boiled salad dressing, collect drippings, and salvage and sterilize fat from plate waste.

Don't Be a Dunce

In sounding a warning against unwise speculation, the nation's leading stock brokerage firms, as well as the New York Exchange, have urged the public to be cautious. They point out that there are few individuals who have sufficient experience and knowledge to afford the inherent risk involved in speculation. The nation's largest stock brokerage firm urges individuals to establish funds for home ownership, education, and other forms of savings before entering the security market. The New York Stock Exchange, through advertising in many newspapers, has urged the public to not buy blindly but to deal through reputable firms who can advise the purchaser on securities of the type he should consider which are best suited to meet his particular requirements.

Nothing is easier to lose than money, and if the person who has saved will follow the foregoing sound advice, it will help maintain the stability of the country, check inflation, and prevent needless financial losses and many heartaches.

NEGRO INSURANCE WEEK WILL BEGIN APRIL 29

Local Agents Will Seek Increase of 'Million' In Risks

Managers and Staffs of Five Well Known Companies Expect to Make Banner Record in Production of New Business

One million dollars in new insurance is the goal set to be written on the lives of the Negroes of this city by the five big companies operating here in Nashville and middle Tennessee. The Nashville Insurance Managers Council made up of the members of these five companies has held regular meetings with their agents and Tennessee force and set their goal for this amount. Such well known companies as the Union Protective Assurance Company with headquarters in Memphis, Mr. W. W. Butler, district manager, of this city; The Atlanta Life, with home office in Atlanta, Ga., Mr. L. J Gunn, district manager; the Universal Life, with headquarters in Memphis, Mr. H. A. Gilliam, district manager; the North Carolina Mutual Life of Durham, N. C., Mr. F. B. Edwards, district manager, and the Supreme Liberty Life of Chicago, Mr. L. B. Hurt, district manager, make up the personnel of this local organization. The president of this local group is Mr. L. B. Hurt of the Supreme Liberty Life insurance Company.

These five managers, along with their officers and agency force have cleared the deck for action. They are holding pep meetings among themselves, they have instructed their agents who work with various deputies, on many kinds of insurance policy contracts. From their home office they have gotten the green light to go ahead, to make this the biggest Negro Insurance Week in the history of Negro Life Insurance solicitation. They in their effort will attempt to put Nashville before any other district, even challenging those of the home office groups and they are planning to hold a state-wide mass meeting, to have guest speakers, discuss insurance as an investment and protection and a savings in order that men and women might build a cushion, so to speak, for them to rest upon in after years.

It is barely possible, declared one of the men this week, that one of the presidents might be induced to come over here before the week closes, which begins May 10th and goes for ten days, to meet the Nashville public and to discuss the advantages of life insurance companies.

Each of the five has qualified under the insurance law of the state of Tennessee, which is said to be as strict as those of any other state, to do business anywhere in the Volunteer State and to write contracts for Old Line Legal Reserve Policies, Endowment Policies, Sick and Accident Policies for those who are physically able to pass the necessary medical examination to secure such protection. They will also present Educational Policies, where people might insure their own lives for the protection of their children, so that at its maturity the education of the child can be carried on, even after the death of the parent.

The agents working in the district will ring every door bell, contact every family, including the husband and wife, and offer them these advantages. The following is a list of the various insurance company managers, office force and solicitors:

Complete list of managerial staff and agency force of Union Protevtive Assurance Co. District office 331½ Charlotte Ave. Phone 6-2915.

Mr. W. W. Butler, district manager; Mr. H. K. Williams, Asst. Mgr; Mr. A. G. Love, Asst. Mgr.; Miss F. E. Barnes, cashier clerk; Miss Jeanetta Young, Asst. cashier clerk; Mrs. E. L. McCline, supervisor.

Debit Manager

Mrs. L. Avery, Mrs. V. L. Bass, Mrs. T. Beene, Mrs. G. E. Benton, Mr. A. Brown, Mrs. M. L. Cook, Mr. J. W. Fort, Mrs. W. M. Fort, Miss S. Peden, Mr. F. Pillow, Mrs. R. B. Swanson, Mr. W. P. Swanson, Mrs. E. Taylor, Mr. L. Ward, Mr. J. V. Williams, Mr. S. A. Owens, Jr., Mr. J. Sherrell, Mr. Z. Patrick.

Atlanta Life Insurance Company, Atlanta eGorgia:

S. M. White, supervisor.

A. L. Carden, Pulaski; R. L. Harris, Columbia; E. S. Greer, Shelbyville; G. M. Allen, Columbia; L. K. Gray, Winchester; L. Lucas, Mt. Pleasant.

W. H. Porter,

E. B. Gooden, O. H. Paige, M. Parker, C. C. Riggins, M. Jamison, G. O. Davis, all of Nashville.

C. H. Walton—

S. C. Farley, Nashville; J. H. Jordan, Nashville; A. Wright, Franklin; H. K. Evans, Franklin; D. Smith, Nashville; R. Claibrooks, Franklin; F. A. Booth, Nashville.

T. J. Wilson—

A. A. Stratton, Nashville: F. R. Williams, Murfreesboro; J. H. Rich, Nashville; D. D. Bryant, Nashville; M. S. Brown, Nashville; Miss D. V. Thompson, clerk; Mrs. I. L. Ridley, cashier; L. J. Gunn, district manager.

Universal Life Insurance Company:

H. A. Gilliam, Dist. Mgr.; C. N. Fields, cashier; J. J. Hill, secretary; S. L. Ferguson, Ord. Supv.; T. A. Adams, Asst. Mgr.; G. T. Harvell, Asst. Mgr.; E. Anderson, Asst. Mgr.; A. J Cole, supervisor; Wm. Hill, special Ord representative.

Agents

G. C. Howard, Sp.; C. L. Curtis, M. Syler. A. W. Walker, Robert Bomar, A. E. Berry, F. J. Puckett, A. M. Dotson, G. T. Haughes, J. B. Cantrell, C. W. Beasley, S. L. Word, L. O. Lloyd, M. P. Taylor, Thomas Holt, M. Scott, M. L. Herron, H. J. Sanders, L. R. Patton, J. Lay, M. L. Hill.

North Carolina Mutual Life Insurance Company of Durham, N. C. district office, Nashville. --- --- --

F. B. Edwards, Dist. Mgr.; Me. E. Proctor, Asst. Mgr.; E. Matthews, Asst. Mgr.; R. E. Hall, special Ord. agent; J. C. Shane, special Ord. agent.

Young Ex-Soldier Writes Powerful First Novel on Racial Tolerance

Mark Harris, whose first novel "Trumpet to the World," was published by Reynal & Hitchcock on April 1.

When Mark Harris, whose novel "Trumpet to the World" was published on April 1, was asked by his publisher to fill out the usual biographical form for the author's file, he answered "I am afraid I am too young to merit more than a paragraph of autobiography." Probably the most important event in this young man's twenty-one years was the acceptance by Reynal and Hitchcock of the manuscript he sent that house from an army hospital at Camp Wheeler, Georgia. The manuscript had been preceded by a letter dated April 2, 1944, which read in part:

"Thirteen months ago I entered the Army—enthusiastically resolved that whatever I was called upon to do, I would do—unhesitatingly, uncomplainingly, to the best of my ability. I pictured the Army then as a powerful, benevolent instrument,—a crusade, shoulder to shoulder, all colors, all creeds. . . Today I am completely disillusioned.

"In January, 1944, in an Army barracks within earshot of a lot of very unpleasant talk I began a book in which I attempted to show how segregation within the ranks was completely unnerving and disturbing to the thoughtful soldier. I tried to imagine myself a Negro soldier upon whom the burden of inequality within the ranks falls hardest. 'Trumpet to the World' is the story of a man born black in these United States and an enlightened white woman—the story of two Americans and their struggle for freedom in a land where freedom is a somewhat abused word. In part it was told me over poker hand and Coca-cola . . . by the surly, resentful, laughing, courageous Negroes whom I knew, who told what it is like to fight a two-front battle.—May I send you the manuscript?"

The answer from the publishers was an unequivocal "yes" and the manuscript was delivered in June. "Trumpet to the World," is a first novel that according to Alice Hackett, author of "Best Sellers of the Last Fifty Years," is as "controversial as 'Strange Fruit'—written with perception, deep feeling, excellent craftsmanship, and scenes of dramatic power."

Mark Harris was born in Mt. Vernon, New York, where he lived until he went into the Army in January, 1943. After his discharge thirteen months later he served as a reporter on a suburban New York paper, for a few months as a P. M. staff member, and since July, 1945 as a staff correspondent for the International News Service working out of St. Louis.

Mr. Harris confesses that "Trumpet to the World" whose title is taken from the third scene, first act of "Othello," is not his first book. At an extremely tender age he wrote a book of poems—"purely emotional"—and later a second book. Neither reached a publisher's office. In the years ahead he hopes to do much writing on progressive causes—particularly that of the Negro. He nourishes a secret desire to be in Congress one day.

When asked about his likes and dislikes, he thought awhile, then answered "I like people, all kinds—even some reactionaries, a lot of whom either can't help themselves or don't know the facts. Toward deliberately reactionary people I am murderous." His book is dedicated to Sergeant Norman Apell who with his entire company lost his life in France on August 29, 1944. Mr. Harris was married the day he received the first copy of his book.

OPA May Set Ceiling On Cotton Price

WASHINGTON, D. C.—A ceiling price of 24½c per pound on cotton is being considered by Chester Bowles, head of the Office of Price Administration. Cotton is the only major crop on which the price is not set by the government. Ceiling prices are in effect on wheat, corn, and livestock.

As might be expected, representatives of the big cotton planters in and out of Congress are saying that a ceiling price on cotton is "illegal, unfair, and unnecessary." Cotton senators and congressmen have notified Bowles that they will vote to abolish OPA if he dares to set a price on raw cotton.

It will be recalled that not a single voice was raised by these politicians from the South when a ceiling price was put on cotton pickers' wages last fall. No one but the Union raised a voice to call cotton picking wage ceilings illegal, unfair, and unnecessary.

Many of us remember what happened right after the first world war when price controls were dropped by the government. Cotton went sky high. Down in the Delta, the big planters had visions of one dollar a pound for long staple cotton. One inch cotton sold for 44c a pound. Even sharecroppers thought they were going to get rich in 1919. Everybody planted cotton. Then the bottom dropped out. Cotton went down to 10c a pound or less. The whole South was broke in 1920.

It now looks as though the "bourbon politicians" of the South have learned nothing and have also forgotten what they once knew. It remains to be seen whether Chester Bowles of OPA will have the courage to stand up against the cotton planters and impose a price ceiling on raw cotton.

Lambs Losses Prove Costly To Sheepmen

Lambing time is harvest time for the sheep raiser, and steps should be taken now to reduce the enormous yearly loss of lambs, says M. H. Kerr, associate professor of animal husbandry, U T College of Agriculture. That this is true is shown by the fact that some 80 per cent of all lambs lost before they reach market die before they are two weeks old.

Tennessee annually markets some 300,000 lambs for an approximate income of $3,000,000. This figure could be boosted considerably,Kerr says, if early lamb losses were reduced. To do this, the sheep raiser should plan his work to give him ample time to care for his flock during the lambing season. Suitable lambing pens should be made ready in advance. As ewes approach lambing time they should be kept separate from other livestock. They should lamb out on clean pasture; or, if weather is severe, in a well bedded pen.

The ewes' feed should be reduced at this time, but they should have all the fresh water they want. If the ewe is a heavy milker, don't feed her for the first 24 hours. Do not allow a ewe to lie on a cold floor or frozen ground.

It has been observed that a large percentage of lambs are born between 4 to 8 o'clock in the morning. Since this is the coldest part of the day, it is necessary for someone to be on hand to give assistance when needed, and to protect the lamb from chilling, etc. Once lambs are past the critical period, they need plenty of the right kind of feed. A good ration is made of three parts of ground corn, barley, or oats; one part of wheat bran, and one half part of cottonseed or soybean oil meal.

One source of trouble in lamb raising is improper nourishment. Lambs need plenty of an appetizing, succulent feed. Don't try to raise sheep, Kerr says, unless you have pasture for them, both permanent and temporary, since the success of a sheep program in Tennessee depends greatly upon this point.

Expert in Drama

DR. T. E. POAG, head of the Dramatic Art and Speech department at A. & I. State College won new laurels for the college by the superb performance of the Tennessee State Players Guild in the Southern Theater Festival held at A. & I. this month. His fine cooperation with the Dramatic Section of the TNEA last week made that department's program an outstanding feature of the Convention.

Chicago Baptists To Greet Congress Trio From Nashville

Chicago, Ill., (Special)—On Monday, May 6th, the Baptist Ministers Alliance for Chicago and Vicinity will present three national guests who will be here in the city as a vanguard of the Sunday School Congress 1946 session. They will be the Rev. H. B. P. Johnson, the national chorister from New Orleans, La.; Rev. Henry A. Boyd, secretary of the Congress of Nashville, and Miss S. B. Wilson, the enrollment secretary of the Congress and the office secretary of the National Baptist Publishing Board.

It is said that they will arrive Thursday or Friday, May 2 or 3rd so as to be in Chicago on Sunday when Secretary Boyd plans to head a flying squadron to visit many of the local Sunday schools for a three-minute talk. Dr. J. M. Foster, the president of the Alliance, declared that they would be the order of the day Monday, May 6, so that on Monday evening the national chorister will be in a position to begin his work of training the huge Congress chorus that will serve during the 1946 Summer School of Methods. The two song books and Anthems from which they will sing have already arrived in the city. The chorus participants who will make up this group of singers will meet in the Ebenezer Baptist Church, 4501 Vincennes Ave., at eight o'clock Monday night.

Rev. J. H. L. Smith, the entertaining pastor and chairman of the local committee, will bring a message of welcome, then he will turn them all over to Secretary Boyd, chorister Johnson and Miss Wilson, who will then perfect the organization, starting them off for their year's work.

"Feed The Family First" Is Slogan

"Feed the Family First" has become the slogan for club women of Macon, County. More and more they are seeing the need for being well fed, and they know that most of the best foods can be grown right on their own farms.

A study made of 124 farm families, covering every section of the county, shows that each of the families has a milk cow. Some have more than onc. Most of these families have had milk every day in the year.

These families have an average of 19 hens each and are turning out an average of 16 pullets per family. According to reports these same families have used at home 127 dozen eggs each and have eaten $74 worth of chicken meat during the year.

The meat shortage caused many families to eat most of their chickens, and it also increased the number of hogs to be butchered this winter.

A number of farmers have taken "turn about" with their neighbors in killing and sharing beeves and hogs to supply the need for fresh meat. The surplus was either canned or put in cold storage lockers.

Meat canned by 87 of the families reporting amounted to 2145 quarts. Fruits and vegetables canned and preserved averaged 169 quarts per family. Thirty three club women reported having made cabbage kraut. Fourteen have large jars of eggs preserved in water glass for home use.

Dried peas, beans and fruits, are listed among the things stored for winter use. Every family studied had a year round garden and reported 12 or more different kinds of vegetables growing during the year. Every family has a potato patch and most of them arranged for their own syrup.

Club women know that nuts are an important part of a good diet so they are careful not to sell all of their peanuts and pecans. They saved enough for home use.

Mrs. L. R. Daly, home agent, Macon County, recommends the above type of program for every farm family and says that an effort will be made in demonstration meetings to help in the cooking and serving of home grown products.

Social "Insecurity" Plans

Estimates of the cost of a comprehensive system of compusory social security in this country are staggering, ranging as high as 25 per cent of the income of every gainfully employed person. That these estimates may be far wrong, is indicated by England's exerment with social security. A bill has been submitted to the House of Commons which includes provosions similar to those set forth in the Wagner Bill—the American version of "all out" compulsory social security.

According to the New York Times, "It has been calculated that with the new bill, and on the assumption that not more than 5 per cent of the employable population will be unemployed on the average, the British government will be taking about 24 per cent of the gross income of individuals in compulsory contributions for social security and other forms of social services."

The tragic part of these "social security" proposals is that they would seize by law what most people would otherwise be able to class as "sovings." After 25 per cent of an average person's income is arbitrarily deducted by gov't., he will have precious little cash or incentive left to provide for his own future. Moreover, payment under the government program couldn't keep a church mouse alive and healthy in these days of inflation.

A traveling preacher was due to deliver a sermon at a Western church. Arriving at the church, he paused to read the sign in front or it, which said: "Subject for this Sunday: 'Do you know what Hell is?' Come and hear our new organist."

Milton Reports Black Root Rot Took Big Toll in State in 1945

By ROY H. MILTON

As I trekked across the State last summer, the following question was presented to me on numerous occasions: "What is the trouble with my tobacco? Look at the stuff. It is just standing there. Look at those plants; they are not much larger than they were when they were set. What is the matter with them?" I would reach down and pull up one of the most stunted plants. Immediately the trouble stared me in the face. A black mass of dead roots presented itself. Sometimes a few live ones had put out near the surface of the ground. These surface roots were keeping the plants alive.

My personal survey and statements made by County Agents lead me to believe that Black Root Rot took a toll of a million dollars out of Tennessee tobacco growers' pockets in '45. Burley growers suffered the most tragic loss; yet Black Root Rot is easily controlled in Burley. The sowing of a root rot resistant variety is all that is necessary.

Black root rot is caused by a specific fungus. You have seen threads running through damp, decaying light bread. Similar filaments can be seen running through tobacco roots, attacked by black root rot, when they are cut and placed under a microscope. The spores causing the disease are much more active during cool, wet springs. Last spring was not conducive to the growth of the black root rot germ.

The disease may make its first appearance in the plant bed where the bed is used more than one time; and a susceptible variety of seed are sown. Where the disease appears in the plant bed, it is transferred on the roots to the field. Much damage may be done in the field as a result of infecting the soil by this means. Caution: Beware of sowing old bed sites. Dr. W. Valleam, plant pathologist, Kentucky Experiment Station, makes the statement that he has known black root rot to appear in a bed that has been free of tobacco plants for a period of 15 years. The germs had lived in that surface soil and had at the same time penetrated the subsoil where they escaped the burning.

The disease can be prevented in the field by resorting to one of two methods: (1) Grow a tried and proven root rot resistant variety preferably obtaining seed from a certified seed grower; and (2) by growing the crop in a long time rotation—say five or six years. Limed land and manured land afford a better medium for the black root rot germ to propagate.

A satisfactory root rot resistant variety may be obtained through the Tennessee Crop Improvement Association office, 2321 West End Avenue, Nashville, Tenn., and the Kentucky Seed Improvement Association, Kentucky Experiment Station, Lexington, Ky. Our Greeneville Experiment Station has many varieties under study, but the two leading varieties are: Kentucky Experiment Station No. 16 and Kentucky Experiment Station 41 A.

The Kentucky 16 is a standup type (leaves have a tendency to stick up like a fox's ears), while those of Kentucky 41 A are semi drooped. The writer prefers a variety or strain having leaves that stand up, but he knows that the semi drooping variety has many admirers and growers. Give one a place on your tobacco farm in 1946, and blot black root rot out of your mind.

Observations through the years have shown me that the following varieties of burley may take the root rot and may be seriously damaged by its attack if burley is grown on the same land more than two years in succession, or in a short rotation, particularly in a rotation, where lime has been used: Barnett's or Barnett Special, Judy's Pride, Kelley's Improved Standing Up, Pepper and Bell's Bourbon.

Farm Drudgery Becoming Obsolete Due to Improvements In Methods

Drudgery a term long applied to farm work, is disappearing from rural vocabularies. Practical improvements in old fashioned methods of doing farm and home jobs and chores are the reason. Prominently active in this development are the 4 H Club boys and girls throughout the nation.

Many of these rural youths are utilizing electric power to perform farm tasks formerly done manually. Electrically operated equipment is being used to pump water, sharpen tools, hoist hay, heat pig and chick brooders, ventilate barns saw wood, milk cows and cool milk. In farm homes, electricity is being applicd to washing and ironing clothes, sewing, cooking, cleaning floor coverings and numerous other household jobs. Club members on forms not yet electrified are likewise saving time, labor, steps and money by applying modern methods of work simplification.

Numerous farm boys and girls are participating in the 1946 National 4 H Better Methods Electric Activity directed by the Extension Service. As incentives to cut standing records of achievement, the Westinghouse Educational Foundation offers merit awards. These comprise gold medals, trips to the 25th Anniversary National 4 H Club Congress in Chicago, December 1 5 and 200 college scholarships to county, state and national winners, respectively.

A dinstinctive feature of this activity is that it may be applied to every 4 H project. Four H members can produce full information from their county extension or home demonstration agents.

Last year's state and national winner in Tennessee was Charles Peal of Dyersburg. County winners were named in Crockett. Tipton, Marshall, Hamilton, Warren and Greene.

Competition To Bring Changes in Fruit, Vegetable Markets

Competition will be keen in the marketing of fresh fruits and vegetables in years to come, according to H. J. Williams of the Atlantic Commission Company, Rochester, N. Y.

D. W. Buck, a representative of the company, presented Williams' address at the sixth annual Tennessee marketing clinic this week and pointed out that many changes must be made in the present marketing system of fresh fruit and vegetables.

The consuming public will demand that more care be used in grading, handling and packing, Buck said. He told the group that during the war demands were so great for fruits and vegetables, many producers and distributors had to practically discontinue grading their products. In many instances certain vegetables were placed on the market and sold at a ceiling price that would not have been salable under normal conditions.

As the income of the consumer increases the amount of fresh vegetables consumed also increase, Buck declared. He told the group that if the producer expected to get as much of the consumer dollar as possible, it will be necessary for him to follow the six points:

1. Production must not be done haphazardly.

2. Production, grading, packing and marketing must be carried on economically.

3. Make use of simple packing plants.

4. Use grading and packing lines to prevent excessive handling.

5. Adopt a standard system of inspection, grading and packing.

6. Use new, standard, clean and attractive containers.

If the producers will work cooperatively in developing more direct routes from the farm to market, use better transportation and refrigeration, and market more matured products the demand for the products will be greater, Buck declared.

It was pointed out at the meeting that more than 40 per cent of all fruits and vegetables produced were wasted. The greatest part of this waste occurs on the farm. However, there is some waste involved each time the products are handled.

Frozen foods, the use of air transportation for fresh products, cooperatives, and possibilities for production on Cumberland Plateau were among the topics discussed at the clinic.

The annual marketing clinic is sponsored by the Chain Store Council cooperating with the U-T College of Agriculture and State Department of Agriculture.

Farm Talk With Farm Folk

By JESSE SAFLEY

PRESIDENT TRUMAN recently asked that the American people prepare for less food for the next several months. He suggested that it might be necessary for us to take another notch in our belts in order to prevent millions from starving in other countries.

The American farmer, of all people, would be the last man on earth to be responsible for people starving. He proved this during the war years. He produced under the most unfavorable conditions in the history of American agriculture. The only thing new he was given to work with was young and inexperienced labor. However, the job was done. Our people were fed and fed well.

Much of our enormous production was done by farmers who felt a duty to their country and their sons and relatives serving in the armed forces. They never ate a meal without wondering if their boys and girls were eating too. If by doing without sugar, coffee, farm machinery, fences, gasoline, tires and many other things plus working hard 14 to 18 hours a day would help these boys and girls, they were willing and did not complain.

Many of these soldiers are back home now, many others will be here soon. Farmers are going to known definitely that their boys are having plenty of food. But, I doubt seriously if all these farmers are going to continue working two days in one to produce food for people that are working only eight hours a day, those on strikes and those who are asking extra pay for changing clothes at the plant. Farmers not only have to work long hours without machinery. They can't even buy clothes to change. It's not because they are short of money to buy the clothes. There just aren't any clothes on the market. Why? It is not the farmers fault because there is plenty of the fiber.

The food supply is getting short. Meat may be scarce soon. The meat shortage has begun to worry some of our higher government officials. They want to do something to help. Some one has suggested that a good way to increase the meat supply would be to lower the ceiling price on heavy hogs. Feed is scarce and it takes more feed after the animal attains a certain weight.

The idea might work, but I sure would hate to have my preacher around when some farmers I know find out that it is in effect. One reason our meat supply is low is because there is very little profit to the farmer in feeding hogs. Some people who may not know might be interested in learning just about how much money a farmer does make out of a hog. Today, the most a farmer can receive for hogs on foot in Middle Tennessee is $14.55 per 100 pounds or $29.10 for a 200 pound animal. The hog actually costs him around $26.85, not including labor and use of equipment, which leaves a net gain of $2.25 for feeding it more than six months. The average shoeshine boy makes more than that each afternoon after school. If he did grow his own feed, he could easily have sold it at the same value.

You should understand by now why there is a shortage of meat. Some say lower the price to increase supply. Meat is not the only food product expected to be short.

When some folks start doing without bread and butter, there will be some more howling. Butter is already short and bread may be soon.

Farmers may have to keep on working without tools and equipment. He may continue to work 14 hours a day and even have to wear the same clothes week after week, but there is one thing sure, he'll never have to do without food.

If the American people would stop to think, they would realize that every bite of food they consume was grown on a farm. Yet, little consideration is given the farmer.

I have said before and I remind you again that every person who enjoys eating should be willing to help the farmer with his problems, instead of making it harder for him.

Soapboxers at It Again

The "holier than thou" individuals who seek publicity and public favor by attacking business, are out in force to defeat the Bulwinkle Bill which would definitely establish the authority of the Interstate Commission in approving the functions performed by rate bureaus and other similar carrier organizations, in establishing railroad rates which are subject to the approval of the Commission.

The Department of Justice sometime ago brought suit against the railroads on the grounds that the working together to establish uniform rates, they are conspiring to monopolize trade and commerce in violation of the Sherman Anti-Trust Act.

The Bulwinkle Bill would in no manner exempt railroad companies from the anti-trust laws, but it would specifically exempt from the Act their rates-making practices which have been developed over a period of 50 years under the Interstate Commerce Commission Prohibiting railroads from cooperating with each other under properly designated government authorities, in arriving at fair and equitable rates, would not carry out the real intent of the anti-trust act, but would result in great loss and inconvenience to the public.

Both the Interstate Commerce Commission in approving of fixing rates, and the railroads in initiating rates, are required to do so with a view to carrying out the national transportation policy declared by Congress; under that policy rates must be established and maintained all to the end of developing, coordinating and preserving a national transportation system; each railroad in establishing a rate, whether it be local or joint, must view the rates structure of which the rate to be established is a part, in its entirety; railroad rates through the country are parts of an integral whole and the railroad rates structure is not a loose aggregation of separately established rates but a single entity composed of interrelated rates. It could not be arrived at by each road working alone.

There is little ground for believing that the original intent of the Sherman Anti-Trust Act was to prevent this type of cooperation in the public interest under a public regulatory authority such as the Interstate Commerce Commission.

Public Ownership Defeated

At recent elections in Oklahoma, the people of Tulsa, Muskogee and McAlester voted overwhelmingly against candidates running on municipal ownership tickets. The real issue of each election was to decide if the people would discontinue the services of the private electric utilities and obtain their power from government-owned and operated hydroelectric plants. Cities and towns are finding that tax-exempt public power plant are costly luxuries for taxpayers, and without tax-subsidies cannot compete with private plants in rates.

WOMAN'S PAGE

COUNTRY PEACH PUDDING WITH LEMON SAUCE

8 canned cling peach halves
2 cups sifted all-purpose flour
2 tablespoons sugar
3 teaspoons baking powder
½ teaspoon salt
¼ cup shortening
1 egg
1 cup milk
Red jelly

Drain peaches. Sift together dry ingredients; cut in shortening. Add beaten egg and milk; beat 1 minute. Pour into greased rectangular pan (9x6x2 inches). Arrange peaches cup side up on top of batter. Place teaspoon jelly in each peach. Bake in moderate oven (350 degrees F.) 40 minutes. Serve warm with sauce. Serves 8.

Lemon Sauce

1 cup peach syrup
½ cup sugar
1 tablespoon cornstarch
Dash salt
½ teaspoon lemon extract
¼ teaspoon nutmeg
2 tablespoons butter or margarine

Add peach syrup to blended mixture of sugar, cornstarch and salt. Cook over low heat, stirring constantly until thick and clear. Add flavoring, spice and butter.

ORANGE CHEESE SALAD

1 tablespoon gelatin
1-3 cup orange juice
2 large oranges, sectioned
2 cups cottage cheese
¾ teaspoon salt

Sprinkle gelatin over orange juice. Allow to stand 5 minutes. Dissolve over hot water. Combine whipped cream, oranges, cottage cheese and salt. Fold together. Add gelatin, stirring lightly. Pour into ring mold that has been rinsed in cold water. Chill until firm. Unmold on salad greens. Serve with choice of dressings. If desired, garnish with additional orange sections. Eight servings.

STEWED RAISINS

Most of us are familiar with using raisins "as is" for salads, and in puddings and baked dishes. Try having them served as a cooked fruit for breakfast or dessert. The quick cooking method is recommended for plump, tender, well-flavored raisins. Allow one cup of water for each cup of raisins, boil 10 minutes, and add ½ tablespoon sugar for each cup of fruit.

GINGER FLAKE CAKE

¼ cup shortening
¼ cup sugar
1 egg
½ cup molasses
2 cups corn flakes
1 cup sifted flour
½ teaspoon soda
½ teaspoon ginger
½ teaspoon cinnamon
½ teaspoon cloves
½ cup hot water

Blend shortening and sugar thoroughly. Add egg and molasses; beat well. Stir in corn flakes, which have been crushed into fine crumbs, and sifted dry ingredients. Add water and beat until smooth. Pour into greased baking pan and bake in moderate oven (350 degrees) 30 to 35 minutes. Yield, 9 servings, 8x8-inch pan.

APRIL PLENTY

Eggs, older chickens for stew and fricassee, large turkeys, potatoes, fresh citrus fruits, cauliflower, and fresh frozen fish (but not shellfish) are expected to be plentiful in April the country over, according to production and marketing specialists of the United States Department of Agriculture. Supplies of fresh and frozen fish will not be the same in all localities, however.

The refrigerator car shortage, though still critical, is easier than it has been, and, with favorable weather conditions perishable foods should reach markets with less difficulty.

OYSTERS A LA KING AU GRATIN

1 pint oysters
1-4 pound mushroom caps
1 tablespoon butter or margarine
1-2 cup celery
i green pepper
1-2 cup water
2 tablespoons butter or margarine
2 tablespoons flour
1-4 cup cream
1-2 teaspoon Worcestershire sauce.
Salt and pepper to taste
1-2 cup cracker crumbs
2 tablespoons melted butter or margarine.

Pick over and wash oysters. Parboil in their own liquor until edges curl. Drain and reserve liquor. There should be a half cup of liquor. Peel mushrooms and cut in slices. Panfry in one tablespoon butter or margarine. Parboil green pepper for two minutes in boiling water. Drain and cut in narrow strips enough to make two and one-half tablespoons. Wash celery and cut in strips lengthwise, then crosswise in fine pieces. There should be enough for one-half cup. Cook seven minutes or until tender in one-half cup of water. Melt two tablespoons of butter or margarine and blend in flour and when smooth add the oyster liquor and cream. Add oysters, celery, mushrooms and pepper. Season to taste with pepper and salt and add Worcestershire sauce. Turn into a casserole and cover with cracker crumbs mixed with melted butter or margarine. Bake until crumbs are brown. Serves four.

POTATO VARIETY

When the thought of mashed, baked, or fried potatoes doesn't spark your appetite interest try cooking them in salted water to which a few bay leaves have been added and then roll them in a mixture of melted butter and paprika.

The juice of the crocus was used by Roman women as a hair dye. In recent years it has been used in making cordials and as a coloring for cake.

FRENCH POTATO BALLS

With a French cutter, cut balls out of parboiled potatoes (boiled 10 minutes in jackets), allowing six balls for each person. Fry in deep fat to a golden brown. Drain on unglazed paper and sprinkle with salt.

SHRIMP IN HORSERADISH SAUCE

1-2 cup butter or margarine
1-2 cup flour
2 1-2 cups milk
1 6-ounce jar prepared horseradish
Salt and pepper
3 dozen medium shrimp, cooked

Melt butter in double boiler. Mix in flour. Add milk. Cook, stirring constantly, until thickened. Add horseradish. Season with salt and pepper. Fold in shrimp and reheat. Six servings.

SWEET POTATO CROQUETS

2 cups cooked mashed sweet potatoes
Dry bread crumbs
1-4 cup butter or margarine
1-2 teaspoon salt
1-4 teaspoon nutmeg
1-4 teaspoon cinnamon
1 egg
3 green peppers, halved
1 1-2 cups white sauce
Parsley

Mix potatoes, 1-3 cup breadcrumbs, butter or margarine, seasonings and egg. Shape into croquets. Cover with dry breadcrumbs. Bake in hot oven (400 degrees) 30 minutes.

Parboil green peppers. Cut them in half and remove seeds and membrane. Fill halves with sauce made thus:

Melt 3 tablespoons butter or margarine. Remove from the stove and blend in 3 tablespoons flour until smooth. Add 1 1-2 cups milk and cook until thickened, stirring constantly. Season with 3-4 teaspoon salt and a dash of pepper. Fill pepper halves and garnish with parsley. Serve on hot platter with sweet potato croquets.

BREAKFAST TREAT

The flavor of donuts and the flavor of apple butter are natural affinities. When the donuts are split and toasted, this flavor combination is enhanced. To tempt lagging morning appetites try this delightful combination.

Eye astigmatism is caused by scarred or wrinkled condition of the cornea, the transparent windows in the skin of the eye before the lens.

SCALLOPED TUNA AND CABBAGE

Oil drained from tuna
2 tablespoons flour
1-2 cup water
1 2-3 cups evaporated milk
1-2 teaspoon salt
1-2 cup cheese, grated
1 quart chopped cabbage
1 7-ounce can tuna
1 cup buttered bread crumbs.

Drain oil from can of tuna into saucepan; blend in flour. Add water gradually and cook over low heat until thick. Blend in milk and cook until thickened, stirring constantly. Add salt and cheese and stir cheese until cheese is melted. Remove from heat, add cabbage and tuna, mix well, and place in buttered baking dish. Top with buttered crumbs. Bake in moderate oven (375 degrees Fahrenheit) until browned about 20 minutes. Yield: 6 servings.

CHEESE POINTS

1 3-4 cup flour
4 tablespoons butter or margarine
4 tablespoons lard
1 teaspoon sugar
3-4 teaspoon salt
4 1-2 tablespoons cold water
Grated cheese
Few grains cayenne

Cut together flour, butter or margarine, and lard until shortening is the size of small peas. Mix sugar, salt and baking powder with cold water and add to first mixture, stirring with a knife. Roll paste, one quarter inch thick, sprinkle with grated cheese and cayenne. Fold in two layers, roll out and repeat twice. Cut in three-inch strips and then in triangles two inches wide at the base. Bake at 400 degrees until delicately brown.

Sugar mixtures for candy should be simmered slowly rather than boiled or they will crystallize in the pan.

QUICK CONSOMME

Do you want to throw together a quick consomme that tastes as if you'd labored hours over it? Mix together two-thirds of a can of beef consomme with a half can of tomato juice. Season well with celery seed and dill seed or you can flavor it with a bay leaf, one or two cloves and a good tablespoon of paprika.

SAVORY SPINACH RING WITH LIMA BEANS

4 cups cooked spinach
3 tablespoons chopped bacon
1-3 cup minced onion
1-4 teaspoon celery seed
1-3 teaspoon salt
1-4 teaspoon paprika
1 egg, beaten
3 cups seasoned lima beans

Cook spinach with bacon and onions over low heat for about 5 minutes. Add seasonings and egg. Press lightly into buttered ring mold and bake 5 minutes, or until very hot. Unmold on heated platter and center with the limas.

After preparing fish, rub hands with salt and lemon juice before applying any soap. It will remove odors.

ANGEL TARTS

2 1-2 tablespoons flour
6 tablespoons sugar
1-2 teaspoon salt
1 cup milk
1-2 tablespoons margarine or butter
1 egg
1-2 teaspoon vanilla extract
1 banana, sliced
Sweetened sliced strawberries

Blend flour, sugar and salt. Add milk and cook in double boiler, stirring constantly until mixture is smooth and slightly thickened. Add margarine or butter. Beat egg and add. Cook until thick, stirring constantly. Cool. Add vanilla extract and mix well. Arrange sliced banana in 2 baked tart shells. Pour cream filling over them, and cover with strawberries. Yield: Enough filling for two four-inch tarts.

ASPARAGUS BAVARIAN SALAD

1 envelope unflavored gelatin
1-4 cup cold water
1 cup hot asparagus liquid
1 teaspoon salt
1-2 teaspoon celery salt
1-4 teaspoon white pepper
2 cups cooked asparagus
3 tablespoons red or green pepper, diced
1 cup cream or evaporated milk, whipped

Soften gelatin in cold water and dissolve in hot asparagus liquid. Add salt, celery salt, and white pepper and cool. Rinse mold in cold water and arrange stalks of asparagus around sides of mold. When mixture begins to thicken add remaining asparagus, which has been cut in small pieces, and red or green pepper. Fold in whipped cream or whipped evaporated milk. Pour into the mold and chill. When firm, unmold and serve with mayonnaise or French dressing. Serves six.

There are twenty-two known amino acids, of which ten are indispensable, and meat has all of these.

EGG AND BROCCOLI ASPIC

1 envelope unflavored gelatin
1-4 cup cold water
1-4 teaspoon salt
1 can (10 1-2 oz.) condensed consomme
1-8 teaspoon pepper
3-4 cup mayonnaise
1 1-2 cups diced hard-cooked eggs
2 cups diced cooked broccoli

Soften gelatin in cold water. Season consomme with salt and pepper, and heat. Add softened gelatin and stir until dissolved. Cool. When mixture begins to thicken add mayonnaise and blend well. Fold in eggs and broccoli. Rinse a 5-cup ring mold with cold water, garnish sides and bottom with small broccoli heads and slices of hard-cooked egg. Pour in enough of gelatin mixture to cover bottom of mold. Chill until almost firm, then pour in remaining mixture. Chill until firm. Unmold onto salad greens and serve with additional mayonnaise. Six to eight servings.

Note: Soup made with bouillon cubes, or soup stock may be substituted for consomme. Any desired vegetables, such as string beans, carrots, or spinach may be substituted for broccoli.

Tea was used in China as a medicine rather than a beverage until about 500.

Garnish salads liberally with paprika for eye and taste appeal. Paprika has a mild flavor and can be used without stint.

HOT SHRIMP SALAD IN GRAPEFRUIT BASKETS

4 medium-sized grapefruit
2 1-2 cups cooked shrimp
1-4 cup grapefruit juice
1 1-2 cups diced celery
1 tablespoon grated onion
1-4 teaspoon salt
Dash of pepper
1-2 cup mayonnaise
1-4 cup French dressing
1 cup finely rolled potato chips
1-2 cup grated American cheese

Cut grapefruit in halves; hollow out pulp to add to shrimp mixture. Clean shrimp and sprinkle with grapefruit juice; add celery, onion, salt, pepper, mayonnaise, French dressing, grapefruit pulp and heat thoroughly over low heat. Fill grapefruit shells with shrimp mixture, top with potato chip crumbs, sprinkle with grated cheese, place on a baking sheet and bake in a hot oven (450 degrees F.) for 10 minutes. Garnish with ripe olives and parsley and serve hot. Makes eight servings.

It is estimated that there are 50,000 distributors of fluid milk in the United States.

TAPE UNDER BUTTONS

Lost buttons, especially those torn out of garments, add greatly to the burden of family mending in many households.

Spring and summer clothes of thin fabric are likely to suffer most from buttons that pull out, taking some of the fabric underneath with them. A simple way to prevent such damage is to stitch tape on the inside of the garment under the button line. The stitched reinforcement does not show when the garment is buttoned and distributes the strain so that the small area of cloth to which the button is attached does not take the full pull. Stitch down each edge of the tape, then sew buttons through the center part of the tape.

On rayon clothes such a tape will prevent the damage that often comes from pressing too hard or with too hot an iron under buttons.

COLORED COTTONS

Russia is experimenting in the production of yellow, green, pink, blue and brown tinted cotton. Moscow textile mills will manufacture 350,000 children's suits from the naturally colored fiber this year.

Sorghum plants were first introduced into the United States from France in 1855.

EASILY SCORCHABLE FOODS REQUIRE EXTRA COOKING CARE

Most home cooks know from experience that some foods scorch more easily than others. Milk, for example, when cooked directly on the stove soon browns and burns on the bottom unless the heat is very low. The protein in the milk coagulates as the heat reaches it. The coagulated protein adheres closely to the pan soon becomes dry and then burns. This is why recipes for milk dishes, such as white sauce, cocoa, and custard, suggest heating the milk in a double boiler. Other familiar scorchers are cheese and eggs. The protein coagulates in the same way—one reason for always cooking cheese or egg dishes at low heat.

Some mixtures scorch easily because the heavy solid part settles to the bottom in a close rather dry layer, leaving the liquid or watery part on top. The cook, seeing only the liquid on top, often forgets what is going on at the bottom of the pan, and scorching results. Familiar scorchers of this kind are bean and pea soups, chowders, catsup, chili sauce and apple butter. Low, even heat and frequent stirring are advised to prevent scorching of such mixtures.

Some sweet foods scorch easily, too. Molasses and honey cakes and cookies need to bake at a lower temperature than plain cakes and cookies. Chocolate has a tendency to scorch, so chocolate cake, also, should bake in a slightly lower oven.

When cooking any of these scorchable foods on top of the stove, it is best to use a kettle with a heavy bottom that distributes heat evenly. Heavy aluminum is good for this purpose; enamelware and stainless steel poor. When cooking over burners that cannot be adjusted to very low heat, the cook will be wise to protect against scorching by using an asbestos mat between pan and burner.

THE MODERN FARMER

VOL. XIX. NASHVILLE, TENN., May 15, 1946 No. 4

The Road Up A Permanent "FSA"

By GILES A. HUBERT

The good news came this month that both the house and the Sen ate had passed legislation which provides for a permanent Farmer's Home Corporation which will take the place of the Farm Security Administration and broaden its ac tivities. The new agency would remain a part of the Department of Agriculture.

Thais is a signal victory for those who have fought for all these years against the powerful interests which have endeavored to kill FSA and the type of ser vice which it performs. These interests, if they could not kill the agency outright, wished to take it out of the Department of Agricul ture and placed under a commis sion which could be politically controlled by them.

Negro farmers can take hope at this turn of affairs. FSA has established a tradition of fairness, which, although not at all times lived up to, has set this agency out in front in Negro participation in its services. FSA stands ACE HIGH with Negro farmers even though it is to be criticized by them on specific counts.

At the end of the war there are still 37,700 Negro Standard Rural Rehabilitation borrowers from FSA in the Southern States. This fig ure represents 29 percent of all FSA borrowers in 14 Southern States, white and black.

These Negro FSA borrowers have an average farm size of 80 acres. They owned and average $1,542 worth of assets and they owe an average of $569. This gives them an average net worth of $973. They had reduced their Re habitation debt from $1,254. on the average, to only $488 at the end of 1944.

Now, these are the ordinary Standard R. R. borrowers. This does not include the astounding progress that has been made by Negro Tenant Purchase or Farm Owner borrowers. We referred to this group in last month's column.

The significance of all this is that it gives Negro farm leader ship a nucleus around which to build the future of the Negro in Southern Agriculture. Now that we are likely to have a permanent agency which will continue to provide the type of opportunities for Negro farmers that has been provided by FSA, the prospect is brighter.

The provisions in the new Bankhead bill for a loan program for the enlargement of farms to economic units and for placing aid to veterans under the new agency greatly improves the out look of help to the Negro farmer.

Here we have the facilities with which we can plan for sta bilizing a larger and larger group of Negro farm families and pro viding them with the necessary land, the necessary capital facil ities and the necessary guidance to allow them to compete on an

1600 Farm Men, Women at Farm Conference at Va. State College

Number Of Prominent Persons Were Present With Advice And Information

Ettrick, Va.— Sixteen hundred farm men and women attended the State Farmers' Conference at Virginia State College on April 11. Devotionals were conducted by Dr. Harry Roberts. The Welcome Address was given by Dr. L. H. Foster, President of the College. Dr. Foster paid high tribute to the farmers for their contributions made in winning the war. He urged a re dedication to the tasks ahead with the lessons learned in war to promote the blessings of peace.

Mr. L. B. Dietrick, Director of the Virginia Agricultural Exten sion Service stated that farmers must "Adjust or Adjourn" if they expect to hold their own and move forward. Farmers must keep up to date on facts of production and policy making. When the country was young 90 per cent of the pop ulation was required to produce necessary food. At present only 20 per cent of the population is required to produce food. If we are to maintain and improve our standards of living more people must secure employment in cities. The country needs state and na tional legislation to insure better housing conditions for tenants, contracts that will protect the landlord and tenants, social secur ity, education, improved health facilities, greater use of electric ity and telephones and better roads. Mr. Dietrick concluded by stating that policies outside the former's fence lines affect him daily.

Miss Helen Ricks, District Agent of the Virginia Agricultural Extension Service spoke on "Bet ter Homes - for Better Living." Miss Ricks stated that there are more than 100,000 houses on Vir ginia farms that are below stand ards required to maintain good health. From these homes we get

(Contiuned On Page 2 Col. 1)

4-H Clubs Witness Paint Demonstration

Raleigh, N. C.—A total of 253 4 H Club Boys participated in 14 "home made" paint demonstra tions recently staged in 14 of the county's 16 schools with organized 4 H Clubs. Aside from club members, a total of 14 adult 4 H leaders were on hand to witness the demonstrations.

4 H members were taught how to make paint by using old burnt motor oil and motor coloring. Colors of motor coloring used were venetian red and Spanish brown, which gave two colors of paint when mixed, red and brown. After mixing the paint it was used on boards to give the clubsters the benefit of seeing its fine finished surface. It was brought out that the paint mixture may be used on dwellings and all outbuildings, and can be made on the farm at a cost of Ten Cents per gallon. De scribed by one 4 H Club as "Mama Made Paint."

The demonstrations were con ducted in the schools of Juniper Level, Springfield, Wendell, Riley Hill, Eagle Rock, Lockhart, Roles ville, Sandy Fork, Fletcher Grove, Jefferies Grove, Shiloh, Apex, Holly Springs, and New Hill.

They were under the supervision of W. C. Davenport of the State College Agricultural Extension Service.

Dairy Products Bring Big Income

Mr. and Mrs. James Hall of Sar dus Community, Chambers County, have kept a record of poultry and dairy products sold from their farm

The Halls live on a milk route to the Carnation plant at Dadeville. From January 1 to October 1, they sold to the milk plant 5849 pounds of milk which brought them an income of $184. These cows gave a return of $4 per month each. With the proper pasture, better cows, and two milkings per day, each cow should give a return of $7 to $8 per month. The Halls now see the value of income from cows. It comes in monthly and solves the credit problem. They plan to do a better job with the cows next year.

They bought 100 baby chicks and lost only a few of them. After eating some of the fryers, they sold $20 worth. Mrs. Hall also raised a nice flock of turkeys which she will sell.

—Negro Farmer

Beef Cattle Production at St. Emma

ROCK CASTLE, VIRGINIA. The Agricultural School at the St. Emma Military Academy has secured a new herd of sleek and beautiful black-haired Aberdeen-Angus beef cattle for the school farms, to be used in the training given the cadets who study beef cattle production. This course includes judging, breeding, managing and feeding of beef cattle, also the fitting and showing at fairs and sales. Marketing and keeping records are also important parts of the course. Shown in the photo graph are Cadet Pfc. Leo Bradshaw, 15 (North Carolina) and 1st Sgt. Plater Campbell, 17 (District of Columbia). These boys also follow the regular high school studies at St. Emma, and are members of the Cadet Corps.

Negro County Agents And FSA Supervisors Help Veterans Avoid Farm Booby Traps

Washington, D. C.—Colored vet erans are being helped to steer clear of booby trap farms by Ne gro county agricultural agents and Farm Security Administration su pervisors, the U. S. Department of Agriculture reports.

Veterans who call on the county agent or the FSA supervisor are given first hand information on booby trap farms in the area. These agricultural workers point out the advantages and disadvan tages of farms offered for sale or for rent. They describe the kinds of crops which are grown in the various local communities, point out the best soil types and the number of acres required for growing these crops, and explain how a given farm measures up.

The agents and supervisors also emphasize the need for obtaining a farm of adequate size to produce enough to provide a reasonably comfortable living, and they warn

Colored Farm Youths Being Trained In Electricity Through REA Expansion

Washington, D. C. — Colored youths in some rural schools are learning about electricity—how it works, what it can do, and how to repair electrical appliances, say officials of the Rural Electrification Administration of the U. S. De partment of Agriculture.

One such school is the Dinwiddie Training School at Dinwiddie, Va. Here students repair electrical ap pliances which farmers bring to the school shop. The shop instruc tor, Wellington A. Hill, not only teaches the students how to repair electrical equipment, but he also encourages farmers to bring their broken appliances to the shop for repair instead of letting them lie around the house or throwing them away.

First year students at the school are taught a unit in fundamentals and uses of electricity. In this course, the students learn about fuses, switch boxes, connections, and other equipment that bring

More Negro Farm Homes To Be Electrified By R. E. A.

Washington, D. C.—More Negro farm homes in the South are to be electrified as a result of the Rural Electrification Administra tion's approval of a $5,500,000 loan to 16 electric cooperatives in 10 Southern States, officials of the U. S. Department of Agriculture said this week.

The REA loans will finance construction of 3,469 miles of new power lines to bring electricity to 13,025 Southern farms and rural establishments. About 9,500 col ored farm families live in the counties where the new lines are to be constructed. REA officials say that this extension of lines will make electricity available to a large number of these families.

There are more colored farm families than white ones in two of the counties in which lines are to be constructed. These counties are Pike of M ississippi, and Hali fax of North Carolina. Accord ing to the 1940 census, there were 1,627 colored and 1,515 white fam ilies in the former, and 2,286 col ored and 1,266 white families in the latter.

REA officials say that extension of lines into unserved areas not only provide incandescent lights to replace the old fashioned Kero sene lamp, but it also will help the farm people in these areas to have such home necessities as ra dios, electric irons, washing ma chines, and electric refrigerators.

They point out that the farmer's heavy schedule of duties also is lightened by such devices as an electric pump to draw water for his livestock and for irrigating his home garden or truck crop, electric brooder for his baby chicks, and portable motor for his cream separator, sausage grinder,

(Continued On Page 4 Col. 1)

Colored Farm Youths

(Continued From Page 1)

electricity to farms. A more detailed two-year course in these fundamentals is offered to boys during their third and fourth years of high school. In this course, students also are taught the history and theory of electricity and some fundamentals of radio.

During the fourth year special emphasis is placed on practical applications. Students begin by working on practice jobs in the shop. Then after they have gained sufficient knowledge and experience, they are sent out to work on housewiring and other jobs in the community.

REA officials point out that such training in electricity as is given in the Dinwiddie school and other schools is one result of the expanding program of the Southside Electric Cooperative of Crewe, Va. This is one of 900 REA financed cooperatives in America that are bringing electricity to thousands of rural families and institutions that have never had it before.

Southside co-op officials say that they plan to expand until every farmer, and all the rural schools, and churches in their territory are served. They point out that the training received by the youths of the Dinwiddie school and other schools will help achieve this purpose, because rural people with skills in electricity can help with the wiring of homes and the repairing of equipment and appliances.

Number of Prominent

(Continued From Page 1)

the most of our children. If we are to have better homes more people must develop a greater desire to have better homes. Details plans must be made by the families with assistance, and incomes must continue to improve.

Mr. L. M. Walker, Jr. Commissioner of Agriculture in Virginia, said that high wages and low prices for farm products have put a squeeze on farmers. Mr. Walker advised farmers to organize. You cannot accomplish very much in an organized society if you continue to live as a rugged individualist. Do not buy on time, defer spending unless necessary, and encourage interested youth to remain on the farm. He outlined the functions of the Department of Agriculture and Immigration and assured the group of his desire to be of service.

During the afternoon session Mr. J. E. Settle, Associate Professor of Animal Husbandry gave a demonstration in selecting the Market Type of Livestock. One group of farm men and women took part in judging mules, milk cows and hogs. The first prize which was a Guernsey Bull Calf was won by Mrs. Pattie Lee of Buckingham County, who had 225 points. A pure bred Boar was second prize and was won by J. W. Hudson of Mecklenburg County, who had 210 points. There was a tie for third prize by Nathon Boyton of Essex County and S. E. Hawkins of Halifax County, who had 198 points each. A pure bred Boar was awarded to both Boyton and Hawkins.

The Home Production of Poultry, and the necessary equipment needed was demonstrated by Mr. E. J. Thornton, Assistant Professor of Poultry Husbandry, and Mr. A. J. Miller of Agricultural Engineering Department. Mr. M. T Carter, Associate Professor of Agricultural Economics gave a demonstration and lecture on marketing poultry products At 3:30 p. m., the group re assembled in Virginia Hall to hear the College Choir, directed by Mr. J. Harold Montague.

Dr. Dabney Lancaster, Superintendent of Public Instruction for Virginia was presented to the group by President Foster. Dr. Lancaster urged the group to continue their interest for better education for every one in Virginia. He pledged his efforts to work towards that end.

In summarizing the conference Ross W. Newsome advised the farmers that this was the time to pay up all bills and remain out of debt, to use lime, phosphate, manure and cover crops to improve their soils. Good soils are needed to produce good livestock and healthy people. Invest in War Bonds now, and when equipment and materials are available, spend some of their savings to buy things that will enable them to operate their farms more efficiently and make their homes more liveable.

The conference was sponsored by the Virginia Agricultural Extension Service and Virginia State College. Dr. J. L. Lockett, Director of the Division of Agriculture, Virginia State College, presided at the conference.

Negro County Agents

(Continued From Page 1)

veterans against renting or buying poor unproductive land and against paying more for a farm than its long time earning capacity indicates that it is worth.

Discussing a report showing a continued rise in farm real estate values issued recently by the Department's Bureau of Agricultural Economics, Secretary Clinton P. Anderson said that inflated land prices deny our veterans their rights to security and opportunity in agriculture. "Few veterans can afford to take the risks involved in current high prices for farm land. Continued speculative up bidding of farm values will only increase the difficulties they face in getting established again in civilian life."

The BAE report shows that farm land prices rose 13 per cent last year and seven per cent during the last four months. As compared with average prices during the 1935 39 period, farm land is now up 71 per cent, meaning that a small farm which might have been purchased during the 1935 39 period for about $1,000, now costs $1,710.

High land values have caused the Farm Security Administration to slow down its farm ownership lending program in order to protect veterans and other prospective farm buyers from getting caught in an inflation booby trap. However, thousands of white and colored veterans of World War II are receiving loans to operate the farms they already own or are renting.

Up to March 1, about 11,000 veterans had received operating loans, and it is estimated that 10,000 more farmers— principally veterans— will receive operating loans this spring through an additional 15 million dollars which Congress has made available to FSA.

However, another factor that is slowing down the farm purchase loan program, according to colored advisers on the staff of FSA Administrator Dillard B. Lasseter, is the Negro veterans are not applying for these loans in as large a number as was expected. In 1944 an Army survey showed that 60,000 Negro enlisted men were planning to farm after their discharge. But according to FSA reports, in some of the home areas of Negro farm veterans, Negro applications have been negligible.

The advisers believe that the dearth of Negro applicants is due partly to their lack of information regarding the aid and services offered to veterans with farming experience through the Farm Security Administration. FSA loans and guidance are available to veterans who are unable to get credit from any other source. Special farm purchase loan funds have been earmarked for veterans. The colored advisers urge that qualified veterans seeking FSA loans should consult the county FSA supervisor or the county agricultural agent.

4-H Girl Is Success In Her Poultry Work

Jessie Watkins, 4-H club girl of Rogerville Community, Lauderdale County, Ala., received $105 from chickens in March. She sold 250 six-weeks old fryers weighing two pounds each for 42 cents a pound.

Early in February Jessie bought 300 baby chicks and followed recommended practices in feeding and care. She plans to raise 300 more chickens this spring for the market. Money from her poultry project will be used to buy a bedroom suite and other furnishings for her room.

Inflation Not Number 1 Problem

Controlling inflation is not the nation's number one problem. The number one problem is how to preserve representative government in the face of inflation. It may be impossible to preserve representative government because that is a political question and political questions are clearly within the power of the people to decide.

The argument is often heard that unless inflation is controlled, the resulting chaos will automatically destroy freedom, and history is called upon to support such an argument. But in answer to this it can be said that there has never been another nation in history like the United States. Her people are highly literate, closely integrated by modern communication and transportation, and well informed on the problems of the day. They have been taught almost from the cradle that their heritage of independence is their most valued possession. Nothing can take this heritage away from them. If it is lost, they alone must lose it. If they permit it to be lost in the turmoil of transitory economic upsets, they deserve to lose it. But they should realize now that the suffering of inflation will be as nothing compared to the suffering of political tyranny once it has a secure hold upon their lives.

No, inflation is not the nation's number one problem.

The Catch Is Human Nature

Usually when people are forced into doing what they do not want to do, or think they cannot do, or when natural laws are contravened by man-made laws, the reaction is incalculable. Compulsory health insurance is one of these instances. If it is adopted, the financial cost may boomerang in unexpected ways against the millions it was designed to protect. For example, it is proposed that half the cost of government-controlled medical care be borne by employers who would be taxed an amount equal to the medical care payroll deduction of the employe. This sounds good to the worker but many economists believe that such a levy against employers would so upset the economic system that, in the end, the worker would have to pay both his own and his employer's share.

According to an authority who has spent fifteen years studying the actual working of compulsory health insurance in various countries, "this might happen in any one of a number of ways. The price of goods might go up, and his (the workers) wages buy less. The employer might substitute machinery for some workers, and cut production to lay off others. Unemployment would result, and a wage cut would follow. Certain economists contend that the resulting wage plus the employer's tax would just equal the former wage. If such a contention is true, the worker will have to decide whether health insurance is worth 6 per cent of his income to him. That is almost half again as much as he now pays— on the average—for medical attention."

It is the old story. You can't get something for nothing.

The Beginning of Civilization?

The State Department has drawn up an American proposal for international atomic control to be submitted to the United Nations, which is encouraging. The proposal is based upon a report written for the State Department by a committee of leading scientists and business men who literally worked night and day for two months as practical men trying to find a solution to a practical problem.

Life magazine sums up their efforts in the following words: "The answer . . . sensibly recognizes that not even the atom can frighten nations into mutual trust. So . . . the report would set up an Atomic Development Authority which would work toward full international control by stages, none of them irreversible. In effect the U. S. would share its atomic secrets with the ADA only as fast as Russia and other countries give ADA personnel the right to free entry and inspection of all atomic facilities. The ADA would gradually take title to all uranium deposits and processing plants and would also build them in other countries. But it would do this on such a schedule that at eery step 'any nation such as the U. S., will still be in a relatively secure position, compared to any other nation.'

"An important fact turned up by the committee is that fissionable material can be 'denatured,' i. e., rendered useless for explosives while useful for peaceful applications. The ADA would distribute only denatured plutomium among member countries. To turn this into the dangerous variety can only be done by a different and hard-to-conceal process. . . . "

If mankind can adjust itself constructively to the atomic age it will for the first time be justified in applying the term "civilization" to its collective endeavors.

Dad, what was your great ambition when you were a kid?

"To wear long pants, son. And I've got my wish. if there's anybody in this country that wears his pants longer than I do, I'd like to see him."

Wheat-Sharving Loaves

Last week, the Office of Information release-room tables took on a new fragrance and appeal, awing to their use temporarily as a sideboard in which the Beltsville bakers of NSDA Gram Branch had spread out several loaves of good tasting bread made from the newly order 80 per cent extraction flour, to compare with other bread of ordinary white flour, later samples of these loaves went to Secretary Anderson and President Truman. I can get you photos of the Secretary nibbling the new bread and some shots of the loaves too, if you say so. It would make a new "miracle of the loaves," if not of the fishes. After all, isn't it about the same thing, when you have a bigger crowd to feed, something different must be done.

Small Savings Are Important

In many small ways the housewife can make an important contribution to food conservation. Added together these savings are important.

Prevent small every day wastes, the oil that runs over the side of the can, the cooking fat scraped out carefully when the container is thrown out.

Fats are often spoiled by careless cooking or improper storage. More attention should be given to careful scraping of dishes, pans and containers of fat.

A rubber-tipped dish scrapper is now selling again at kitchen supply counters. This is one of the best utensils for removing that last bit of fat, or any other food.

Remnants of cooking fat in cans should be melted down and poured out for use before the can is thrown away.

Pan dripping left from cooking meats should be scraped out. The part that has "browned on" will loosen by heating with a little water and then can be saved for gravy, soup or sauces. Too often these flavorful dripping go into the dish pan rather than the gravy bowl.

Much fat is wasted by careless cooking. Once fat has been scorched, or allowed to become rancid, it is good for nothing but soapmaking. In frying heat should always be watched to prevent wasteful scorching.

To keep fat from turning rancid or becoming moldy, keep it dry, cold and covered in a dark place, in the refrigerator, if possible.

A Permanent "FSA"

(Continued From Page 1)

equal basis with other farmers.

THIS IS IMPORTANT. THIS IS BASIC. Negro teachers, preachers, Extension Service Agents, Soil Conservation workers, and all workers in all departments and places of our agricultural work should take hope and throw the full weight of their support and energies behind this permanent "FSA." We should also stand ready to offer constructive criticism of the agency in its policies and operations as these affect family farmers in general and Negro family farmers in particular.

HERE IS THE TOOL. LET US BE PREPARED AND READY TO USE IT TO THE FULLEST FOR THE BENEFIT OF THE NEGRO FARMER.

FSA Wins Basic Law In Senate

Washington—Early adoption of a sound permanent law establishing a generous and permanent Farm Security Administration program appeared possible after the Senate last week passed without dissent the Bankhead Bill, S1507, to broaden the scope of the Bankhead Jones Act by bringing veterans under it, adding new loan programs, and giving FSA permanent operating authority.

Coming on the heels of House passage of the Cooley Bill, the Bankhead bill's passage opened the way for a conference between Senate and House in which provisions of the former could be rewritten to include the Bankhead Bill provisions.

The result will almost certainly be the best Farm Security legislation in history. FSA would become the Farmers Home Corporation, remain in the Department of Agriculture, and look forward to permanent operation without the necessity of awaiting action every year in appropriation bills.

NFU'S Fight Won

Meanwhile, the Agricultural Credit Agency Bill, strongly opposed by NFU' remained locked in the Senate Agriculture Committee, and it appeared unlikely that it would be reported. Therefore NFU's fight against consolidating FSA with other agencies and taking them out of the Department of Agriculture seemed to have been won, at least for this Congress.

The Bankhead Bill would greatly expand the scope of FSA by bringing under it veterans, and in addition providing a farm enlargement loan program long advocated by NFU. The latter is of very great significance and could easily prove more important than outright farm ownership loans so long as land prices remain at present high valuations. Under the bill, loans may be made to "improve family-type farms, to enlarge undersized farms, or to refinance indebtedness against under sized or under improved farm units."

This provision will assist thousands of family type farmers who have never been eligible for assistance under any existing government credit programs.

In addition, the bill specifies that "the average value of efficient family-type farm-management units" shall be the limit of the loan made for purchasing a home. This would end the obnoxious "average value of all farms" requirement imposed upon FSA by the House Appropriations Subcommittee in the past, which has greatly reduced its farm ownership loan operations.

Moreover, the bill sanctions the rural rehabilitation loan program so long left at the mercy of the appropriations groups concerning grants to individuals and to health co operatives:

"Grants may also be made to such eligible individuals where necessary to aid in their rehabilitation, and to cooperative associations furnishing medical, dental or hospital services to such individuals."

Less than half the cities of the United States of more than 1,000 population have airports.

Hale Farmers Are Succeeding With Winter Grazing Crops

Two hundred and fifty acres of grazing crops were planted by Negro farmers in Hale County last year. This acreage included 23 result demonstrations to show the value of grazing in a livestock program.

Farmers who planted these crops used 400 pounds of phos phate per acre, then broadcast and disked the seed into the soil. Two hundred of the 240 acres planted the first year are now giving good grazing.

Ernest Chavers of the New Hope Community has a six acre demonstration plot of Caley peas. He is grazing six of his best dairy eows on this area. Chavers already has reported about 366 days of successful grazing.

Peter Collins of Sunshine Community reports good results from his result demonstration. He has a p lot of 12 acres of Caley peas. He averaged 40 days of successful grazing with 12 of the best producers from his herd of 30 dairy cows.

Richard Blunt of the Curry Grove Community is doing a good job with alfalfa. He has five acres planted. He first turned under a heavy growth of winter legumes on this area, then applied barnward manure and 400 pounds of phosphate per acre. He is doing much to break down the idea that alfalfa will not succees on Black Belt soil. This idea is common among a large number of farmers in this area. Blunt believes that if well drained lime land is selected and highly fertilized a good crop of alfalfa can be produced. His alfalfa is about eight inches in height and should be ready for the first cutting about June.

Six demonstrations of crimson elover were started last fall in the northern part of the county. These demonstrations consisted of 30 acres. Four of these demonstrations are succeeding and have given early spring grazing. Allen Muse and A. J. Holley report good grazing for their hogs and dairy cows during late winter and early spring months.

Many farmers visited the experiment station at Marion Junction in March to see what is being done with Caley peas, alfalfa, and elovers. After seeing the results, they went home with renewed faith to improve their plots and help their neighbors get started with grazing crops.

A meeting at the result demonstration in every community is being conducted. This is to further the devolopment of the demonstration and to use it as a teaching value in getting more acres established throughout the County. —NEGRO FARMER.

Crop Production Report for February

Weather factors for the future crop season seem to be the biggest question mark ahead, according to Crop Reporting Board's analysis of conditions in the critical food year of 1946.

Final reports are in on citrus fruit volume for 1945 and prospects for the third largest tonnage of winter truck crops are in sight.

Total citrus output for 1945, 187 million boxes, 50 per cent above the 10 year average, with oranges making 106 million boxes, provides a backlog of high vitamin foods. Grapefruit accounted for 62.8 million boxes and lemons made about 14 million.

MILK PRODUCTION— January estimate was 8.6 billion pounds which hit the lowest level since January, 1941. Percentage of cows milked on Feb. 1 was 63.4 percent, or the laowest in 21 years for that date.

Significant notes are available from the report as to feeding of dairy herds. Milk cows numbers are definitely down and still going down. Farmers are turning their poor milkers and strippers dry, while feeding the rest more liberally. The rate of grain fed per cow for the whole country was 5.5 lbs. per head daily, which is 15.5 per cent above the 1935 44 average rate. Milk produced per cow Feb. 1 on a national basis was figured at 13.4 lbs. daily, or about 7 per cent better than the 10 year average.

Favorable weather and no apparent reduction in feeding of flocks resulted in a record high rate of laying. January production was said to be 4.2 billion eggs, 2 per cent above last year and 48 per cent over the 10-year average. Rate of lay per hen was another record, at 10.2 eggs for January.

POTENTIAL LAYERS (laying hens plus new pullets) as of Feb. 11 was estimated at 444,188,000 birds, at least one per cent above last year on this date and 7 per cent above the 5 year average. Intentions to buy baby chicks took a drop of 14 per cent under purchase in 1945. Farm egg prices for January averaged 41 cents a doz., but markets were weaker than they were last year under somewhat heavier receipts. Yet demand caught up well with heavy supplies. The mid January cost of the farm poultry ration was $2.98 per hundredweight, or 12 cents higher than it was a year ago.

4 H CLUB GIRLS PRODUCE FOOD

Madison County 4 H Club girls are selecting garden and canning projects so they can produce and conserve more fool this year.

Club girls learn from their garden projects how to (1) increase food supply, (2) use fertilizers properly, (3) cultivate vegetables, (4) select the kinds of vegetables suitable for their section, and (5) control garden insects.

Dorothy Pulley, 4 H Club girl of Toney Community, is beginning her fourth year in 4 H Club work and has projects in gardening and clothing. Last month she made a report on her work during the month of February. She planted lettuce, turnip greens, mustard, English peas, cabbage and carrots. "I am going to see how many different kinds of vegetables I can grow in my garden this year. I am planning to sell and can vegetables that will not be needed by the family during summer," s ays Dorothy.

Dorothy has also made a good start with her sewing project. She made a dress for herself in February and plans to make at least one garment each month. Dorothy is setting a fine example for 4 H Club girls in the county.

Grand Champion Fat Hog Sells for $841

The grand champion fat hog in the Chattanooga 4 H Club and FFA Fat Hog sale brought $2.90 per pound or $841. The hog was owned by R. J. Hagley, a 17 year-old FFA member from Charleston, Tenn. J. S. Robinson, swine specialist of the University of Tennessee, who was in charge of the sale, said he believed this was a record price for pork on hoof Fred Fisher, of Rockwood, was the purchaser.

Gene Porter, of Bledsoe County and another FFA member, sold the reserved champion which brought $1.90 per pound.

Club Calves Are On the March

The 4-H club boys and girls of Montgomery County have increased their Beef Calf Projects by 350 per cent. They have 18 this year, and last year they had only four. The increase was caused by the information gained at the Fall Stock Show in Montgomery last April. Farmers and their boys and girls attended the show upon the request of their agent, J. T. Alexander, who said, "Parents and club boys and girls saw at first hand what it takes to have a good calf." Club members are now planning to make entries in the 1946 Fat Stock Show.

4 H clubsters are encouraged when state extension supervisors and others visit their calf projects.

Among Us Scribes

TRIP DATES — August Hanke, Watt Pub. Co., Mt. Morris, Ill., reminds us that the Annual Boy Scouts of America Convention is at St. Louis on May 16, 17, and he is a member of the steering committee and wants to attend. But he is afraid thas will conflict with the editorial trip to Washington and Beltsville. How many editors are boy scout enthusiasts and see any conflict ahead, as Hanke does?

SAME TOPIC — Cy Moffit and Wis. Ag says he is coming to join in with the eidtors on this same excursion, as he has never been East and wants to climb the Monument and so forth . . . . Milon Grinnel writes that he hopes V. P. John Pickett of S. California will dust off his grips and buy a ticket for the event, to represent the Golden West

OMIT "VICTORY" — Andrew S. Wing, manager of the former National Victory Garden Institute writes to remind us to omit the Victory from the title henceforth—everything else stands however. It will be tuned to help the home gardener in a year when food will be needed badly.

BEECH & WILLIAMS—Southern Farmer, Montgomery, announces the new editor, Gould Beech, returned veteran, former editor of Rural Alabama, an extension periodical, and reporter on other Alabama papers. Aubrey Williams, publisher, says Beech is a hard hitting liberal writer.

NEGRO FARM JOURNAL—Modern Farmer, founded 18 years ago by Dr. Henry Allen Boyd of the Negro National Baptist Convention, is edited in a sprightly and useful style by Giles A. Hubert, professor of economics at Fisk University, Nashville. Hubert owns a 500 acre farm in a colored community founded by his grandparents, known as the Log Cabin section, in Georgia. He spent a year in Denmark before the war, and has traveled in the West Indies studying agriculture there. He is in a wonderful position to extend aid and comfort to many colored rural families. Good luck to him.

ELLIOTT TO PF—Joe Elliott has left his job as associate editor of University of Tennessee to become associate editor on Progressive Farmer at Birmingham, where Alex Nunn presides.

CORRESPONDENTS — Letters from J. E. Cananaugh, Hoard's Dairyman; Sam Guard, Breeders Gazette; M. C. Small, Turkey World; Richard Lane, So. Refrigerator Journal, new Memphis mag for frozen food industry; Geo. Edwards, Western Live Stock Journal-Los Angeles; and Jim Draper, Southern Stockman, who sent us a good yarn about livestock feeding studies by Memphis Chamber of Commerce, which we will soon quote.

JEWISH INFORMATION SET UP—As a public service an information section has just been established by the American Jewish Congress, 1834 Broadway, New York. A two color wall newspaper issued monthly for classrooms and public places, a weekly feature service and a pamphlet series are issued.

FARM LABOR REPORT—In February, 1946, all persons employed on farms numbered 7,799,000, compared with 8,051,000 a year ago. Hired workers alone amounted to 1,424,000 persons, 5 per cent less than last year. Extension Service gives the 1945 veteran placements on farms at 34,368 as hired hands or tenants. Annual 1945 national farm wage rates averaged 350 per cent of the 1910 14 base, compared with 154 per cent of it in 1941. Per month with board, the 1945 average wage was $82.30, hitting a high of $142 in Washington, and a low of $32 in So. Carolina.

POTATO MISHANDLING INJURIES (USDA Circular 744)

Inasmuch as shipments of early potatoes from 23 Eastern and Southern States in 1944 totaled 72,738 carlots, the new circular 744 by D. H. Rose, Division of Fruits and Vegetable Crops, Bureau of Plant Industry, USDA brings some important cautions to save losses in handling and shipping.

Some of the worst injuries caused by bad methods or carelessness are included, with typical photos. Among these are feathering or pealing of the outer skin, (resulting in browning and sticky decay) bacterial soft rot and black rings caused by excessive temperatures.

Types of leads are discussed as to their suitability for various distances and other conditions. These include the 3-2-3 and 5-3-2-1 phyramid load, 360 bag pyramid, 450-bag through load, aisle loads of 300 100-lb. bags, and a 3 by 5 "bumped" load of 360 bags in stacks crosswise of the car ends and doorway. These are interesting comparison, full pictured.

Icing and pre cooling and the limited use of fan equipped cars, and the relation of containers to bruising damage are discussed in some detail. The author says that tests reveal that in the absence of decay, claims for shrinkage in transit above 2.5 per cent cannot be supported.

Wheat Crisis in World War I

Early in 1918 the U. S. had a small wheat carryover, only 30 million bushels. Yet the plight of Europe's war torn people was desperate, so Americans responded as usual.

People observed two wheatless days each week and were asked to have one wheatless meal each day. Consumers purchaees of wheat flour were cut to 255 pounds at a time in cities and 5505 pounds in the country. But to get this flour customer had to buy as well the same amount of wheat flour substitutes. Such substitutes included corn meal, corn grits, rice and oatmeal. No wheat was sold for livestock feeding. (However, fewer households buy flour for bread making at present.)

Congress prohibited all distillation of liquors after Sept. 1917. This saved 40 million bushels of grain that year. Later, in December of 1917, no grain unless unfit for human or animal use, was allowed to be used in alcohol distilling of any kind whatever.

USDA to Review Goals and Supplies of Food

In an anniuncement made late in the past week, Secretary Anderson said that a general review and analysis of the whole production goal picture is in order. This is beease of the serious world food situation.

Besides asking SDA staff specialists to review production goals, the Secretary included a request for a similar review of all procurement figures and distribution programs, so as to obtain accurate facts on available supplies and decide on the proper way to allocate them in view of the altered requirements. The revised figures and suggested changes to be proposed should be available in special emergency reports within two weeks, according to the Secretary's expressed desire.

In a talk at the National Farm Institute at Des Moines on Feb. 15, in reference to soybean support prices and the fats and oils requirements, Secretary Anderson stated that because the need will be greater than anticipated, the Department has recommended to the Economic Stabilization Director that the same support price as prevailed last year for soybeans be continued, at $2.04 a bushel.

U. S. Flour Extraction Rate Compared

United States flour mills under the proposed order to extend 80 per cent of the wheat will still operate under a lower milling rate than many other countries USDA figures indicate. Office of Foreign Agriculture Relations gives these percentages of wheat extracted under official regulations in various countries:

85 per cent in Netherland, Norway, Poland, North Africa and United Kingdom; 90 percent in U. S. zones of Germany. Greece, Hungary, Portugal and Yugoslavia; 90 to 95 per cent in France, and from 80 to 96 per cent in Russia.

More Food Is Goal of 4-H'ers in Morgan County

Late winter and early spring found Morgan County's 4-H club members busy preparing 1946 project "more food on the farm" as their goal.

They selected gardening poultry, swine and other livestock, field crops, food conservation and preparation for their project. The boys and girls have been taught through demonstrations how to get an early start with garden Small boxes were filled with garden seeds, and placed indoors near windows where they could get light and sunshine.

Information and demonstrations on poultry production included preparation of ample nest space, egg selection for incubation, and proper feeding and housing of baby chicks.

4-H boys will grow more corn this year.Efforts will be made to increase the yield per acre. They are using varieties that give high yields. They have learned the proper use of fertilizers and the best methods of cultivation. Club boys will be able to grow more livestock when they grow more corn on each acre.

At present 310 girls and 252 boys are enrolled in Morgan County 4-H club.

Other Nations Also Conserve Wheat

According to OFAR announcement, some of the recent programs to be put into effect to secure a large international "pool" of wheat to help relieve distress and hunger in foreign countries, are as follows:

Argentina has discontinued using wheat for fuel, and an inerease in guaranteed prices for farmers may result in a rise over the 1945-46 small crop of 4½ million tons. Australia is rationing wheat for feed and expects an increase in acreage for 1946-47. Canada is considering making No: 4 Manitoba wheat, formerly fed to livestock, available for food, and wheat acreage goals for 1946-47 are reported at 23.4 million acres, or the same as last year's harvested acreage, but larger than the goal of 21.5 million for that year.

The United Kingdom will continue to forbid the use of wheat for livestock and acreage goals of 2.5 million acres for 1946-47 are about the same as last season. (Following a conference with Sir. Ben Smith, British Food Minister, Secretary Anderson announced last week that the United Kingdom had agreed to reduce its import requirements of wheat for the coming months.

MILK SUPPLEMENTS FAMILY'S INCOME

Jim Thompson of Lauderdale County is supplementing his income by selling milk and butter to the local creamery. His monthly check from milk and butter is $110.

Thompson bought seven grade Jersey cows in December. At first he sold milk to the eheese plant in Russellville. Because of the distance of the plant from his home, the cost of driving a truck to carry his milk was too high. He decided to sell his milk at home, and cut the cost of handling. Now he sells 176 pounds of whole milk daily to the creamery in Florence at $.04 per pound. Each week he sells 30 gallons of butter milk at 30 cents per gallon and 14 pounds of butter at 50 cents per pound.

Thompson has had to buy some feed for his cows while he is getting his permanent pasture ready for grazing. When his pasture is ready the cows will get their own feed and the cost of producing milk will be cut.

In less than four months, Thompson has had to buy some of his income from milk. In the coming months he is planning to repair and beautify his home.

Thompson says he likes "having a steady income."

grindstone, and feed grinder.

Lights for rural church, and electricity for the school shop and the local establishments serve the entire rural community.

The Southern States in which loans were approved for cooperatives are: Alabama, Arkansas, Georgia, Louisiana, Mississippi, North Carolina, Oklahoma, Tennessee, Texas, and Virginia. REA loans were approved also for 14 cooperatives in eight States in other regions.

4-H Club Boy Aids Food Production

With his garden project Thomas Hurd, member of Union Rosenwold 4-H Club, Elmore County, played his part in the food production program. During the past 15 months, he received more than $120 from the sale of vegetables. He sold them daily on the Wetumpka market as he rode to school on his bicycle.

In his one-half acre garden, he grew English peas, squash, cabbage, string beans, butter beans, onions, okra, carrots, and pepper during the spring and summer months. He is growing turnips and rutabagas in his fall garden.

Thomas owes his success to such practices as getting good seeds, using fertilizer, preparing his soil well, and controlling diseases and insects.

The clubster did not forget the family table and jars. Vegetables from his garden were canned, dried, and stored for future use.

Soybean Meal Damages Hatchability of Eggs

Soybean meal has proved valuable as a protein in poultry food. But poultry specialists of the U. S. Department of Agriculture warn against too heavy feeding of soybean meal to laying pullets and hens in breeding flocks. As far as egg laying, size of eggs, or body weight are concerned, heavy feeding of soybean meal seems to have no bad effect. More than ten per cent of soybean meal in the diet of breeding flocks does lower the number of eggs hatched.

—Negro Farmer

EDITORIAL

One summer, a friend of mine, who was an official of the Department of Agriculture and a Southerner, and I were driving through the lower tier of Southern States and this friend made the following statement: "Lord, I wish that something would cause it to rain paint down on this country.

Well, it may not actually rain paint, but the prospect is that we may have many more painted houses. The general Housing Bill recently passed by the Senate provides that any farm owner, otherwise unable to secure credit on *reasonable terms*, can obtain a loan at 4 per cent for 33 years terms to build him a house or to build and improve the housing of his tenants.

The bill also provides that county and city housing authorities can secure funds to build adequate housing for farm laborers and for rural people employed off farms and who have no prospects of securing economic sized farm units.

When this bill becomes law and if it is democratically carried out, the South, in a few years may appear as if something had rained paint down on the country.

How much easier it will be to interest the youth of the open country in the life that they live if this life can include a decent, comfortable place to live—a home that will compare favorably with what he can expect to have if he went to the slums of the city.

If it will "rain paint," then let it rain; LET IT RAIN.

AKAs Push Food Conservation to Check Starvation Abroad

Joining in the Famine Emergency campaign to help check starvation abroad, the Non-Partisan Council of the Alpha Kappa Alpha sorority is sending out letters to its 175 local chapters, calling on them to help spread the food conservation message, according to a statement the U. S. Department of Agriculture received this week from AKA headquarters.

Mrs. Thomasina W. Johnson, national official of the organization, says that along with the letters go brochures and leaflets on the Famine Emergency campaign. She says that she expects the local AKA chapters with their 6,000 members to stimulate conservation activities in such major center as New York, Chicago, St. Louis, Detroit, Los Angeles, Houston, New Orleans, Memphis, Atlanta, Washington, Baltimore and Philadelphia.

Mrs. Johnson points out that although thousands of white and colored Americans here at home are undernourished, our situation is almost ideal compared with starvation diets in Europe, and in parts of Asia and Africa.

The letters to the local AKA chapter suggests that Victory Gardening be encouraged, and that potatoes, poultry, fresh fruits and vegetables be used when possible in place of wheat products, fats and oils. The membership is urged especially to cut down on bread, macaroni, spaghetti, pies, cookies, and breakfast cereals.

Mrs. Johnson estimates that the AKA membership alone could save 20,000 loaves of bread a month by serving their families potatoes instead of bread twice a week.

At Random

Pictures for illustration stories about the hunger abroad and its relief are being assumbled. Red Cross, UNRRA and the Army Signal Corps are the chief sources. If you wish to deal direct on this write to Chas. W. Jackson, OWMR, 734 15th St. N. W., Washington 25, D. C., giving your preferences. . . A statement on aspects of the British Loan Agreement has been prepared by State Dept. for your reference. . . . .A thick report of many pages on world food situation is ready from OFAR. Those who wish copies may apply through me or direct to Francis Flood's office.

Farm Credit Veteran Loans Reviewed

The national summary of approved veteran farm loans for World War No. II by Farm Security Administration has been supplied by Ralph Picard, FSA director of information, as follows:

Under Rural Rehabilitation, for current fiscal year they consist of 2,770 loans for $4,897,296; plus supplemental loans of the same nature amounting to $289,442 on 289 loans. Under Farm Ownership section, there were 217 loans made for $1,574,625. Under "other" loans there were 29 placed for $39,962.

Cumulative loan figures for veteran farm loans through December, 1945, show 5,320 RR loans for $8,110,503; supplemental RR loans in addition numbering 774 for $570,675; Farm Ownership loans of 283 for a total of $1,911,409; and "other" loans amounting to $73,972.

Farmer Sells Baby Chicks

In 1927 Claude Thomas of Benson Coummunity, Tallapoosa County, with a few hens and a will to succeed, went into poultry business. The first year he hatched around 400 chicks in his 75 egg Capacity incubator.

By 1945 his hatchery had been enlarged and improved with much hard work and cost of $570. This cost included his brooders and a 400 egg capacity incubator. He keeps a flock of 122 certified hens which he carefully selects and culls.

Thomas' egg production in 1945 was more than 11,000. He hatched and sold almost 10,000 chicks which netted him $15 per hundred.

1946 Livestock Numbers

Hogs anl poultry up, all other livestock down, was the Jan. 1 inventory report. In terms of grain consuming units the total was a trifle larger than a year ago, but in terms of hay and pasture units, the number of livestock was 4 per cent less. Feed grain supply per animal unit, including poultry, is 5 per cent smaller than 1945 but much greater than two years ago.

Agriculture Department Seeks to Improve Working Conditions for Negro Migrants

Washington, D. C.—The need for improved employer-employee relations to make for more effective utilization of Negro migrant farm workers has been emphasized by Barnard Joy, chief of the U. S. Department of Agriculture's Extension recruitment and placement division, in a memorandum to State supervisors of the emergency farm labor program.

The memorandum, entitled "What Negro Agricultural Workers Want," was accompanied by a copy of a paper read before the Atlantic Coast Migratory Conference at its recent Baltimore meeting by Frank M. Staley, colored farm labor assistant.

Mr. Staley explains in his paper that acceptable housing, good camp and field managers, improved transportation, and reasonably good pay will attract and hold efficient colored migrant farm workers.

"The Southern Negro migrants want housing arrangements that permit them to maintain their group unity with facilities for living, cooking, and eating as a family unit," says Staley.

He also urges that truck transportation be replaced by buses, and that camp and field managers be selected more carefully.

Farm Talk With Farm Folk

By James Sofley

Since the first of May, we have visited 73 rural homes located in seven counties in Middle Tennessee. Most of these homes were farm homes. However, a part of them were located on small lots. The thing in which we were most interested was to find out how many hogs the average rural family was feeding and to what use they were going to make of them. Thirty-seven of the 73 families visited did not even own a hog, 11 farmilies owned one or two and the other 25 owned seven or more. Only one of the 73 families was feedng hogs for the market, but a number of the others were going to sell a few pigs.

No one can blame a farmer for not feeding hogs for the market because there is absolutely no money to be made out of it. But we believe that any rural family which does not feed one or more hogs for home use is making a mistake. We realize that a farmer can find many reasons for not raising a hog if he didn't really want to feed one, such as not being able to buy small pigs or not having a place to keep them or that the government has asked us not to feed grain to livestock, or that you can buy the pork cheaper than you can grow it. This farmer fails to realize that he won't be able to buy pork or pork products next winter, so now it is either "do" or "do without."

Hogs can be fattened for home us with very little or no grain if the farmer is willing to put out a little extra effort. The average rural home has enough scraps from the kitchen to go a long ways towards feeding one hog. Now that vegetables in the garden are getting large enough to eat you have extra food for the hog and as the growing season progresses, there will be still more. Your hogs may not want to eat raw cabbage leaves, old carrots and onion stems. Have you ever tried cooking them? Some of you will probably hesitate cooking for a hog, but chances are you are cooking for dogs and cats daily. Just think, you have the consolation of knowing that some day you will get to cook the hog.

That hogs will eat that will be a help towards fattening them. For instance, they will eat weeds from the garden and potato patch, johnson grass roots and sassafras leaves and a lot of other wild vegetation if, they are given a chance to eat them. We know that hogs will eat these things because we have fed them all these things not just once but for weeks and weeks. The hogs will not fatten as quickly as they will on grain and tankage, but they will gain in weight.

We believe that any rural family that wants pork can have it and we are also sure that those who can and don't will "squawk" the loudest this winter when they are unable to buy lard, bacon, ham and other pork products. Any rural family which does not have these things this winter will have no one to blame but themselves. How many hogs are you feeding for home use.

Again we want to remind you to attend the Middle Tennessee Farmers and Homemakers Institute at the Experiment Station at Columbia next Wednesday, May 15, if at all possible. It will be a day that you will long remember. In addition to gaining valuable farm information, you will see and meet farm friends from all sections of the state. Lunch will be provided by the Maury County home demonstration women or you can bring a picnic lunch. There are many beautiful shade trees that would make good picnic spots. We'll see you at the "station."

Nashville Banner

Screwworms Playing Havoc With Livestock

Livestock producers this year had great trouble with screwworms.

W. H. Gregory, API extension livestock specialist, says that "this epidemic is caused by warm weather during February and March and the over-wintering of insects in Florida. An ounce of prevention is worth more than a pound of cure. It is very important that every animal be seen at least three times a week. Look for the bloodstained liquid coming from a wound which is a sign of the screwworm being there.

Smear No. 62 is the best remedy known for wounded animals, and also for killing the worms in animals. It should be applied twice a week to any wound, no matter how small, to guard against Screwworms.

"Animals should not be dehorned, branded or castrated during screwworm season."

—Negro Farmer

Prepared for Meat Shortage

A meat and lard shortage this year will not effect Mrs. Annie B. Orr, pantry store demonstrator of Danville Community. In addition to cured meat, she has canned 86 quarts of meat for her husband and herself.

Mrs. Orr knows that the family diet should include a certain amount of meat, especially lean meat. She also knows that cured salt pork will not give the body the needed amount of protein. Therefore, canned food on her pantry shelves include pork, beef, chicken, opossum, and rabbit.

Although Mrs. Orr cans many jars of foods, she does not forget that the quality of the canned products is as important as quantity.

USDA Favors National Health Legislation

Washington, D. C.—(Notice to Correspondents: There follows a summary of a statement prepared for delivery by Assistant Secretary of Agriculture Charles F. Brannan The text of the 20-page statement is available on request from Press Service, Office of Information, Department of Agriculture.)

Testifying on the National Health Bill before the Senate Committee on Education and Labor. Assistant Secretary of Agriculture Charles F. Brannan announced today that the Wagner-Murray-Dingell Bill "has the full support of the Department of Agriculture, and I am convinced that it has the backing of the farmers of America."

Appearing as the representative of the Secretary of Agriculture, Mr. Brannan read a prepared statement which emphasized the fact that the rural portion of the population makes up 43 percent of the total, and therefore, has a large interest in the consideration of any national health program.

The Assistant Secretary stressed the fact that rural areas have lagged behind the cities in health and medicine care progress and that the natural advantages of country life therefore have been outweighed. He pointed out that farm youth had higher rejection rates from Selective Service examinations than those from the cities while a Farm Security Administration survey revealed an average of three and one-half significent physical defects in every person examined.

"Despite this burden of preventive illness and premature death," the Assistant Secretary reported, "rural people are provided with less of every type of medical service and facility than are those in the city." Rural sections of America have far inferior public health services, less extensive material and child health activities, and inadequate welfare services for the medically needy. Using many figures and graphic tables to illustrate these points, Mr. Brannan pointed to Title I of the Health Bill, the part in which Federal aid is provided to the States for needed expansion of their public health and welfare activities, as the only feasible solution to these health problems, highlighted in rural areas by their low economic conditions.

The great need for hospitals and health centers in rural communities was a major point, and it was emphasized by the witness that the hospital facilities envisaged in Senate Bill 191, the Hospital Construction Bill, could never be maintained adequately in the economically depressed sections of the country unless nation-wide health insurance also is enacted to afford the medical purchasing power necessary to bring sick people into hospitals.

Mr. Brannon declared that the most crying need in rural America is for doctors, dentists, and other health personnel. He analyzed the serious maldistribution of physicians in the country, showed how the war had aggravated this situation, and indicated that specialists and consultants were practically unknown in many rural communities.

"Although it is generally agreed that the minimum proportion of physicians to population should be 1 to 1000, many farm counties have been struggling with ratios of 1 to 3000, 1 to 5000, and even worse," he said. Mr. Brannan added that the low effective medical purchasing power of rural areas acts as a deterrent to the doctors and stated that a nation-wide health insurance program would provide adequate funds for all needed medical services in every community.

In underlining the farmers' relative hardship in meeting the costs of modern medical care, Mr. Brannan reported that the per capita net income of all nonfarm persons in the United States in 1943 was over two and one-half times that from farming with urban families spending about twice as much for their medical needs. A compulsory prepayment plan covering the entire nation is the only possible method of bringing health care within the financial reach of every citizen.

The Assistant Secretary analyzed the extensive voluntary prepayment plans sponsored by the Farm Security Administration and the Department of Agriculture's Interbureau Committee on Postwar Programs and drew heavily on this experience to indicate the limitations and weaknesses of the voluntary approach to health insurance despite the fact that these plans have been a material step forward for the low-income farmer. Mr. Brannan went on to point out that the other voluntary sickness plans such as the Blue Cross and medical society schemes are "geared to city incomes and to the existence of adequate facilities." The point was made that "where such plans do extend into rural areas the chief reason for low farmer participation is simple—the costs are too high in relation to the services rendered." Mr. Brannan paid tribute to the few rural cooperative hospitals and health associations that function today, but demonstrated their scarcity. Such plans could be expected to find an expanded place under a national health program. Mr Brannan continually stressed that local and even State areas are too often unable to finance for themselves the total health needs of their populations.

"Only a nation-wide plan," he said, "has the actuarial soundness to provide equally comprehensive medical care to those in the cities and those in the country, to the economically insecure as well as to the prosperous."

However, the Department official was definite in his view that the bill clearly specified State and local participation and control of the day-to-day administration of the program.

Finally, the Assistant Secretary pointed to the results of several opinion polls to demonstrate that rural people were coming more and more to demand better health planning.

TENANTS CAN INSURE COTTON CROP

—USDA Photo by Forsythe.

Dr. W. H. Jernagin of the Fraternal Council of Negro Churches is shown asking James P. Davis, right, of the U. S. Department of Agriculture whether or not tenants and sharecroppers, as well as owners, can insure their cotton crop against unavoidable hazards with the Department's Federal Crop Insurance Corporation. Mr. Davis' reply is yes, and he explains that sharecroppers can insure their part of a crop whether the landlord insures his part or not. He adds, however, that the deadline date for insuring the 1946 cotton crop comes within the next few weeks in most areas. Mr. Davis, who is a member of the field staff of the Field Service Branch's Southern Region, and Dr. Jernagin are looking at a miniature bale of cotton.

On the Agricultural Front

Negro Farmers Help Fight Starvation Abroad

The nation's 600,000 colored farmers are joining in the fight against starvation abroad, according to reports received by the U. S. Department of Agriculture from State Extension Service Directors.

In Texas and South Carolina, for example, colored farmers in several counties have pledged to cut down on farm waste; in Georgia, Alabama and Mississippi, they are enlarging their home gardens; in Arkansas and Florida colored homemakers have indicated that they plan to increase their home canning this year, and in North Carolina, colored farm people already have contributed 20,000 cans of food to UNRRA

The need for greater production and conservation efforts was emphasized last week by Secretary Clinton P. Anderson in a statement on the Wheat situation.

"Today's report of about 339 million bushels of wheat in all positions on April 1, reveals a very serious situation with regard to total supplies," he said. "The current estimate is several million bushels below earlier unofficial estimates. . . . We must tighten our belts and fight all the harder to reach our export goals. We must eat less."

Cut Hemisphere Rice Shipments To send more to India and Far East

No rice allocation is recommended for European countries and requirements of the rice-importing areas of the Western Hemisphere have been scaled down by the Combined Food Board in order that all available supplies may be reserved for India, China, and the other rice-eating areas of the Far East.

The Board points out that widespread crop failures, coming at a time when wartime strains have already reduced production substantially, have given rise to a desperate situation. Wholesale famine is threatened in many rice-eating areas of the Far East. Present estimates indicate that Burma, Siam, and French Indo-China, which normally ship about six million tons of rice, will export less than 1,500,000 tons this year.

Potatoes Are Not Fattening

The white potato has been bitterly maligned as a producer of inflated waistlines, according to nutrition experts of the U. S. Department of Agriculture. who recommend the spud as a replacement for bread in the nation's daily diet.

The experts say that it isn't the potato but the company it keeps—generous helpings of gravy, butter and margarine—that cause waistlines to bulge. Nutritionists point out that potatoes are 80 percent water and 20 percent protein, starch, iron, other beneficial minerals. and some B and C vitamins.

From a nutritional standpoint, a small serving of potatoes can replace a slice of bread. A medium sized potato provides about 100 calories, the same as a thick slice of bread. a serving of green peas, sweet corn or lima beans. Many families who are anxious to help relieve starvation abroad are eating potatoes instead of bread in order that more wheat may be shipped to famine areas.

Booklet of Home Freezing

Homemakers who are seeking information on how to preserve fruits and vegetables by the home freezing methods may now obtain an illustrated booklet which gives step-by-step instructions, the U. S. Department of Agriculture announced this week.

The booklet answers such questions as: How to seal different types of containers, how to sweeten fruits and prevent them from darkening, and how long to scald vegetables. It also gives direction for constructing simple home-made equipment to fill and seal packages.

Free single copies of the booklet "Home Freezing of Fruits and Vegetables" (AIS-48) may be obtained from the Office of Information of the U. S. Department of Agriculture, Washington (25) D. C.

Nearly 10,000 West Indies agricultural workers are now employed on farms in the country. the Labor Branch of the U. S. Department of Agriculture reported last week.

About 2,600 Jamaicans and Bahamians were employed in Connecticut, New Jersey, New York, Pennsylvania and Maryland, and about 7,000 were working on farms in Florida. It is estimated that 12,000 West Indies workers will be brought here this year to help with the cultivation and harvest of crops.

Retires After 47 Years Service

Walter Morgan, a colored employee in the Office of Plant and Operation of the U. S. Department of Agriculture. retired for the second time on April 30 after completing a total of 47 years in the federal service.

Prior to his appointment in the Department in 1921, Mr. Morgan had served 22 years in the United States Navy and had retired with the rank of chief petty officer. As an officer in the Navy, he served during two wars—the Spanish-American War and World War I.

Upon Mr. Morgan's retirement from the Department, Arthur B. Thatcher, chief of the Office of Plant and Operations, commended him for his years of service to the Department and presented him a token from fellow employees.

Long Range Calendar

March 2-10-National 4-H club week; in March and May, Spring Cleanup Weeks, picked by States; May 3-5-Institute of Education by Radio, Ohio State University; May 26-4-H Club Sunday; June 7 or thereabouts, 4-H Club Camp at Washington, D. C.; July 21-27, National Farm Safety Week; Oct. 6-12, National Fire Prevention Week; Nov. 2-10, 4-H Achievement Week; Dec. 1-5, National 4-H Club Congress.

A Popular All-Season Crop, Broccoli Earns Ample Space

By Dr. Floyd Bralliar
Garden Editor,
The Nashville Tennessean

The popularity of broccoli is growing every year. It has only been a few years since most of us saw it for the first time on the vegetable counters of a few of our most progressive groceries. The public in general liked it but even then the general opinion was that it could not be grown here. A few tried it and found that it is very easy to grow. Now a good percentage of our progressive gardeners grow it.

Broccoli takes space, but as it is an all season crop it earns it. A dozen or so good plants set the distance apart as cabbage will furnish the average family all summer and till early winter. Give it rich soil and good cultivation and it will do the rest. At this season it is best to plant it where it is to grow and thin to a single plant in each hill when it is well up.

Collar Helps Cabbage

Where cabbage is or has been troubled with maggots, put a collar of tar paper around the stems from an inch below the top of the ground to three inches above and leave it there. This applies to cauliflower and broccoli as well.

All of the cabbage family crops require rich soil to do well. if any of them are not doing well, side dress them with a spoonfull of a good nitrate fertilizer hoed in an inch deep and two or three inches from the plant.

As fast as one crop is harvested plant another in its place. This is not only economy of effort and space but preserves the fertility of the soil. Soil that is bare loses its fertility.

Delay Watering Plants

Do not be in too great a hurry about watering either your lawn or your garden. Wait till the plants are actually suffering for water.

Deep rooted plants do the best and plants do root more deeply when they need more water than when they find all they need in the surface soil. When you do water use enough to thoroughly wet the soil a foot deep, and then work the soil an inch deep as soon as it is dry enough to work.

As fast as the very early vegetables are harvested plant more lima beans or peas for use green as well as for use dry next winter.

4-H Boy's Champion Calf Brings $1,000 At Sock Show

A champion Hereford calf raised by Willie Jones, a 4-H club youth of Sumter County, Alabama, brought a total of $1,100, including prizes, at the Montgomery, Alabama, Livestock Show recently.

The calf weighed 970 pounds and sold for $1.01 per pound. In addition, his owner was awarded over $100 in prize money for exhibiting the grand champion.

The youth's father, Carrol Jones, was acclaimed the farmer of the year at Tuskegee's annual farmers conference last December.

Dr. J. R. Otis, State Leader of Extension work among colored farmers, says that increased emphasis is being placed on livestock production in Alabama as a means of helping to round out a balanced farming program. The idea, he says is to get farmers to stop putting all of their eggs in one cotton basket.

There are 35,000 colored 4-H club boys and girls in Alabama. Most of them are said to be carrying livestock, poultry or garden projects.

Teachers Praise Soil Conservation

The 47th annual session of the Arkansas State Colored Teachers Association which met in Pine Bluff, Ark., recently praised the soil conservation work being carried on in the State by colored farmers. The association stressed the importance of conserving our soil resources in order to produce better crops and raise the standard of living.

Spring Conclave

By this time, most of you have received official word from President John Strohm that the spring vacation meeting of farm paper editors and writers will be held May 12-17, beginning at Washington, D. C. and winding up at New York City. The plan is to have everybody get into Washington if possible by Sunday night, May 12, and be ready to pile into the autos Ernest Moore and the ARA staff will provide early Monday, May 13, for a trip to the research demonstrations at Beltsville, Md.

Two days, Monday and Tuesday, will be devoted to Beltsville projects, with the details forthcoming soon. On Monday evening there will be a dinner party in Washington, with some select speakers and perhaps some open discussion. Remember that this is your party and the staff is going to make it the best ever as an overture to peacetime farm journalism.

Forty-seven per cent of the counties of the United States lack airport facilities.

Many Changes Made By Cheese Producers In Last Three Years To Improve Ratings

More than 24,000,000 pounds of cheese were produced in Tennessee in 1945. The cheese industry in the state has continued to grow in both size and quality of product. Today Tennessee ranks tenth in the United States in the production of cheese. This industry has made available markets for milk in areas where it was impossible to sell it for raw consumption. It has provided a cash income for many farmers blessed with large pastures suitable for grazing, but lacked a market for their milk.

Not only is Tennessee producing a large quantity of cheese but the percentage of No. 1 cheese is high also. However, the quality of Tennessee cheese has not always been as high as it is today according to L. S. Edwards, dairy manufacturing specialist.

Edwards said the percentage of cheese grading No. 1 is much higher today than it was three years ago. Figures are not available on all cheese produced in Tennessee, but that graded under government standards was 85.4 per cent No. 1. In 1943, the percentage of first class cheese was only 70.5.

Edwards termed this as a "great improvement." Many plants found that in order to improve their product, it would be necessary to change methods of processing. In order to produce cheese that would meet government requirements, many plants adopted an eight-point program. The program included (1) quality milk, (2) complete pasteurization, (3) controlled starter, (4) procession cheese making, (5) cleaning program, (6) dry floors, (7) insect and rodent control and (8) factory analysis.

To carry out this program, many plant managers found it necessary to rearrange the entire plant and to make many changes in their processing methods.

It is hard to believe that whole milk can be processed into a yellow "hunk" of cheese in a few hours, but that is what happens at a cheese plant. However, it really isn't cheese until after it has been cured for a few months.

The first step in processing milk into cheese is pasteurization. The milk is heated to 164 degrees and cooled. It is then run into large vats which hold more than 10,000 pounds. The "starter" is added to the milk in the vat which is continuously stirred for one hour. The stirring prevents the butter fat from rising to the top. At the end of the first hour, rennet is added for the purpose of coagulating the milk. This process requires 20 to 30 minutes. The coagulated milk is then cut into small bites. For a period of 30 minutes, the milk is heated to 104 degrees. The purpose of this heating period is to separate the curd from the whey. After two and one fourth hours from the time the milk first enters the vat the whey is drained off from the curd. About one tenth of the original weight of the milk remains in the vat as curd.

The curd is packed about 12 inches deep in the vat and allowed to set for two hours. After this it is cut out in large slices and passed through a process called milling, where it is cut into small pieces. Salt is then added and the cheese is packed into presses. This is the process used in making American cheddar cheee.

Many wonder why they are unable to purchase good cheese in the past few years. The main reason is the greater part of our No. 1 cheese has gone for government purposes. The cheese that does reach the local markets is usually too fresh to be very good. cheese should be allawed to ripen at least two months, but due to the limited supply most of our cheese is only a few days old.

A nationwide 50-city price tabulation shows the service station price of gasoline to average 20.21 cents a gallon including an average tax of 6.05 cents.

USDA Backgrounds in Grain, Food and Feed Situation

Attitudes of the Department official toward certain points in the world wheat and food relief problem are given here for your information. Some of the statements of Secretary Anderson given at a press conference Feb. 8 are drawn upon, but not directly quoted.

The proposed order called for 80 precent wheat bread is not nutritionally injurious to consumers. In fact, the British credit an even higher (85 percent) extraction rate for part of the decided improvement in the growth rate of their children during war years. Claims of some of the millers that were taken unaware by Government decision to require a greater wheat extraction for flower is hardly a fair statement because phone conversations and other discussions with trade representatives had already taken place. On Monday, Feb. 11, the advisory committees for the bakers and millers came to Washington for a conference when they were given opportunity to set forth their views. One instructive revelation was that an 85 per cent rate had been planned, but it was cut back to 80 with the thought that that was what the industry could live with. It is believed, moreover, that the brewers and distillers, had they been consulted beforehand, would also have advised against reducing domestic use of grain.

To get wheat for export relief feeding is the sole purpose behind the bread order. This country has determined to stand by its original purpose to send 225 million bushels of wheat abroad during the first 6 months of 1946, but no exact monthly quotas for different countries are set. The program thus may be kept flexible.

Officials, studying the feed supply all fall, were particularly concerned about the soft corn situation in relation to other grains. Nevertheless, it would have been premature to talk scarcity before the true reserve stocks picture came to hand about January 28, 1946.

The entire situation is further aggravated by the reduced world supply of rice. Many millions of people in Southwest Pacific zones and in China and Japan depend mostly on this cereal, to the same extent that Europeans rely upon wheat and rye. Some rice will be available for export from the United States to help feed these people. Great Britain has cut out its entire rice imports. The program calls for the domestic distribut- of rice, primarly in 13 States where it is most commonly used, under the supervision of the rice industry.

In considering the situation, three commintments which have been made by the Government should be noted. The primary point is that they all cannot be readily kept under present circumstances, without the emergency wheat program. These commitments are (1) not to alter the ceiling price on hogs; (2) not to raise the ceiling price on corn; and (3) to export at least 225 million bushels of wheat.

This dilemma presented itself when all reserve grain stocks here were found to total only 689 million bushels as of Jan. 1, compared with 835 million bushels year ago, plus the widespread prevalance of high moisture soft corn of inferior feeding quality and the ever present difficulty of supplying adequate railroad transportation.

Along with this, there had been a 37 per cent increased disappearance of wheat in the final quarter of 1945 over that of 1944, with a much heavier remand for all types of feed, particularly for poultry which tightened up the picture. The Department feels that it is unfair to blame the wheat scarcity upon the farmers, who have been accused of holding wheat for higher prices. Many elevators are full to capacity (estimates place plugged elevators at 1,000) and box cars are not available in sufficient numbers to clear them out for new consigments.

Greater movement of grains from leading production centers to deficit areas is suggested to relieve the worst shortages and where liquidation of livestock and poultry would work hardship. How to induce movement of any available surplus of farm grain to be sold for feeding purposes elsewhere is the question. The Department spokesmen do not favor a straight out price increase to accomplish this. Under customary methods of handling wheat, this cereal is not usually bought and sold in the black market channels, while corn is more easily adopted to bartering and out-right black market trading.

An increase in wheat prices would give notice quickly that other wheat price increases could easily follow. The balance of successive wheat plantings could be upset in periods after the crisis is past, and in this connection the warning that Dr. Howard R. Tolley, BAE chief, has issued at Des Moines is of interest.

However, the main point to bear in mind in considering the immediate disadvantage of a price increase is that, insofar as wheat growers are holding back stocks, they would continue to keep back their holdings for another rise.. In any event, farmers have not shown a widespread, over-riding tendency to refuse to market their crop. As a matter of fact, an inadequate supply of box cars is a much more pressing problem. The question very well could be: How can farmers deliver to plugged elevators? The Department is aware of the various factors in the situation.

Some discussion has centered, however, around a proposal to adjust ceilings and support prices so as to discount the marketing of heavyweight hogs and thus save on grain and protein supplements. A marketing program of that kind, raising ceilings on hogs of less than 225 pounds and lowering them for weights over that figure, is a possibility, but it has not yet taken specific shape. Government representatives have talked it over with pork producers. The idea would seem to be that feeding of hogs beyond 225 pounds ought to be discouraged. Heavyweight porkers, therefore, should be cleared out as fast as markets can take them without a price-reducing glut. At least, such clearance would safeguard producers from finding themselves with heavy hogs on their hands, if the ceiling is lowered. Farmers should avoid a marketing stampede but in electing to sell, ship the larger hogs. Some such objective may be sought, using the common average market weight of 225 pounds as a turning point.

Some market observers, however are inclined to hold to present ceilings in the expectation that difficulties in obtaining feed would result in a movement of the heavier animals.

The original purpose in the encouraging fat-hog marketing was to add to the fats and oils supply. An assurance not to take action to reduce prices on hogs until Sept. 1, 1946 was given early last year. But the Government is inclined to believe that it would be better, if necessary, to break that pledge than to let people abroad go hungry as long as the average income from hog production is reasonably well maintained. An added suggestion points to a possible set-aside program that would move into cold storage any excessive livestock marketing.

More than four million home oil burners now are in use in the United States, all of them placed in service after 1920.

"Fight Famine" Highlights

(Some Releases Reviewed)

LESS GRAIN FOR ALCOHOL—No wheat or wheat products and no No. 1, 2 and 3 grade corn may be used for beverage alcohol manufacture during March, April and May. Amounts of other grain equivalent to 55 days' mashing capacity may be used, with the exception that the rye used may not exceed 6 per cent of the total of each distiller's grain allowance, or a limit of 2,000 bushels, whichever is greater.

RICE ALSO DOWN — OFAR world reports show a total rice production of 6.2 billion bushels for 1945 46, which is 10 per cent below last season. Huge slashes in ricc output are reported in the heart of Asia, especially in the Japanesc occupied zones. More help must come, therefore, from America, where the rice crop in both continents is somewhat higher.

SET ASIDES RESTORED—Federally inspected meat packers are setting aside, under USDA orders, 7½ per cent of the live weight of hogs killed each week, and the set aside for lard they produce has been jumped from 3½ to 5 per cent of live weight of hogs slaughtered. Only 11 States with small production are excused from the order.

GRECIAN OIL EXCHANGE—In return for the release of 3,000 metric tons (2,204.6 lbs to ton) of soybean oil exported to the Greek Government under Commerce Department license and subsidy clearance by CCC, a like amounted of Grecian olive oil will be imported to this country. Similar exchanges may be arranged with other countries to permit soybean oil exports in limited volume when olive oil is forthcoming in return.

INTRODUCING 80 PERCENT FLOUR—The President's order calls for a flour made of 80 percent of wheat, but British flour has called for 85 percent during most of the war years. Calcium was added to this flour by the British, but no need for this is anticipated in the United States where supplies of milk and milk products and green vegetables are so plentiful.

Many people know how important bread and grains are for their energy value. They contribute more than a quarter of the calories and protein in the national diet. This amount of protein is almost as much as that from meat, poultry, game, and fish combined, though this protein is of poorer quality unless it is eaten with milk, meat, eggs, or other high quality protein foods.

If present levels of enrichment of flour are maintained, the new 80 percent flour will give these same B vitamin values and in addition improve the protein quality. The 80 percent flour unenriched does not have as much thiamine, riboflavin niacin, and iron as the present enriched white flour.

USDA BAKERY BUSY— Using the proper formulas for 80 per cent extraction flour ground in the mills and baked in the laboratory of the Grain Branch of PMA at Beltsville, Md., several trial loaves of this new "hunger fighting" bread wore submitted to President Truman and high Government officials last week.

As a simple example, it is pointed out that if a housewife mixed one cupful of whole wheat flour with two cups of white patent flour the resulting mixture would just about equal the color and composition of the 80 per cent flour aforesaid.

GERMAN FOOD IMPORTS—In 1938, the last full year of versified data, Germany imported 1,267,600 metric tons of wheat (about 48,55 million bushels at 2,204 lbs. to metric ton) about 455,300 tons of barley, 1,895,400 tons of maize and 275,600 tons of rice, as well as 137,500 tons of meats, 92,200 tons of butter and 32,500 tons of cheese. This is from Department of ommerce report.

PROCEDURE IN TREATING INFECTIOUS MASTITIS (From BAI)

Part of supplement just issued to FD. 1422:

"Before attempting chemotherapeutic treatment in an infected herd, the following procedures should be followed. Quarter samples of milk from each cow, aseptically obtained, should be submitted to a bacteriological laboratory to identify all infected cows in an infected herd may give temporary relief insofar as these particular cows are concerned, but will do little towards solving the problem of mastitis. Cows having severely diseased udders, as evidenced by hardening of the udder tissue, are poor risks for treatment because they do not respond readily to drug therapy and seldom prove to be economical producers even if the infection is climated. Such cows may be detected by having a veterinarian experienced in this type of work make a physical examination of the udders.

"Following identification of all infected cows and the elimination of cows which are found to be too seriously diseased to warrant treatment, the herd should be divided into healthy and infected groups and milked separately, although the two groups may be stabled in the same barn if necessary. It is at this stage of the program that considerable saving in time, animals and expense may be gained by the use of drugs to treat each infected quarter. Treatment consists of injecting a solution of a drug into the infected quarter through the teat canal. As conditions on different dairy farms vary considerably, it is impossible to make definite recommendations regarding the drug and dose which would be most suitable for use in each herd. Your local veterinarian will be in a position to suggest the drug and dosage which will be most likely to give the best results. He will, also, give advice regarding the collection of milk samples and where they may be sent to be tested. As none of the drugs being used at the present time are effective in curing all cases of mastitis, it is desirable to have a second bacteriological examination made of the milk following the first treatment or which did not respond favorable may either be retreated or eliminated. It should be emphasized that cows that have been freed from udder infection may become re-infected if the infection remains in the herd or on the premises. After a herd has been shown by test to be free from infectious mastitis, it is advisable to have a re-test made several months later as insurance against the possible recurrence of the infective organism in any of the animals. No replacement animal should be added to a herd until the milk from all 4 quarters have been examined bacteriologically and found free from infective organisms.

"It must also be understood that drug therapy is by itself only a helping factor. The ultimate success of any treatment for this disease depends in great part on the willingness and ability of the herdsmen to pay strict attention to the employment of recognized sanitary practices in milking and handling the herd, and the protection of the cows from sources of infection and injury to their udders."

SHOW STOCK MINUS PRICE CONTROL—OPA regulations exempt from all price control the sales of cattle, calves and hogs which have been shown at a recognized exhibition, provided the sale is held at the same place and during the show program.

TWO NEW ISSUES—A graphic summary of the agricultural resources and geography of the Philippines has been published by Office of Foreign Agricultural Relations, free temporarily upon request at Office of Information. Many ways to serve and season fresh green vegetables are found in leaflet AIS 3, revised and rewritten.

Bots Film Praised

"If you were to see the USDA film on bots you would surely want to go to the defense of the horse," says Pacific Rural Press. This noted film was shown at the Annual Conference of the California Extension Serrvice at Berkeley, conducted by Kenneth Mc Kay, extension veterinarian. The original was made by USDA motion picture section in the Office of Information, under technical direction.

Projects Bring Steady Income

Last year the Kirksey family of the Dollar Hide Community, Greene County, received $350 from about 700 broilers which they raised in lamp brooders.

This year the Kirkseys are planning to raise more chickens for market and have built two more lamp brooders. They are planning to raise more feed for their chickens in order to cut the cost of growing them.

From 35 pullets enough eggs are gotten for the family of eight and ten dozen are sold each week to the Eutaw high school.

In addition to selling poultry products the Kirkseys are selling vegetables and milk. From last October to this April, they received $385 from milk and vegetables. Most of this money was used to repair and paint their house.

By selling poultry, milk, and vegetables, the family will have a steady source of cash income during the year. They are now making plans to put running water in the house with the income from milk, poultry, and vegetables.—NEGRO FARMER.

Forty Year Loan Paid in Five

W. M. Ross is the first Negro farmer in Chambers County to complete payment on his farm and home under the Bankhead-Jones Tenant Purchase Act.

In 1940, Ross made an agreement with the Farm Security Administration for the purchase of a 160-acre farm. He was given 40 years in which to pay a $3,170 loan.

Through careful planning and hard work, he grew enough food for home use and some for market. He sold cattle, hogs, cotton, chickens, eggs, and also timber from his 60 acres of woodland to help pay his debt.

At a recent meeting FSA officials presented the deeds to Mr. and Mrs. Ross.—NEGRO FARMER.

Milk Brings Income on Marengo County Farm

Good management and careful planning have made dairying a major cash source of income for Mr. and Mrs. Williams Juniors of Marengo County. Last year they sold $2,460 worth of milk as compared with $940 worth of cotton.

The Juniors decided to sell milk after they had attended a milk production meeting in 1944. They rented 60 acres of land from their landowner to provide four acres of grazing per cow. As a part of his feeding program Juniors uses Caley peas followed by Johnson grass and oats followed by Johnson grass.

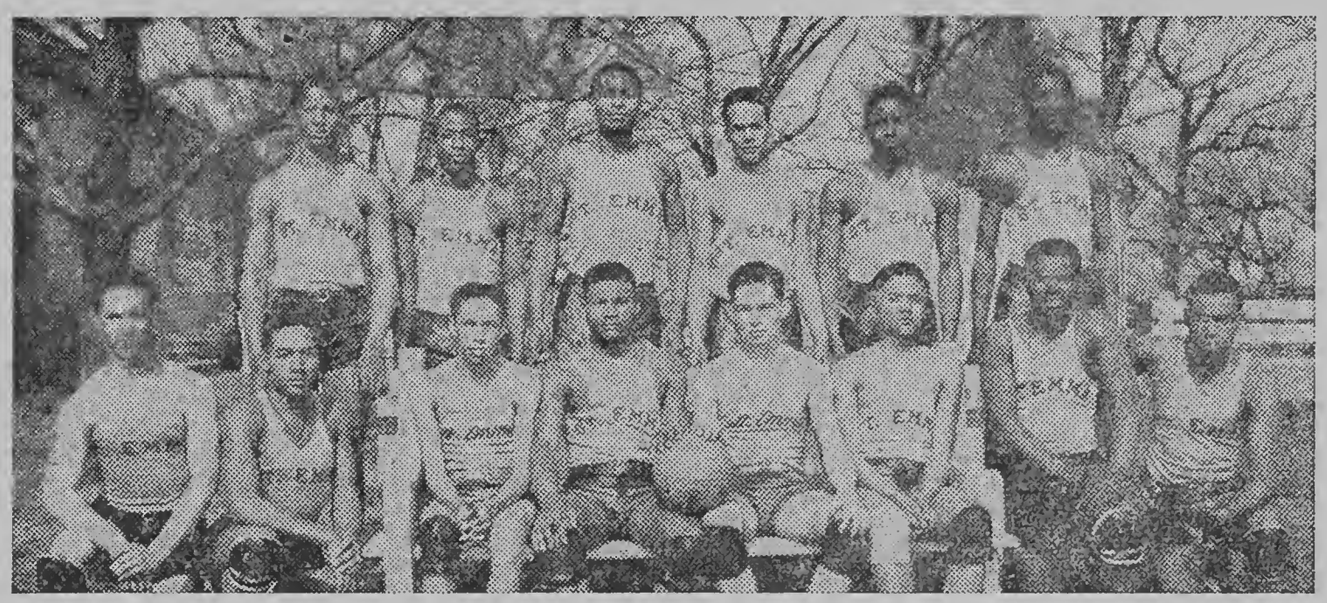
For the past two years, the Juniors averaged $112 per month from milk, as compared with $32 per month from cotton. This year, they plan to increase their milk production by properly culling and managing their herd. Juniors said, "Selling milk was first a side line to supplement my cotton, but now, cotton is grown as a side line to supplement milk."—NEGRO FARMER.

Garden Seed Saved For Planting, Sale

Mrs. Lucy Ann Howz of Hopewell Community, Perry County, saved enough vegetable seed from her garden last year to plant a garden of one and one half acres this year. She also had surplus seed to sell to her neighbors. With this money she bought other seeds which she did not have.

Already she has planted 10 different vegetables. "I did not sell any vegetables last year because I knew my family of 13 needed fresh vegetables every day. I did not have to can very much vegetables because of my year round garden. With fresh vegetables, canned foods, chickens, fruits, and other home-grown products, I am able to serve well balanced meals."—NEGRO FARMER.

St. Emma Military Academy Trojans



ROCK CASTLE, VIRGINIA. This year the St. Emma purple and gold varsity basketball team resumed its visits to Richmond, Petersburg and Charlottesville to take part in the Virginia District and State Tournaments. Shown in the photograph, front row, left to right, are Capt. Francis Barial, age 17 (Mississippi); Capt. Cecil Best, age 17 (Connecticut); 1st Lt. James Miller, age 18 (Oklahoma); 1st Sgt. Plater Campbell, age 17 (District of Columbia); 1st Lt. Harrison Hairston, age 17 (Ohio); Cadet Phillip Holland, age 16 (Alabama); Cadet Daniel Wilkins, Jr., age 15 (Virginia), and Cadet Leroy Barton, age 16 (South Carolina). Back row, Cadet David Brown, age 16 (Florida); 1st Sgt. Raphael Smith, age 18 (Connecticut); S/Sgt. Burdette Campbell, age 16 (District of Columbia); Cadet Walter Lisby, age 15 (Pennsylvania); Capt. Wilbur Clarke, age 17 (New York), and Cadet James Yates, age 16 (Virginia).

Processing of Food for Freezing Important Home Economist Says

Much of the food processed for freezing is improperly handled before it is put into frozen food lockers, Mary Love Stegall, home economist for the TVA, said this week. "We can't expect to take better food from our lockers than we put into it," she said.

Miss Stegall emphasized many points which are essential in preparting food for freezing. Among those mentioned were: the selection of the products, handling, processing, picking and cooking.

Fruits and vegetables must be at a stage of maturity most desirable for use as fresh products. The meats that are frozen should be from correctly slaughtered animals, and the carcass should be chilled as quickly as possible after slaughtering. It was pointed out that many people allow fruits to become bruised or they waste too much time in getting it to the locker after it is taken from the tree or vine.

Too many people think that freezing is all that is necessary around a frozen food locker. Selection and handling of the food before freezing is of major importance, as well as packing. All foods intended for freezing should be in air tight packages and as much air as possible should be removed from the packaged products. Miss Stegall pointed out that there were many types of papers and containers on the market for locker plant use. Some of these are good but many are undesirable. Locker plant managers can and should supply the approved type of material.

Cooking a frozen food is another important matter, she said. Plenty of literature is available and will solve this problem if the housewives will make use of it, she declared.

Five points given in favor of frozen food were:

1. Allows for a variety of fresh nutritious foods through the year.
2. Requires less work in processing.
3. Eliminates spoilage.
4. More value for money invested.
5. Allows for consumption of home grown products.

"The person who gets the most value from his frozen food locker is the one who makes the greatest use of it," Miss Stegall said.

Salt, Water Prevent Overheating of Horses

Overheating of horses and mules can be prevented by giving them all the salt they want, and plenty of water throughout the day, according to the Kentucky College of Agriculture and Home Economics. It is suggested that a barrel of water be taken to the field so horses can have a drink every hour during hot weather.

Mature horses doing ordinary farm work should be fed about a pound of grain and a pound of good, bright, clean hay per 100 pounds of weight per day. Yellow corn is recommended for half of the grain, along with one feed of good alfalfa hay. When the work is hard, the amount of grain fed should be increased. Many farmers turn their workstock on pasture at night and on days when not working.

Kentucky Farmer's Profit From Hens Surpasses Tabacco

From a flock of 460 New Hampshire hens, Phillip Depp of Metcalfe County, Kentucky, made more money during the month of December last year than he cleared from his four-acre tobacco crop. By starting with certified quality chicks and following a good summer feeding program, he brought his pullets into production early, thus giving him the benefit of high prices, according to County Agent William Newman.

Depp started 1,100 chicks on April 13 with an electric brooder, and lost only 3 per cent. For 12 weeks he fed a commercial starter and grower. Then the pullets were put on a range of rye grass, crimson clover and rape, and self-fed grain and oyster shell supplemented with half as much mash as grain.

Ten days before housing, which was not until November 1, because of construction difficulties, Depp put his flock of 500 pullets on a full feed of laying mash. From mid-November, electric lights burned all night, resulting in 75 per cent production which has been maintained steadily with the birds in good health and condition. During the months of December and January, average production per hen was 24.7 eggs.

Pasture, Roughage for Dairy Herds Strongly Urged

Greater use of pasture and roughage for dairy herds is strongly urged by Secretary of Agriculture Clinton P. Anderson who has called for every effort toward maintaining a high level of milk production.

"Demand for dairy products is now considerably higher than it was before the war," Secretary Anderson said. "This high demand calls for the highest possible production during the next 12 months. Increased use of pasture and roughage will help maintain production and conserve grain urgently needed to prevent starvation in other countries."

Latest reports show that milk production is currently two or three per cent under last year's production, and below the level needed to achieve the 1946 goal of 102.8 billion pounds. On a per capita basis, civilian and military, production is at about the same level as in the early thirties, when the national income was at one-third the present level.

Dairymen in their efforts to supply the urgent demand for dairy products in the face of limited feed concentrate supplies, have an advantage in that about two thirds of all nutrients consumed by milk cows comes from roughage such as grass and hay records of the dairy herd improvement associations show that herds which maintain the best production during the critical months of late summer are those where the best provision is made for summer pastures.

Plan Now

To treat sheep for stomach worms and to keep salt and phenothiazine before them all summer. A mixture of one pound of phenothiazine with nine pounds of salt will control the worms.

To vaccinate all young cattle for blackleg.

To provide plenty of fresh water for all livestock. Water is much cheaper than feed.

To set only your alloted acreage to tobacco. It will be much easier to leave the plants on the bed this spring than it will be to pay a heavy penalty on the crop next fall.

To paint your name on your mail box, if it is not already there.

Alabama Farmers Establish Co-Op

Seven months ago 12 farm families of Marion and rural communities of Perry County organized a cooperative association to help them market their surplus farm products. Each family paid $550 into the co op.

Since organizing, the number of families has grown to 60. After $3,000 had been paid in, members begar to work out a paying project. They are now operating an up to date cafe, a soda fountain, a large grist mill, and a grocery store. Plans are being made for a curb market. The farmers are selling their corn through the grist mill and store for $2,40 per bushel. They also get corn from farmers who are not members of the co op. This paying enterprise is owned by farmers and operated by their wives and hired help. It is serving the public well.—NEGRO FARMER.

Home-Made Soap Recipes Are Offered

Adolphus, Ky., April 27—(Spl.)—Mrs. J. B. Hinton, Adolphus, Ky., read with much interest the article about making ash lye soap which was recently published on the BANNER farm page But, recalling some of her own experiences in testing the soap mixture with a feather, she says the feather, when it fails to strip off right, does not indicate how much lye or grease should be added.

Also, she said, "old fashioned soap makers are born and not made."

Here is her favorite recipe for home made soap: To one 13 ounce can of concentrated lye, pour one gallon of water into iron kettle. Dissolve the lye, add 4 pounds of grease and 2 tablespoons borax. Let boil for at least one half hour until it thickens. Cool, cut out the white cakes and pat away to dry; dip out the brown jelly-like soap in bottom of kettle and use to dissolve in hot water (for scrubbing out brooder houses) or for any cleaning purposes for which the ash lye soap would be used.

If bones are used in soap making, dissolve three 13 ounce cans of lye in three gallons of water, add from 15 to 20 pounds grease, according to the amount of bones used: let boil until it thickens, then cool and take off top. Throw away waste matter in bottom of kettle. Pour in one gallon of water and one can of lye; add the lye and grease mixture that had just cooled, and let boil until it thickens. Finally, cool, cut out into cakes and store away where they can dry.

Cold water soap seems to be one of the easiest methods to make soap. Here is Mrs. Hinton's favorite recipe: To one 13 ounce can of lye dissolved in 1 quart of soft water that has been boiled and cooled down to luke warm, pour enough melted grease to fill a half gallon syrup bucket to within one half inch of the top. Both the dissolved lye and the melted grease should be luke warm.

This mixture should be poured into an enamel vessel. Stir constantly until it becomes thick Then set in a cool place for an hour or so, cut into cakes and put away to dry.

To Help Veterans Get Farm Machinery

Through a recent amendment made to WFO 135, USDA has taken steps to clarify the procedure by which veterans may get farm machinery. There are 16 groups of machines on which preference to veteran farmers may be granted, and the order is administered by the Materials and Equipment Branch of PMA.

According to the amendment a "veteran's preference certificate shall become void, unless presented to and accepted by a dealer within 15 days after the date of the issuance" by a County Agricultural Conservation Committee. The amendment also provides that a certificate expires 60 days after issuance. It, however, may be extended when necessary by the county committee for additional 60 day periods "upon a written request by the veteran stating the reasons why the extension is required."

Certificates issued prior to the effective date of the amendment will become void in 30 days if not filed with dealers. Certificates issued prior to the effective date of this amendment and on which farm machinery has not been delivered within 60 days will expire unless extension is granted by the county committee.

A dealer may, if he so elects, according to the amendment, fill an order on a certificate from equipment on hand. "If the dealer does not so elect, the preference to which the veteran is entitled by reason of the certificate applies to the next item of like equipment received by the dealer, or received by another person for the dealer's account, after the presentation of the certificate to such dealer." No dealer is required to honor the certificates of a veteran who is unwilling or unable to meet the regularly established price and terms of sale and payment.

WOMAN'S PAGE

A FAMILY PLEASING DINNER THAT'S NICE ENOUGH FOR COMPANY

Ham Slices (or hocks) and Greens, Carrots, Cucumber Tomato Salad, Peanut Butter Corn Bread,* Fresh Fruit and Blue Plate Coffee.

*PEANUT BUTTER CORN BREAD

¾ cup sifted flour
1½ cups yellow corn meal
1 teaspoon salt
3 teaspoons baking powder
2 eggs, well beaten
1½ cups milk
¼ cup melted fat
1 3 cup New Blue Plate Peanut Butter

Sift dry ingredients. Add beaten eggs and milk. Blend melted fat with Blue Plate Peanut Butter. (It's smoother than ever, richer in flavor). Stir into first mixture. Pour into hot, well greased pan and bake in hot oven 20 minutes. Serves 6.

BAKED PEAR HALVES WITH LEMON SPICE SAUCE

6 canned pear halves
1 cup corn flakes
1 tablespoon butter or margarine

Roll fruit in corn flakes which have been crushed into fine crumbs. Place in buttered baking dish, cut side up. Dot with butter. Bake in moderately hot oven (400 degrees) about 25 minutes. Serve with Lemon Spice Sauce.

Lemon Spice Sauce

½ cup sugar
1 tablespoon cornstarch
1 cup fruit juice
2 tablespoons butter
1½ tablespoons lemon juice
⅛ teaspoon nutmeg
⅛ teaspoon salt

Mix sugar and cornstarch together. Add fruit juice gradually and cook, stirring constantly until sauce is clear and slightly thickened. Add butter, lemon juice, nutmeg and salt. Serve over hot baked fruit.

Grated horseradish added to white sauce and served with fish is excellent.

PRUNE PIE WITH COTTAGE CHEESE

3 cups pitted, cooked prunes, unsweetened
¼ cup sugar
2 tablespoons cornstarch
Few grains salt
¾ cup prune juice
1 tablespoon lemon juice
2 teaspoons butter

Drain prunes. Mix sugar, cornstarch and salt. Stir in prune juice gradually. Cook in saucepan, stirring constantly until thickened and clear. Add lemon juice and butter. Stir in prunes. Pour into 9 inch baked pie shell. Cool. Top with spoonfuls of cottage cheese.

MUSHROOMS IN SPINACH RING

1 pound spinach
½ pound mushrooms, sliced
3 tablespoons butter, melted
¼ cup sifted flour
1¼ cups milk
Salt and pepper

Pick over and wash spinach; put in large cooking pan. Sprinkle with salt. Cover tightly. (Water which clings to leaves is usually sufficient for cooking.) Cook until just tender. Drain well. Press spinach into small heated ring molds.

Cook the sliced mushrooms in the butter in tightly covered pan about 5 minutes over low heat. Place over boiling water. Add flour. Mix well. Add milk all at once and cook, stirring constantly until thickened. Season with salt and pepper. Turn spinach out on heated platter. Fill center with mushrooms. Three or four servings.

TO MEASURE LIQUIDS

When measuring liquids use a cup which has a space above the one cup line. This will prevent spilling and it will avoid the tendency to skimp on measurement. Place on a level surface at eye level, if possible.

BRAN SHORTCAKE DOUGH

½ cup bran
¾ cup buttermilk
1½ cups sifted flour
1 teaspoon baking powder
2 teaspoons butter
½ teaspoon soda
1 teaspoon salt
2 tablespoons sugar
½ cup shortening or margarine

Soak bran in buttermilk. Sift flour, baking powder, soda, salt and sugar together. Cut in shortening until mixture is like coarse cornmeal. Add soaked bran; stir until dough follows fork around bowl. Turn out onto lightly floured board. Pat into two layers. Place one layer in greased round pan; spread with softened butter. Cover with remaining layer. Bake in hot oven (450 degrees) 20 25 minutes.

NOTE: If sweet milk is used instead of buttermilk, omit soda and increase baking powder to 3 teaspoons.

VEAL TIMBALES WITH CURRY SAUCE

1½ cups ground cooked veal
4 tablespoons butter or fortified margarine
4 tablespoons flour
2 cups milk
1 teaspoon salt
2 eggs
1 lemon
1 tablespoon minced onion (optional)
1 teaspoon salt
½ cup curry powder

Melt butter in top of double boiler and stir in flour until smooth. Add milk and salt and cook until thickened. Let sauce stand over hot water.

Separate eggs and beat yolks slightly. Grate lemon rind and squeeze out juice. To ground veal and yolks, 1½ cup of the white sauce, 1 tablespoon lemon juice, onion, and salt. Beat egg whites until stiff and fold into the meat mixture. Bake in greased individual custard cups in moderately low oven (325 degrees F.) about 25 minutes or until set.

To hot white sauce add curry powder and 1 tablespoon lemon juice. Unmold timbales and serve with curry sauce. Sprinkle grated rind on top of each timbale.

SUBSTITUTES URGED TO SAVE FOOD

Washington, May 1—(AP)—How's your conscience today? A starving child's next meal may depend upon it.

For Americans who want to help hungry millions of their fellow men abroad, there are definite, everyday ways to do it.

Here are some, suggested by the Agriculture Department's Bureau of Home Economics:

Wheat is the No. 1 cereal for shipping abroad, rice is urgently needed in the Far East. In place of wheat and rice, use oatmeal and cornmeal when possible.

If wheat and meal foods are scarce, substitute second helpings of potatoes, carrots, turnips, corn, peas or lima beans.

Use oatmeal occasionally to replace part of the wheat flour in making bread, biscuit, muffins, pancakes, cookies.

An average serving of oatmeal, before sugar and cream are added, equals about two slices of bread in food value.

Use leftover, cooked oatmeal as thickening for gravies, soups, stews, in place of breadcrumbs in meat loaf or in making fruit bet ties and puddings.

When cornmeal is plentiful, use it in cornbread, muffins, griddle cakes, corn meal mush.

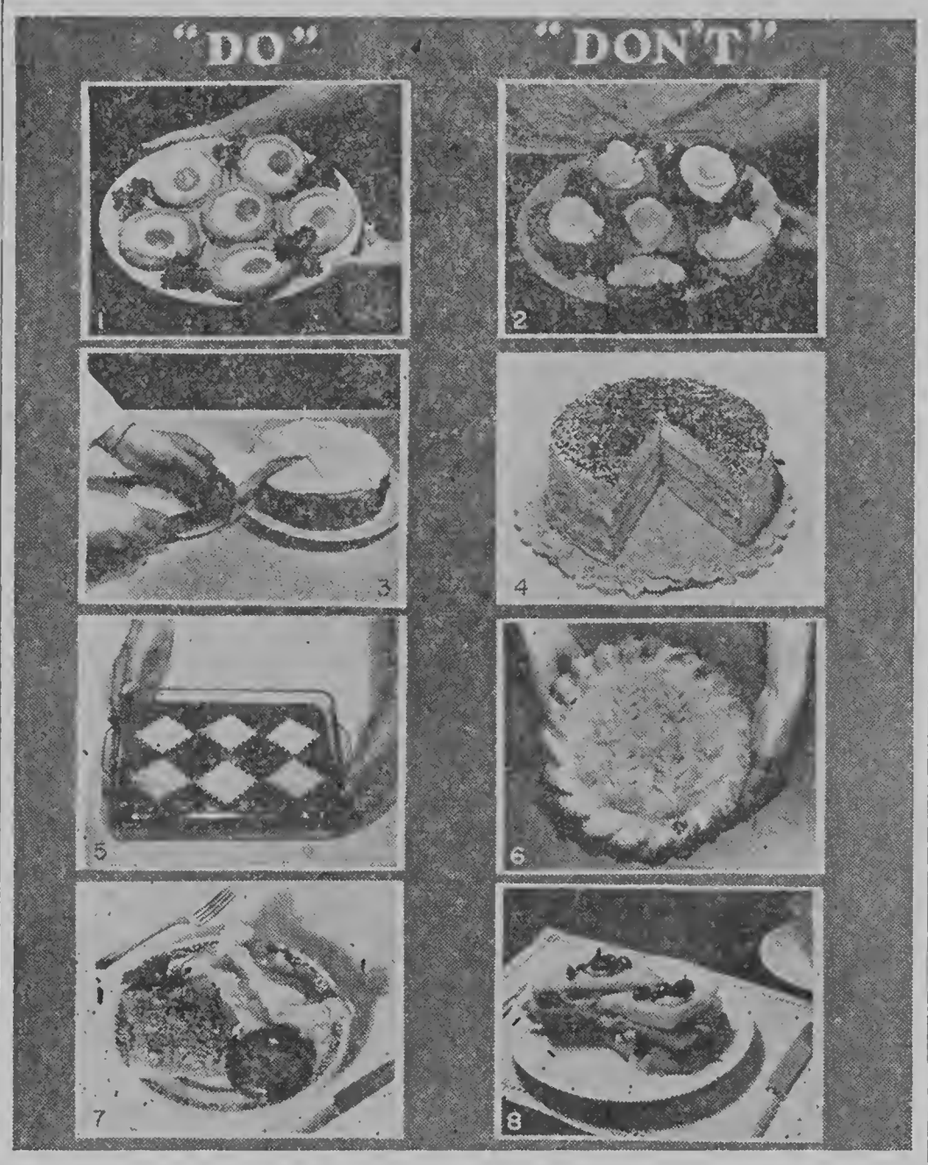
Use leftover cornbread in stuffings, or slice and toast it.

Use pearl barley when available to give body to soups and chowders, instead of rice, spaghetti or vermicelli.

Don't overlook buckwheat cakes as cereal food for breakfast.

Use perishable foods when they are abundant. Save the others for shipment abroad. On the abundant food list at present are: poultry, eggs, fresh and frozen fish, potatoes, many fresh fruits and vegetables.

Crops from home gardens free more market crops to feed the starving.



President Truman's Famine Emergency Committee is seeking to conserve wheat and fats and oils so as to supply more to famine stricken peoples over the seas. FEC has asked Americans to cut down their use of wheat and wheat products (bread, cake, crackers, and the like) by 40 percent; fats and oils by 20 percent.

These "do's and don't's" are suggested ways of helping to get those reductions.

(1 vs 2)—Bake eggs in mashed potato cups instead of serving poached eggs on toast. Potatoes are in good supply. One small serving of potato, as in the potato cup, offers approximately the food value of one slice of bread.

(3 vs 4)—Skip the three layer cake, lavish with flour, sugar and fat, for the duration of the famine emergency. For a party cake once in a long while serve a cake of two thin layers with fruit filling and meringue topping, or a plain loaf cake or cup cakes. Best for conservation are desserts of fruit, egg or milk rather than cake or pastry.

(5 vs 6)—Instead of the customary two crust pie, serve deep dish pie with pastry cut cuts, or a one crust pie to save flour and fat—precious foods today.

(7 vs 8)—Open face sandwiches made with one thin slice of bread help save bread, and thus free wheat for export. Skip the triple layer clubs that use three times as much flour, also the usual two slice sandwiches, when possible.

Save and Waste Not

Washington, D. C.—This is a daily, constant reminder that the lives of millions of people in famine-struck lands depend upon the help that Americans can give in these four ways:

1. **Eat less wheat products and fats** such as bread, cereals, macaroni, pies, cookies, cakes, salad dressing, etc.

2. **Waste nothing.** Dress up leftovers. Buy no more than you can use. Clean your plate. Re-use them salvage kitchen fats.

3. **Serve more plentiful foods** such as potatoes, eggs, poultry, fish, fruits and vegetables in season.

4. **Keep up your victory garden** and preserve food at home.

It may be used in newspapers as an ad drop-in, as a cut in connection with stories on food conservation and other famine-relief activities, and in other ways that will stimulate public consciousness of the famine campaign and the urgency of active, personal participation by every citizen. You may find more uses for it on letters, in promotional material, and in other types of printed matter. Its consistent use in many different ways will identify stories, appeals, suggestions, and advertisements specifically directed toward food conservation and famine relief generally.

Useful Articles Made From Sacks

Farm women in Bullock County are making many useful articles from feed and fertilizer sacks. Mrs. Milton Cobbs of Great Hope Community, gave a method demonstration on bleaching sacks. She showed the club women that the articles made from sacks could be pretty as well as useful.

Club women from all over the country have made pillow cases, sheets, scarfs, towels, spreads, table cloths, short coats, shirts, curtains, and shopping bags from sacks

The shortage and high price of textile goods creates a need for more farm women to solve their clothing and household linen problems the same as Mrs. Cobbs has done.

—Negro Farmer

4-H'ers Make School Garments

4-H club girls of Morning Star Community, Perry County, completed 11 skirts of cotton material at their March meeting. None of the skirts cost more than a dollar.

Now that they have made skirts, they are working on blouses. By the end of the year, they will have made a number of garments for school.

These club girls are improving their school wardrobes and saving money while they are learning to make clothing.

Neil Scott Associates Sewing Contest Endorsed by United Negro College Fund, Inc.

New York, N. Y., April 23—The creative efforts of Neil Scott and Associates received distinguished acknowledgement today when their National Sewing Contest was formally endorsed in a weekly news letter to the presidents of the thirty-three participating colleges in the United Negro College Fund Drive.

The News letter said: "A National Sewing Contest now being conducted among the students of Negro Colleges by Neil Scott Associates, in behalf of a major thread account, has changed its prizes from a seat at the forthcoming Louis-Conn prize fight to scholarships valued at $100.00 each."

"Under these circumstances, we consider that the competition in your particular institution should be given whatsoever stimulation possible. Because of the splendid opportunity the competition offers for uncovering special talents among young women students, it would be worthwhile if some sort of exhibit could be arranged at which the individual efforts of the contestants can be shown." This statement was signed by Ernest Johnson, Publicity Director.

The Neil Scott Organization sponsored the National Sewing Contest in the hope of interesting Negro women in home sewing, by which they could save more than $1,000,000,000.00 per year. More than 5,000 women have entered the contest and are competing for the $100.00 prizes. All of the contestants are being asked to submit their work to the Neil Scott Organization by June 1, 1946. A board of Internationally famous judges are being selected to judge as to who should be the winner. The judges' decision will be final.

Sumter Woman Sews and Farms

Miss Beulah Rumbly, Sum- County, is a success in sewng as well as farming.

This Intercourse Community leader sews at home for a local store in York. She makes evening dresses, pajamas, shorts, slips, and street dresses for sale. Money received from sewing was used to remodel her kitchen and to buy furniture for her living room. She is now planning to remodel her front porch.

Upon the death of her father, Miss Rumbly took over the management of the 80, acre farm. She cultivated 40 acres and the remaining acres are in pasture and woodland. Her main crops are cotton, corn, and potatoes. She also sells timber. The year-round garden, three milk cows, chickens, and turkeys supply her three sisters, mother and her with plenty of wholesome food.

Her pantry shelves are filled with 300 quarts of fruit, vegetables, and meats which she produced at home. She raises all of the feed for her livestock, with the exception of hay. Each fall she plants Austrian winter peas to build the soil.

In normal times, 22.2 per cent of all airport income in the United States comes from the sale of aviation gasoline.

THE MODERN FARMER

VOL. XIX. NASHVILLE, TENN., JUNE 15, 1946 No. 5

The Road Up

Farm Ownership Veterans' Opportunity

By

GILES A. HUBERT

One million veterans of World War II have indicated their desire and are making efforts to get resettled in agriculture. Most of them want to own farms. Most of them have an agricultural background and know what farming is.

How many of these are Negroes, we don't know, and early estimate said 27,000. It is my opinion that many more than this are or would be interested provided they could foresee the possibility of owning a good farm and living in a comfortable farm home.

During the past year the Farm Security Administration made it possible for nearly 2,000 veterans to begin purchasing farms. It looks forward to being able to make direct loans for farm purchase to as many as 20,000 veterans within the five year period following V-J Day. In addition to this the "Cooley Bill" which gives permanent states to FSA gave the new organization authority to insure farm purchase loans made by other agencies, i. g. banks and mortgage loan companies, up to $100,000,000 per year.

I doubt that many Negro veterans know about this or know how to go about securing farm purchase loans or whether or not they can qualify for such loans. Every veteran interested should go to see the **nearest Farm Security Administration Supervisor** or to the nearest State or Regional office of the FSA.

After the veteran qualifies, **he still must find a good farm**—that is good enough to be approved by the local FSA committee for a loan.

This, it appears to me, could very well be a community responsibility and a community undertaking. Each good farming community could organize a veteran's advisory committee or rather a committee on **Farm for Veterans.** This committee would take for its responsibility to locate farms that are available or that might be available.

They would wait on the local county FSA supervisor and the local FSA committees (who are usually all white) and let them know that the community is interested in the problem of Negro veterans securing farms. They would tell these agents that they were ready and willing to help veterans secure good farms in their area or county.

These committees should contact veterans who went to the war whether they have come back home or not; contact them through their families or friends. They would write them letters informing them of the availability of an opportunity to purchase a good farm and to secure FSA aid.

The problem is to get the interested veteran, the agency and the farm together. Community action of this type would be the best way to get action out of local officers

16,000 Veterans Receive F. S. A. Loans

367,000 Veterans Return To Farms In The South

Washington, D. C.—Of the 650,000 white and colored veterans of World War II who had returned to the farm by last March, 367,000 returned to farms in the South, the U. S. Department of Agriculture reports.

Among those who returned to farms in the South, 276,000 are either operating their own farms or are working on farms with their parents. About 91,000 are employed as hired workers.

During the war 671,000 white and colored farmers and farm laborers were inducted and enlisted in the armed services. The number of veterans now on farms represents 55 per cent of the total number of farmers and farm laborers who entered the armed services.

While some veterans are returning to farms and farm jobs which were theirs before the war, others are being placed through Extension Service Farm Labor program. A recent report shows that between January 1945 and April of this year, Extension Service helped 50,797 white and colored veterans get started in agriculture as hired hands, sharecroppers, and tenants.

17,000 WEST INDIES WORKERS ON FARMS HERE

Approximately 17,000 West Indies agricultural workers are now employed on farms in this country.

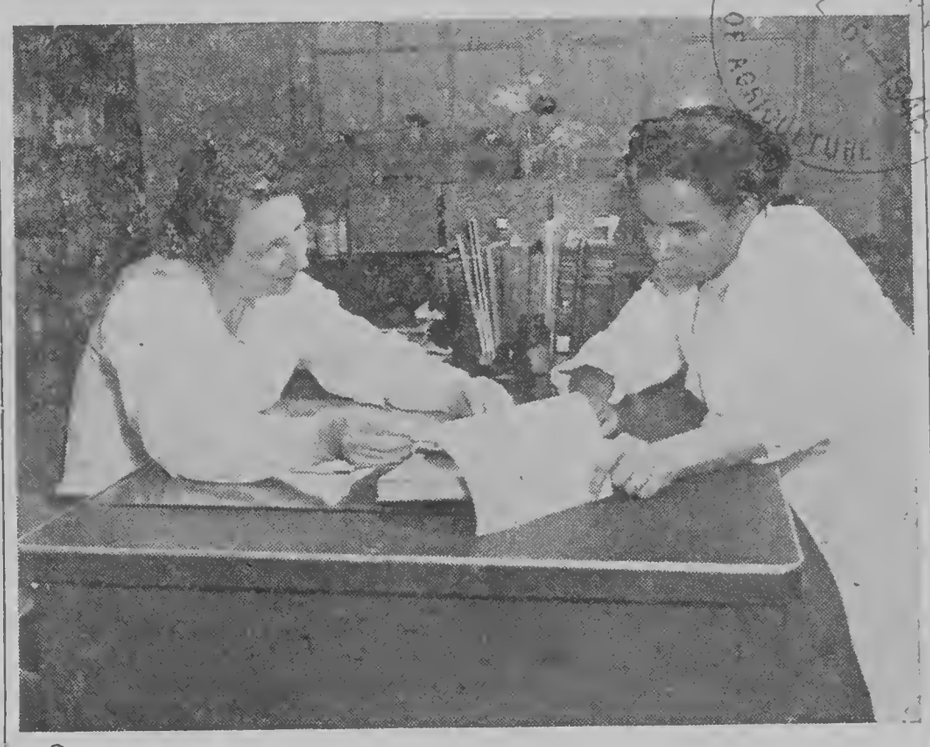
(Continued On Page 2 Col. 1)

PMA Committees Must Approve Farm Building

Under the veterans' housing program, any farm dwelling costing $400 or more, or any other farm building costing $1,000 or more, must be approved by the county and state PMA committees before the materials can be obtained, states W. B. Crawley, chairman of the state committee.

An application, containing all necessary data in regard to the materials needed, the total cost, and the necessity for the building, must be filed with the county PMA committee. The state committee has the final approval of all farm constructions up to $10,000 for a single family dwelling; $17,000 for a double family dwelling; and $50,000 for barns or other farm construction.

Assists In Nutrition Research



MISS KATRINE WHITE, right, scientific aide in the Beltsville laboratories of the Bureau of Human Nutrition and Home Economics of the U. S. Department of Agriculture, is shown conferring with Mrs. Helen W. Warren, food chemist, on future assignments. Miss White, who is a graduate of Livingston college where she studied chemistry, assists Mrs. Warren in carrying out studies in vitamin research.

Soil Conservation Can Bring New Prosperity To Southland

Washington, D. C. — Better health, better education, and better opportunities will come to the white and colored farmers of the South with the application of improved soil conservation practices, says former Governor Sam Jones of Louisiana in an article appearing in the May issue of the U. S. Department of Agriculture publication "SOIL CONSERVATION."

"Despite our obvious dependence on the land for our very existence," says the former Louisiana governor, "this Nation as a whole is seeing its soil material washed and blown away through erosion at the rate of three billion dollars a year. At least 500 million dollars in soil is being washed from the States of the South into the Gulf of Mexico each year.

Pointing to the low standard of living on the farm as a result of improper care of the soil, former Governor Jones says that before the war, Louisiana farmers aver-

Colored USDA Technician Aids In Important Food Research

Washington, D. C.—The keeping quality of home-canned foods and their retention of food nutrients are important research problems which Miss Katherine White, colored scientific aide, is helping food chemists of the U. S. Department of Agriculture to solve in order to provide improved food conservation methods for American homemakers.

Miss White, who is a graduate of Livingston college where she studied chemistry, has been employed in the Beltsville Research Laboratories of the Bureau of Human Nutrition and Home Economics for nearly two years. Her duties include incubating samples, preparing testing solutions, and assisting the chemist in charge in carrying out tests for purifying and concentrating vitamin B-1.

The 23-year-old scientific aide,

Ex-Servicemen Get Aid From Farm Security Administration

Washington, D. C.—A new high in Farm Security Administration loans to white and colored veterans was reached when 5,400 ex-servicemen were financed in the purchase of farm operating equipment or family farms within a two months period, the U. S. Department of Agriculture said last week.

The loans, made during March and April, constitute nearly a third of the total number the agency has approved for veterans during the past two years, according to FSA Administrator Dillard B. Lasseter.

"We expect this record lending to continue," Lasseter said. "More than 20,000 veteran applications, most of them of recent date, are now on hand in our country offices and are getting preferential attention. Thousands of applications come in each month, and there is no indication that the peak has been reached."

More than 16,000 white and colored veterans have already received FSA assistance. A thousand of them obtained farm purchase loans under the terms of the Bankhead-Jones Farm Tenant Act from an earmarked fund set up by Congress for this purpose. The rest have loans to buy farm machinery, livestock, and other operating needs. In all, veterans have received $33,424,000 in loans from the agency.

Various handicaps had to be overcome before any great number of loans could be made. "In many areas, real estate prices have risen far above their pre-war levels, and veterans wanting to buy farms have a hard time finding any for sale at a price that the productivity of the land will justify. Moreover, veterans in some parts of the coun-

Colored Farmers' Curb Market Was Feature In Broadcast

Washington, D. C.—In recognition of the tenth anniversary of the first Alabama curb market operated by colored farmers, WAPI, a Birmingham, Alabama, radio station, featured the market in a broadcast on June 8, 12:45-1:00 p. m., according to a report the U. S. Department of Agriculture has received from Alabama Extension Service.

The broadcast presented a brief history of the market which is situated in Tuscaloosa, Ala., pointing out how colored County Agent Charles E. Trout, now in Liberia, West Africa, on a special agricultural mission, launched the curb market to provide an outlet for the surplus fruits and vegetables produced by the colored farmers in his county.

The market opened on May 23, 1936, with four sellers exhibiting their wares on kitchen tables and packing boxes in a vacant corner lot. Sales for the first day totaled only $11. This year the market is averaging $100 per day. Then as now, the market is operated two days a week—Wednesdays and Saturdays.

The kitchen tables and the packing boxes in the vacant lot have been replaced by a well built shed which houses the stands of 34 farmers. These farmers have organized a Curb Market Association with an advisory board and a clerk. Last year the sales of the association totaled $10,000.

During the broadcast, Mrs. Belle Bryant, one of the members of the association was interviewed. She has been selling vegetables, fruits, flowers, buttermilk, eggs, poultry, and smoked meats at the market for nearly eight years. Her sales average $750 per year. She has used the extra money from the mar-

(Continued On Page 2 Col. 2)

367,000 Veterans

(Continued From Page 1)

the Labor Branch of the U. S. Department of Agriculture reports.

An island-by-island breakdown shows that some 10,000 of these workers are Jamaicans, about 4,000 are Bahamians, and 3,000 are Barbadians. These workers are employed mainly in Florida, New Jersey, New York, Connecticut, Illinois and Ohio.

SUGARCANE WAGE HEARING NOW SET FOR JUNE 13

A sugarcane wage hearing will be held at Clewiston, Florida, on June 13 for the purpose of receiving evidence on fair wages for the cultivating and harvest of the 1946 Florida cane crop, the U. S. Department of Agriculture has announced.

The hearing was formerly set for May 18, but was postponed until the June date in order to permit witnesses to testify who would have been unable to have appeared at the earlier date.

The hearing is being held in accord with the Sugar Act of 1937 which provides, among other things, that in qualifying for conditional payments, sugarcane producers must pay wages at rates not less than those determined to be fair and reasonable by the Secretary of Agriculture after public hearing and investigation.

Colored workers, including West Indians, make up a large part of the sugarcane workers in Florida.

U. S. MISSION TO AID PHILIPPINE AGRICULTURE

An agricultural mission will be sent to the Philippine Islands before July 1 by the U. S. Government, through its Departments of State and Agriculture, on invitation of Philippine authorities.

The mission, which plans to spend about five months in the Island, will collaborate with Philippine agricultural scientists, educators and administrators. Its task will be to advise with the Philippine authorities on a national agricultural program.

WHAT YOUR SLICE OF BREAD MEANS

The extra slices of bread which millions of white and colored Americans are setting aside for the starving peoples abroad will go a long way toward saving human life, the U. S. Department of Agriculture says.

Officials of the Department point out that the residents of a single State could make an important contribution to the relief of the starving by cutting down on bread consumption. Take New York State, for example, if each of the 571,000 colored residents alone gave up one slice of bread at each meal for a month, the total would be over 51 million slices, or two and a half million loaves. And since there are 72 loaves in one bushel of wheat at 80 percent extraction, the slices of bread saved by colored New Yorkers would be equivalent to 35,000 bushels of wheat. Add to that the contribution of the 13 million white New Yorkers and there would be enough wheat saved to keep over 300,000 starving children in India and Europe alive.

SCHOOL CHILDREN HELP FIGHT FAMINE

Chester C. Davis, chairman of the Famine Emergency Committee has sent a letter to school officials thanking them for their cooperation in helping to get the famine message over to the American people. He says that the school children of the nation have carried the famine message into 22 million homes.

Asking the continued cooperation of the schools, Davis says that youngsters can further help fight famine abroad by eating only one slice of bread per meal, cutting down on rich pastries, eating more potatoes and fresh vegetables, leaving no food on their plates to be wasted, saving used fats, and by keeping their Victory gardens producing.

GARDEN SURVEY

A nationwide survey of home gardening and food preservation made by the Bureau of Agricultural Economics of the U. S. Department of Agriculture indicates that 49 percent of the American families had gardens in 1945. This totaled nearly 18½ million gardens. This year the Government is asking for 20 million gardens to help relieve starvation abroad.

The vegetables most widely grown in home gardens last year were: tomatoes, string beans, onions, lettuce, radishes, beets, cabbage, and peas. Although, gardeners reported having grown 35 different vegetables.

As for food preservation, the survey shows that more than 25½ million families did some preserving. About nine-tenths of the farm families and about two-thirds of the non farm families did some canning.

BUYS LIVESTOCK FOR UNRRA

Since January, the U. S. Department of Agriculture has been buying livestock through regular trade channels for shipment abroad by the United Nations Relief and Rehabilitation Administration.

Although, the Department purchased 20,000 dairy heifers, 650 bulls, and 36,700 horses. UNRRA has asked the Department to buy 60,000 additional horses for it.

4 H'ERS RAISE FUNDS FOR STATE CAMP

Colored 4 H boys and girls of Greene County, Georgia, have raised $521 to go toward the establishment of a State 4 H Camp, according to a report received by the U. S. Department of Agriculture from Georgia State Extension Service.

The funds were raised through a "Miss Green County" contest. The county has become well known in agricultural and social science circles through Arthur Raper's books, "Preface to Peasantry," and "Tenants of the Almighty." Both books deal with rural life in the county.

Colored Farmers' Curb

(Continued from page 3)

ket to help send her children to college, remodel her home, buy furniture, and operate her cotton crop on a cash basis.

Department officials point out that the curb market idea is spreading. Colored farmers in North Carolina, Florida, Arkansas, Mississippi, Louisiana, and Texas have established such markets through which they are protecting themselves against the hazards of one-crop farming.

In Liberia where former County Agent Trout is establishing an extension program to help the farmers in that country improve their production methods, curb markets, similar to the one in Alabama, are springing up. Trout reports that the President of the country buys his fresh vegetables from the curb market in Monrovia.

Soil Conservation

(Continued from page 1)

aged only $186 a year in cash income. Continuing, he said, "Louisiana was no exception . . . the average income of the South's people as a whole was $25.50 per capita per month, the cash income of our owner farmer was $15.50 a monh, and of our tenant farmers, $6.25 a month."

The farmer governor also states that before the war, 30 percent of the Louisiana farms had no milk cows, 27 percent had no hogs, 16 percent, no gardens, and 11 percent, no chickens. And he says that the State was importing 50 million dollars worth of livestock and seven million dollars worth of poultry that could have been produced by Louisiana farmers.

However, he says that the situation is changing. "Already we have the most complete soil conservation set-up in the Nation." We are wiping out our deficiencies in livestock, says the former governor. "In 1941 we had no agricultural lime plants and we placed only 10,000 tons of lime on all Louisiana farms. In 1944 we had three lime plants in operation and placed 300,000 tons of lime on our farms and pastures. We need three million acres of improved pastures."

Describing the soil conservation program underway in Louisiana, former Governor Jones says that while 87 percent of the State's agricultural area is embraced in soil conservation districts, only 9,300 of the State's 150,000 farmers have signed aggrements to install coordinated soil conservation programs.

Department officials point out that 17 colored soil conservationists and seven Field Service contact representatives are playing an impartant part in the over all program of the South by helping to encourage colored farmers to adopt sound soil and water conservation measures. Of the 370,—166,120 acres in farms of the South in 1940, colored farmers operated 30,192,000 acres, of which they owned more than a third. Louisiana colored farmers owned over half a million acres.

Former Governor Jones says that if the white and colored farmers of his State will continue to conserve their soil and diversify their farming program, the rural people will be healthier because of improved nutrition, their schools and churches will be better, and their opportunities in general will be improved.

Ex-Servicemen

(Continued from page 1)

try have found that few productive farms in their locality are available for rent," Lasseter said.

Veterans' persistence in locating farms and the aid of FSA committees are partly responsible for the recent increase in loans. "If they were less in earnest about becoming farmers, we would not have been able to help so many of them," he said. "But they have been making a diligent search for farms, and they are turning up good ones."

Operating assistance is given only to veterans with farm experience who are unable to obtain the credit they need from other sources. The loans may range up to $2,500 at five percent interest for one to five years. Farm purchase loans, which may go as high as $12,000, and are repayable at three percent interest in up to 40 years, may be made to any qualified veterans who can find a farm for sale at a price in line with its long-time earning capacity value, and who needs FSA's individual guidance in sound farming to be successful as an owner.

Colored USDA

(Continued from page 1)

who was graduated from the Salisbury, N. C., college in 1944, is one of the first colored women to be employed to do scientific work in the Bureau of Human Nutrition and Home Economics. Her appointment and that of these other aides is an outgrowth of a conference of teachers of home economics in Negro colleges which was held at the Department of Agriculture here in 1942.

Cotton Yield Good, Acreage Low In '45

Alabama's 1945 cotton acreage was the smallest since 1871, but the average yield of lint per acre was the second highest on record.

The 1,400,000 acres of cotton harvested last year yielded 931,000 bales worth $104,709,000 and 357,000 tons of seed valued at $18,100,000. The 319-pound average yield of lint per acre last year is surpassed only by the 1944 yield of 339.

J. T. Belue attributes much of the higher cotton yields to the fact that more farmers are following recommended practices of the one-variety cotton program, are using adapted varieties, better fertilizer, and improved cultivation and handling practices.

During the present world food crisis, full use of oatmeal as a wheat substitute is urged by nutrition specialists. Protein in a bowl of oatmeal with milk, or oatmeal in cookies, containing egg, or oatmeal blended into a meat loaf—all supplement the protein in milk, eggs and meat. Even a little protein from an animal source teamed with the oatmeal grain forms a highly nourishing combination.

Milk Gives Tallapoosa Farmers Income In Addition To Cotton

Sixty farmers of Tallapoosa County have learned that it is not wise to depend on cotton alone for their major income. They are supplementing their cotton income with milk.

These farmers are selling their milk to the Carnation Milk Plant, at Dadeville. From January through March they sold to the plant 153,100 pounds of whole milk with an average milk test of 4 per cent butter fat. They received $4133.70 and a subsidy of $1061.70 from PMA, an average of $96.59 per farmer for each of the three months.

Harry Kelly of Ozias Community, who is now milking four cows, sold 3,400 pounds of milk for $91.80 and received a milk subsidy of $23.80. After paying all expenses, Kelly cleared $69.50 for the three months.

Kelly says, "I am not going to stop growing cotton, nor will I depend solely on it for my income. I will always supplement my cotton with milk."

During the winter Kelly grazed his cattle on temporary pastures which consisted of frosted kudzu, oats, and grain sorghum. This year he has planted four more acres of kudzu and two acres of lespedeza sericea for hay and grazing.

Mrs. Arnold Crayton, leader of the Jackson's Gap Community Club, is setting an example for her neighborhood. Milk from her six cows supplements her cotton income. She sold the milk plant 3,947 pounds of milk over a period of three months. She received $106.56 and a milk subsidy of $27.62.

The farmers of Tallapoosa County are not buying commercial feed; they are growing their feed. They are improving their pastures and growing grazing crops. Every farmer knows that a good pasture brings greater returns in milk and money.

KEEP THE WHEELS TURNING

A shortage has devoloped of which the public has little knowledge, although it can have a far-reaching effect. That shortage is lead--the lead that goes into gasoline. Unless the oil industry can secure enough lead to maintain the octane rating of gasoline, the private and commercial motor transportation system will be seriously impaired. Old cars and poor gasoline could bring about a widespread breakdown.

Spokesman for the oil industry, in discussing the problem, "recognize that there is a severe shortage of metallic lead in this country and we agree that a curtailment in the use of tetraethyl lead is necessary. We likewise feel that the petroleum industry will cooperate to the fullest extent possible consistent with reasonable performance of truck, buses, and passenger cars in this country today." During the month of April, the government allocated 3,500 tons of metallic lead for use in the manufacture of tetraethyl lead. This is approximately two-thirds of the unrestricted consumption rate. In the opinion of petroleum authorities, it is essential that the metallic lead allocations for May and subsequent months be at least 4,000 tons if serious consequences are to be encountered in the petroleum and transportation industries.

There are things that this country cannot do without--one of them is good gasoline. A nation on wheels, without gasoline, is like a dairy farmer with a barn full of dry cows.

BEWARE

Everyone who has a dollar of savings in the banks, in securities, in life insurance, or for that matter in government bonds, has a direct interest in industry. These people, and they are counted in the tens of millions, either own industry or are beneficiaries of its operation. Crusades carried on against industries are realy crusades against millions of American citizens. Leaders in industry are trying to awaken the people to the fact that if savings are taxed or "socialized" out of existence by expanding government, the political independence of the individual will disappear.

The President of Socony-Vacuum Oil Company says, "The competitive enterprise system is not perfect and can still be improved; but is preeminent in that it has given more necessities, more of the good things of life and at the same time more freedom to the American people than any other system has given to any other people on the face of the earth." And the President of the Oklahoma Gas and Electric Company says, "I have a deep conviction that unless people in our industry speak plainly and fearlessly we are going to encourage any help from others, and without that we cannot long exist. I feel, too, that I am merely a steward for some 2,000 employes, 6,000 stockholders, 200,000 customers. My stewardship for stockholders includes 33 charitable and religious organizations, 21 educational institutions. 11 fraternal organizations, 9 hospitals, 11 investments trusts, 3,031 women, and some other groups which reach right down into the fundamentals of our American citizenship. I should be very remiss in carrying out my obligation if I fail to do less than tell the whole truth.

Only the stupid will write off warnings from such men as these against the brand of liberalism that constantly attacts the achievements and possessions of private citizens.

INCUBATORS, SHOES, AND DEAD MONKEYS

The Wright Brothers, at the time of their historic flight, would have been astounded if they could have looked ahead to the manner in which the airplane would soon be utilized by imaginative man. They would have been amused too at some of the cargoes carried. Recent shipments have included incubators, broken-in shoes and dead monkeys.

Not long ago the birth of triplets in a Kansas City hospital created a sudden emergency that would have ended tragically in "the good old days." However, an incubator was delivered by air express in a few hours. In another instance, a number of dead monkeys were air-expressed to the Museum of History in New York, all the way from Columbia, South America. Speedy transportation was necessary to prevent deterioration of the carcasses before they could be treated by taxidermists. The oddity of the shoes was occasioned by the vacationist who wanted his favorite pair of broken-in shoes delivered quickly to him in Mexico City--and they were, by air express, the morning after a telephone call to his wife.

These incidents may sound like a joke, but they are really part of the day's work of the Railway Express Agency--which like every other private enterprise depends for its existence upon rendering a service that the public wants, and rendering it efficiently when it wants it.

COSTLY LOAFING

The magazine Newsweek of April 8 published the following brief item:

In February, the Labor Department reported strikes lost the nation 21,500,000 man days of work. At $1 an hour, the level of average hourly wages the department found in its last survey, February strikes cost the workers $172,000,000. In February, 1929, strikes took only 156,000 man-days. At 56.6 cents an hours, the 1929 yearly average, they cost $706,368. In February, 1939, strikes took 553,000 man-days. At the 1939 yearly average of 63.3 cents an hour, they cost $2,800,392."

THE IMPORTANCE OF GARDENING TO THE FUTURE OF THE NATION

M. L. WILSON
Director of Extension, U. S. Department of Agriculture

There are many things to be said about the importance of home gardens in relation to the food situation and the humanitarian aspects of the saving of lives in the civilized world today. Secretary Anderson and some of the others on this morning's program have gone fully into that. But there is another aspect of gardening that is very important for the consideration of your conference this week.

On March 11, Congressman Clarence Cannon of Missouri gave an address on the floor of the House of Representatives in tribute to victory gardeners and their contributions to the food needs of the world. In that address, Congressman Cannon said:

"They want to continue it in the future, not only in growing vegetables, BUT IN WORKING IN THE BROAD PHASES OF GARDENING THAT WILL IMPROVE AND ENHANCE THE HOME GROUNDS AND TEND TOWARD A HAPPIER FAMILY LIFE."

That is a significant statement to be made in Congress. It summarizes in one brief sentence the fundamental aim and purpose of gardening in our national life. It comes appropriately from a man who is not only a great parliamentarian, but an authority on history and a practical horticulturist.

New Point of View on Human Development

There is a trend in higher education now which is becoming more and more pronounced in many of our colleges and universities. By way of illustration I might mention the University of Chicago. It has set up a committee to coordinate all of the sciences dealing with man—the biological sciences, the psychological sciences, and the social and cultural sciences—so that the student gets a concept of the nature of man, his development, and his needs.

Horticulture and Healthful Living

Considering this kind of academic education, which places great emphasis on human development, it seems that the field of horticultural science, and its application in practice, would have A TREMENDOUS CONTRIBUTION TO MAKE. Horticultural science and horticultural skill, like any other skill, deals with knowledge that has to be studied and understood. Its development, all the time, requires people's interest in horticulture and such interest in developing as we have seen in the victory garden program. Horticultural science, I would say, includes knowledge in the field of genetic science, plant insects and diseases, the newer knowledge about fertilizers, plant nutrition, and the like.

WE NEED GARDENING EDUCATION of this kind as the tremendous response to wartime victory gardening has shown. The growing of plants—not only vegetables and fruits—but trees, shrubs, and flowers—can be a real asset to the ADVANCEMENT OF MODERN LIVING, RURAL AND URBAN. Horticulture is one of the arts which it is necessary for more and more people to take part in if we are to follow the advanced concept of the individual person being most fully developed educationally to fit into modern, civilized society.

Trade, Press and Professional Participation Needed

If we are to have general understanding of the simpler phases of horticultural science, and broad application of the art of horticulture, then such continued emphasis on gardens as we had during the war, and as your conference plans to urge as a CONTINUING PROPOSITION, APPEARS ESSENTIAL. That means enthusiastic participation and leadership everywhere of the horticultural trade—seed and nurserymen, large and small; trade associations; professional horticulturists and horticultural societies; civic associations; town and city administrators; garden clubs; garden editors; garden writers and garden magazine publishers; 4-H Club and other Extension cooperating groups; leaders in educational circles, teachers in the schools as well as the colleges and universities; citizen's garden committees; industrial leaders sponsoring garden programs for workers; worker garden clubs; and the host of other victory garden enthusiasts represented here and having a genuine interest and responsibility in the CONTINUED PROMOTION OF MORE AND BETTER GARDENING AS A PART OF MODERN LIFE. I hope that all of you will get better acquainted with the services and cooperation along gardening lines which you can get from the Department of Agriculture and the cooperating agricultural colleges and State and County Extension services.

What Farm People Are Doing

In the way of a report, I can say that many of the State Extension services are rapidly incorporating garden programs such as landscape and farmstead beautification into their teaching. I should also say that they are finding many people with a high enthusiasm for these projects. Last year over 88 HUNDRED 4 H CLUB BOYS AND 90 THOUSAND GIRLS WERE ENROLLED IN HOME GROUND beautification work and a total of about 175 THOUSAND FARM MEN AND WOMEN were extension cooperators in home ground improvement. State agricultural colleges are aware of the IMPORTANCE OF THE BROADER ASPECTS OF GARDENING and in many States they are pushing it hard through the Cooperative Extension Service.

City Horticultural Agents Needed

Although the Smith-Lever Act states that the purpose of cooperative extension work is" . . . to aid in diffusing among the people of the United States useful and practical information on subjects relating to agriculture and home economics, and to encourage application of the same," many people still think of extension work being a service concerned only with the problems of farm people. In the words of the basic legislation this certainly is not the case, although in practice there are, of course, limitations in personnel. Certainly, here in the Department of Agriculture, and at many State land grant agriculture colleges, there is a growing feeling that there are many aspects of service in fields dealing with knowledge of growing things and the science of living that GO DISTINCTLY BEYOND PEOPLE LIVING ON FARMS. Services made available by county extension agents to many cities in many states, in connection with wartime victory gardening, are an outstanding example. In the continued garden program, there is a great opportunity for the Department of Agriculture and the land-grant colleges to PROVIDE A SERVICE TO URBAN AREAS. We need extension agents in the cities who do what the county agricultural agents do for farmers. Perhaps an assistant to the county agricultural agent, especially trained in horticulture to serve urban areas, could supply the service needed in many counties with large urban populations. However, as I have said, the initiative in the cities, as has been the case all along in the country, MUST COME FROM THOSE COOPERATING GROUP WHO SEE THE NEED FOR SUCH SERVICE and who want it badly enough to do something about it.

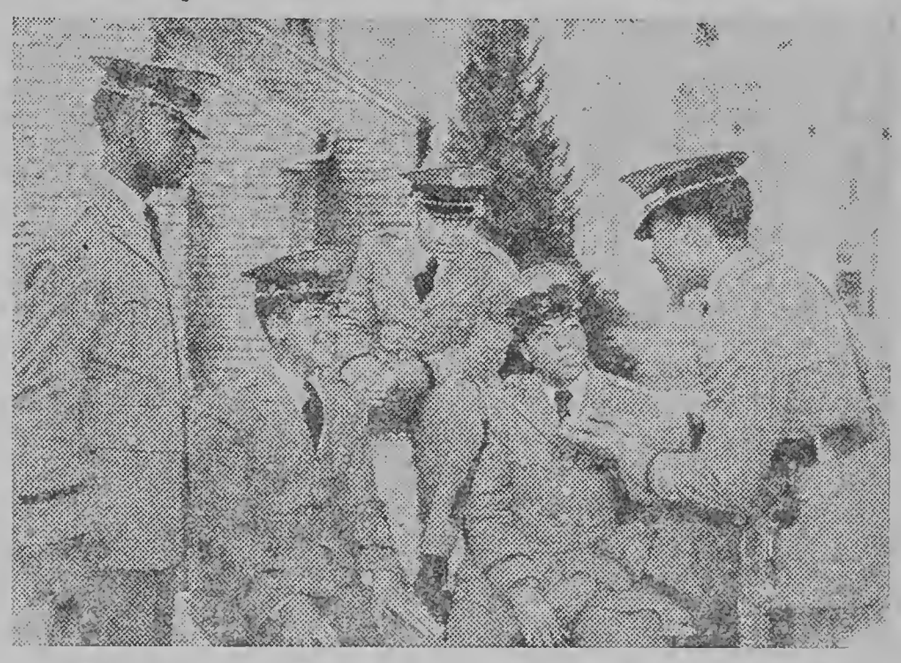
Education Must Keep Pace With Science

Some years ago, before the rumblings of World War II, there were many leaders in this country who emphasized the need for a program of decentralization. Under this plan FACTORIES LOCATED IN RURAL AREAS could become the source of livelihood for industrial workers who could LIVE IN A NEARBY GARDEN CITY OUT IN THE OPEN. Unfortunately the war came so fast, and the expansion of wartime industry largely took place in the already overcrowded industrial areas that we actually greatly increased centralized industry. As we convert to peace, we are in an appropriate time to AGAIN CONSIDER DECENTRALIZATION PLANS FOR THE FUTURE. Many large industries have already ADOPTED THIS PLAN AS A policy. The National Garden Conference could certainly give further thought to it in the interest of a broader emphasis on gardening and A HEALTHIER AND MORE SATISFACTORY LIFE on the part of many workers and their families.

The close of World War II unfolded before our eyes another great development in the field of science—THE HARNESSING OF ATOMIC ENERGY. Should mankind be so foolish as to use this new development for scientific warfare, then, of course, a decentralized, de urbanized life would be essential for our very existence. I think, however, that most of us here have hopes that ways and means can be found whereby atomic energy will be used for an era of human betterment, a civilization such as ALL OUR FOREBEARS OF ALL THE AGES HAVE HOPED WOULD SOME DAY COME. It is in such a civilization that the broader aspects of gardening will find its rightful setting. With atomic energy HARNESSED TO SERVE MAN, the STANDARDS OF LIVING OF THE HUMAN FAMILY WILL RISE TO UNDREAMED OF HEIGHTS.

Such a civilization, however, will require the fullest expansion of educational effort. It will require enthusiasm for the worthwhile things in life, like that which was generated almost spontaneously by 20 million victory gardens during World War II. If the many groups represented here go home in full support of the recommendations your conference will adopt, we may have hopes that this program for BETTER GARDENS AND BETTER HOMES AND BETTER COMMUNITIES THROUGHOUT THE NATION will be one of the real factors that will contribute PHYSICAL HEALTH AND GREATER MORAL AND SPIRITUAL VALUE to everyday American life. And these after all are the VALUES ON WHICH CIVILIZATIONS ARE BUILT!

Perhaps It's the $64 Question



ROCK CASTLE, VIRGINIA. Each month the student school paper of the St. Emma Military Academy, "The Belmeadian," features a popular column known as "The Inquiring Reporter." Here we see the editor at work interviewing an interested group on the campus. Shown in the photograph, left to right, are Cadets George Cagle, age 16 (Dist. of Columbia); F. X. Littlejohn, age 15 (Florida); Raymond Carter, age 16 (Ohio); Isaac Leon Newkirk, age 17 (Georgia); and the reporter, 1st Lt. Harold Gregory, age 17 (Virginia). The school dormitory and the St. Edward Chapel are shown in the background.

The Food Situation—How Gardening Can Help

Clinton P. Anderson
Secretary of Agriculture

Starvation Stalks Abroad

Everyone in this assembly knows that we are facing the most serious international food crisis of modern times. At least until the next harvest we shall be pressed to the limit of our ability to keep enough food supplies moving into stricken areas of the world to do our part in preventing widespread starvation. These food supplies will not assure well-balanced diets to the hungry people looking to us for help. They will do little more than to supply the small margin between life and death, the margin between minimum health protection and slow starvation.

At present we are ear-marking about 16 percent of the food supply available in this country for export—including relief needs. At least until the next harvest we shall need to ship every bit of food we can spare. And **we can expect a continuation of the need for relief feeding in 1947.** It will take another growing and harvest season to build up our own reserves again. Poor growing weather and poor crops abroad would result in continued urgent need abroad, just as bad weather here would cause food shortages in this country. We must prepare for all our needs and we must plan on producing considerable quantities above those needs, to **provide a margin for safety.**

During the war years you succeeded well. While husbands, fathers, and sons were fighting the enemy thousands of miles from home, almost half the families in America were tending Victory Gardens—growing Food for Freedom. Those 18 and a half million gardens were one of the big reasons why we were able to eat more and eat better during the war in spite of huge shipments to our armed forces and to our allies. During the war, **as much as 40 percent of our fresh vegetable supply came from Victory Gardens.** That was an amazing achievement.

Victory Gardens Will Release Food for Use Abroad

I think the President, the Famine Emergency Committee, and the Department of Agriculture have awakened everyone to the fact that, as far as the food situation is concerned, **the pressure is not off.** The pressure is greater now than ever. There are more people looking to us for food than ever before. There is **more need for Victory Gardens in this first year of peace than there was in any year of the war.** The war against famine is just reaching the stage of a decisive battle. If we lose this war we will jeopardize all that we gained on the battlefields.

In late February, President Truman called on home gardeners to continue their efforts in 1946, to produce and conserve food to help meet needs for foreign relief. Following the President's appeal, we called on all Governors, the mayors of our large cities, the Extension Directors, and many other leaders in national organizations, in industry, in radio, in the publishing business, and in many other fields to lend their efforts to a mighty garden campaign in 1946.

The response has been splendid. We have been assured of full cooperation by almost everyone we have called upon to help. We can interest many millions of families in having gardens this summer. Almost all those who have had successful gardens in the past are interested in continuing. In addition, millions of returned servicemen are good prospects for new recruits to the ranks.

Successive Planting and Home Food Preservation Are Important

Almost half the Victory Gardeners who were interviewed last fall said they did not plant a second crop after the first crop was harvested. That would seem to be one of the shortcomings of our past programs that we might undertake to remedy this year. Another thing our surveys demonstrate is that people with gardens are far more likely to can and preserve some of their family's needs than people without gardens. This year it is highly important that our people do a lot of canning and preserving.

A Continuing Garden Program for a Nation of Gardeners

This conference will, I believe, assure the success of this year's Victory Garden campaign. I hope it will lay the foundation for a continuing garden program that will give every family in America an opportunity to enjoy a richer life through the recreation, the security and the general community improvement that more attractive grounds and gardens provide. I hope that through your planning and the program you develop here, America will be on its way to becoming a nation of gardeners—a nation in which every plot of good ground adds something to the **beauty of our surrounding and the health of our people.**

Home Gardens Contribute Much To Better Diets and Better Health

I think virtually all nutritionists will agree that the average American family should eat more vegetables. It has been proven by numerous studies that people who raise their own almost invariably eat more vegetables than people who don't. People who raise gardens say they eat more vegetables than they did before they had a garden. I suppose one reason for that is that people—and this applies especially to children—are more likely to eat things they grow themselves, regardless of personal likes and dislikes. A child who does not like vegetables will probably eat those he helped to raise—and chances are he'll learn to enjoy them. There is no question that **gardens tend to improve eating habits** by increasing consumption of vegetables. This benefits commercial producers and canners directly—and it means a healthier, better balanced diet for our people. I believe, for example, that the rapid rise in the popularity of tomatoes and increased consumption of commercial vegetables during recent years may be credited to a large extent to their widespread promotion through home gardening.

A Healthier, Happier and Stronger Nation

The National Garden Conference is another milestone on the road to a healthier, happier, and stronger nation. To the extent that the garden program will make it possible to ship more food abroad, it will improve the chances for enduring peace. It will make the world a better living place for our children and the **generations to come.** I look forward with confidence to the success of your undertaking.

Vegetables Pay Bullock Farmer

Dave Rayborn, Mt. Zion Community, Bullock County, has already made $175 from his one-half acre garden plot this year. He sold turnip greens, English peas, cabbage, and onions. The plot also furnished enough fresh vegetables for table use and canning.

Rayborn fertilized the plot with 325 pounds of phosphate, 50 pounds of potash, 200 pounds of nitrate of soda, and 5 tons of barnyard manure. The land was flat broken and harrowed well before planting.

Rayborn has found that raising vegetables for market is one of the best means of supplementing cash income on the farm.

Fraternal Council Urges 6,000,000 Church Members To Conserve Food

Washington, D. C.—The Fraternal Council of Negro Churches in America, representing 11 major denominations and 6,000,000 members, has informed the U. S. Department of Agriculture that it is sending letters to local colored ministers throughout the nation, calling on them to urge their members to conserve food to help stave off starvation abroad.

Bishop A. P. Shaw, president of the council, says that, although many of our people right here at home are undernourished, few are in such straits that they cannot share at least a slice of bread with our starving neighbors in Europe, Africa, and Asia.

He points out that if each member of FCNCA churches gave up just two slices of bread a day, the weekly aggregate would be about five million loaves of bread. "This," he says, "would go a long way toward relieving the starving peoples abroad."

The letter which the Council is sending to its ministers suggests that churches buy seeds and distribute them among their membership as a means of encouraging all members who have adequate plots to plant gardens so that a larger part of the commercially grown foods may be shared with hungry peoples overseas.

The letter also suggests that members cut down almost half on wheat products and about a fifth on fats and oils. Such foods as potatoes, poultry, fresh fruits and vegetables when plentiful are urged as substitutes for foods needed so badly abroad. Among the slogans suggested by the Council are: "God gave; let us give," and "We gave bullets, now let's give bread."

The letter closes with a reminder that the children of Europe and Asia are in danger of starvation—"Inasmuch as ye did it unto one of these my brethren, even these least, ye did it unto me."

Nation's Largest Home Building Program

WILSON W. WYATT
Administrator, National Housing Agency

You who have read the report I made to the President on the Veteran's Emeregency Housing Program know that we have set as a goal we must meet the largest building program this nation has ever known. This must not merely be the goal of those who are working in federal housing agencies—I hope it will be the goal of all Americans who believe our returning VETERANS SHOULD HAVE HOMES in which to resume normal civilian life with their families.

Community Action and Team Work Necessary For Better Living

When we set this goal we COUNTED ON ALL AMERICANS AS MEMBERS OF OUR TEAM and according we set up COMMUNITY ACTION as one of our keystones. We are asking every community to set up an Emergency Housing Committee to survey its local needs and to lay plans to meet them as part of the OVERALL NATIONAL PROGRAM. I know you are all convinced of the seriousness of the emergency and are wiling to do your utmost to dissolve it. As a group devoted to improving your communities, to bringing about BETTER AND PLEASANTER LIVING FOR EVERYONE, you, I know, are interested in what kind of housing we propose that the nation provide for the veterans. Statistically I can tell you this—we propose the starting of 2,700,000 medium AND LOW COST HOMES BY THE END OF NEXT YEAR.

The Importance of "OUTDOOR LIVING ROOMS"

We all know that we must do more than just provide the veteran with a floor, four walls and a roof. THAT DOESN'T MAKE A HOME. He wants a design of house that appeals to him; he wants comfortable attractive furnishings inside it and he wants a PLEASANT YARD AROUND HIS HOME. Most every veteran will want a place where he and his wife can GROW FLOWERS AND SHRUBS and many will want enough ground to grow vegetables as well.

You know as well as I do the importance of elbow room around a man's home, of space to relax—TO BUILD AN "OUTDOOR LIVING ROOM." You know as well as I do the BENEFITS WHICH ACCRUE TO A COMMUNITY from such types of housing—how the cost of crime and disease that festers in city slum jungles is cut down by SUNSHINE AND FRESH AIR and the other things that make a better environment.

Community Benefits of Attractively Landscaped Grounds

All this leads me back to what I started earlier—that the community is one of THE KEYSTONES OF OUR PROGRAM. It is the community which can plan so that the veterans' homes can be built on attractive lots, so that group housing and slum clearance housing can be set up on ATTRACTIVELY LANDSCAPED GROUNDS.

The first task is to get the veterans some kind of shelter for themselves and their families. The next task is to get them attractive permanent homes.

But I want all of you here to know that I think as you do—that four bare walls and a plot of ground ARE NOT ENOUGH. I want to set our sights high—to achieve better homes and BETTER LIVING for AMERICANS THAN ANY NATION HAS EVER KNOWN BEFORE.

I am sure that all of you will help us to do the job—and to do the job right.

Bilbo Cries In Pain

The great Senator Bilbo cries out in pain: "Are you folks going to let these Negroes vote against me too?" Gosh! the race must be close down there in the Magnolia State.

Trouble is that Mister Bilbo hasn't been interested in many people voting at all. But look—what's been happening. During the war, Mississippi went all out in inviting industry to locate in the state. Thousands and thousands of "poor white" backwoods people went to towns and got their first decent money paying jobs.

These people found out that there was something else to eat beside corn pone, fat back and sorghum. They found that there was something else to wear besides overalls and that people didn't necessarily need to go bare footed all the year except in winter.

They also learned that people could vote and ought to vote and that there were some other issues besides **"White supremacy."** These white people for the first time learned that they were also citizens of a great country and of a world. These people are going to vote in this summer's election and they are not likely to vote for Bilbo. Why?

Because they are not interested primarily in better wages and working conditions, better housing and recreation facilities, better schools for their children, something else besides **"White Supremacy."** And then too, some of them—many more than one prospect—have become members of labor organizations, even CIO.

This is what's making it hot in Mississippi. This will help Ol Sol make July and August exceedingly torrid months for friend Bilbo.

Now comes the court decisions allowing Negroes to vote in white primaries. That is the last straw. Thousands of Negroes voting in Georgia and Florida. Thousands more say they are going to vote in Alabama, Mississippi, Arkansas and Louisiana. They have registered, they have paid their poll tax.

So Mr. Bilbo, in real and fearsome agony, cries out to **"white Supremacy."**—"You Anglo-Saxons look here—don't let these Negroes vote."

Trouble is they will vote along with thousands of whites who have never voted before. And, not any of these will vote for Mr. Bilbo. Let us hope that these will be numerous enough to put out the old "court house group."

Maybe they won't this time, but the river has been crossed—it wont be long now.

Farm Ownership

(Continued From Page 1)

who often are not very concerned or who are busy serving the other people first. Should local efforts fail, then a county-wide organization could send a committee to wait on the stat and regional offiicals. The thing is to get busy and DO something.

When many veterans, and especially. Negro veterans, say that they are not interested in returning to agriculture, what they mean is that they will not under any circumstances, return to farm tenancy and the frustrations of the usual overlordship and subjugation found on southern farms. **They didn't fight for that.**

They might be very much interested, and many of them are interested in securing a chance on a good and adequate farm unit, with a good comfortable home to live in and adequate capital to work with. He would be further interested if this farm were located in a good community where most of his neighbors would be of his kind and a good place for his children to grow up.

Rigid Culling For Flocks Is Advised

Close culling of poultry flocks is urged by P. O. Davis, API extension service director. Reasons are:

(1) Sharp culling is needed immediately to conserve grain for people.

(2) Increase in grain prices will increase cost of maintaining poultry flocks . . . so producers will find it more profitable now than ever to cull out unprofitable birds.

(3) Feed saved will leave that much more feed available for good layers and for raising the young flocks.

SAVE THE GOOD

Casualty records of a large life insurance company, covering the two World Wars, offers an interesting gauge of medical progress during the past quarter century. During World War 2, the company paid $5,668,344 in deaths claims on war casualties, representing 7 per cent if all death claims paid during the period. In World War 1, the war claim payments represented 11 per cent of all death claims paid. Death claims in World War 2 resulting from disease, were $890,267 or 10 per cent of total war claims. The corresponding figure in World War 1 was 58 per cent of the total. In World War 2, military statistics show one death from disease per 1,000 men per year, compared with 65 men per 1,000 in the Civil War.

Life insurance companies do not juggle figures. The medical progress indicated above is real. It explains why the medical profession, and large sections of the public are favorable to a go-easy policy when it comes to political reorganization of the American medical system. No other nation has shown such striking scientific advances in medicine. In fact, in those nations where the government has participated most actively in medical activities, standards have deteriorated dismayingly.

Legislation now pending in Congress, such as the Wagner-Murray Bill, would make government the dominant factor in medicine in the same manner that spelled lack of progress abroad. We have the best medicine system in the world and the question is how to expand it, rather than copy the European failures. Nationwide compulsion is not the way.

Farm Credit Administration

United States Department of Agriculture, Kansas City 8, Missouri

KANSAS CITY, Mo.—With the recent repayment of $5,169,173 to the revolving fund of the U. S. Treasury by the Federal Land Bank of Columbia, South Carolina, all but one of the 12 Federal land banks of the country have repaid their Government-owned capital and paid-in surplus, according to I. W. Duggan, Governor of the Farm Credit Administration.

In the organization of the Federal land bank system it was intended that the capital stock of the banks should be owned primarily by the national farm loan associations which are in turn completely owned by their members. However, in the early Thirties, when the Federal land banks were given the task of refinancing many farm loans and the interest and principal payments on thousands of loans were extended or deferred, the Government assisted the banks by subscriptions to capital and paid-in surplus.

In all, the Government subscribed $125 million to capital and paid in $189 million to the surplus of the banks. Agriculture recovered and the financial position of farmers improved, the land banks began a program of repayment. Of the $314 million total which the Government made available to the banks, all but $76 million has been returned, Governor Duggan reported.

Capital stocks of the 12 Federal land banks totaled $106,290,708 as of May 1, 1946, of which $64,803,743 was owned by the national farm loan associations. The Government-owned capital was $39,957,850, all of which is in the Federal Land Bank of St. Paul.

FOOD RETAINING OPPORTUNITIES

The food chain store of the country. through the National Association of Food Chains, have published a booklet entitled, "Food Retailing Opportunities." Its foreword begins simply: "Millions of veterans are now entering business and professions. We, as food retailers, believe many of these veterans are qualified to enter the retail food business either as proprietors or as employes of established organizations. We believe we owe it to these men to give them the benefits of our experience. the purpose of the booklet is to assist them in two ways: (1) To help them form sound conclusions as to whether they have the proper qualifications to run a modern retail food store, and (2) if they do decide to enter this field, to help them be successful merchants."

The booklet discusses capital requirements, location, leases, layouts, licenses, merchandise, etc. It also touches on the underlying philosophy of modern mass merchandising. "One of the great contributions," it says, "of the retail food industry during the past several decades has been to reduce the cost of handling food. This means that more of the average family's money is available to buy other things. Thus, the standard of lifing has been raised. The food store operator of the future, chain or independent, will continue to render great service in this field in which he deals with the first essential of life--and his rewards will be measured largely by the extent of his contributions."

"Food Retailing Opportunities" will be of value to every prospective food retailer. Also it states the case effectively for the highest standards of distribution generally.

Farm Owner

WILLIE DENSON, World War II veteran, and his wife, Elnora, and baby. He is the first Negro World War II veteran in the Southeast to purchase a farm of his own under the terms of the Bankhead-Jones Farm Tenant Act. Despite a crop failure in 1945 he was able to meet the payment on his loan, May, 1946. —FSA photo by Davis.

Improvements In Home Bring Owner Pleasure

Mrs. G. W. Daniel of Pittsview Community, Russell County, is proud of the improvement made in her home.

During the winter months she added more rooms by having the ends of a large hall-way closed. A partition was used near the back of the hall-way to make a large and a small room. The larger one is the living room and the small one a pantry for storing food. After completing these two rooms, the house was painted, All windows and doors were screened to make the house more sanitary.

Mrs. Daniel was able to make these improvements in her home with money received from the sale of vegetables. Some of this money will be used to buy furnishings for her home.

—Negro Farmer.

Fire Took 3,500 Lives Last Year

Fire caused a loss of 3,500 lives and $185,000,000 worth of property on farms and in rural communities last year, which is reason for greater effort in fire prevention this year, says Cecil Clapp, API extension forester. Fire losses are at the highest level since 1930, despite the fact that 85 to 90 per cent of farm fires are preventable.

May 5-12 Was Home Week In Alabama

With the slogan "Today's home builds tomorrow's world," Alabama's 50,000 home demonstration club members joined other rural women over the nation in observing National Home Demonstration Week, May 5-12.

"The week was set aside to call attention to the progress made in rural family and community life by the home demonstration program," says Elizabeth Forney, state home agent, API.

Around 80,000 Alabama homes were influenced by the home demonstration program last year.

Smith-Doxey Forms Are Now Available

J. T. Belue, API extension cotton specialist, urges that applications for Smith-Doxey cotton elassification be filed as soon as possible. The closing date for applying for this free service in Alabama is August 1.

Classifieation and market services are available to one-variety growers in a eotton improvement program. County agents have reeeived application forms and can furnish assistance to groups wanting to form one-variety organizations.

MR. WILLIE DENSON BECOMES FARM OWNER

Willie Denson, Route 1, Wetumpka, Alabama, first Negro World War II veteran in the Southeast to become a farm owner in the Farm Security program, was able to meet his payments at the end of 1945 despite a crop failure because of illness in his family.

Denson purchased a farm of 160 acres with 80 acres in cultivation during the fall of 1944. His wife was ill during most of the year and he was unable to give his crop the attention he had planned. This year, however, he says things will be different since his wife has regained her health and they have a baby who is also hale and hearty.

The ex-soldier plans to have a 3 acre garden this year to help out in the food for peace program. The diversified farm plan which he drew up with the aid of the FSA supervisor calls for 1-2 acre of sweet potatoes, 1-2 acre of cane, 10 acres of corn, 4 acres of other grain, 10 acres of eotton and 10 acres in pasture. In addition, Mrs. Denson will raise 100 baby chicks. They have two cows and one hog.

Under the terms of the Bankhead-Jones Farm Tenant Act, he will have 40 years to repay his loan at three percent interest.

Choctaw Farmer Is Part-Time Logger

Needham Horn of Pushmataha Community, Choctaw County, is a farmer and part-time logger.

Horn has a farm of 240 acres, with 100 acres in cultivation; the other is pasture and woodland. He cultivated 50 acres last year. The other 50 acres were cultivated by a tenant. His farm income from livestock and crops was $950. Horn has no idea of giving up his farm to log. But he has made a job for himself and neighbors during the winter and lay-by season. He buys timber and sells logs to a nearby sawmill. He has a complete logging outfit with all modern machines.

There is an interesting story of how Horn started his logging business. He says, "When tractors came into my community, I hired a man to break my land and get it ready for planting, cheaper than I could by using my mules. I had some timber on my farm to sell and knew that I could make more by eutting and hauling it myself. By doing this, I received twice the amount I would have gotten if I had sold to a timber buyer.

"I contracted with some of my neighbors for timber on their land. They were eager to sell to me because it gave them something to do during their spare time. Last year after paying my expenses, I cleared $1,900 from my logging business alone."

—Negro Farmer.

Older Youth Of Nansemond County

SUFFOLK, VIRGINIA

The Older Youth of Nansemond County are not being forgotten by any means in the Extension Program for 1946.

This group came together February 6, and set up objectives and formulated plans for carrying out these objectives. Two outstanding objectives were to improve the livestock in the county and carry some hybrid corn demonstrations.

As a result of the above objectives seven registered puie-bred Berkshire males and gilts have been brought into the county by these young men from the Va. Ida Farms Petersburg, Va., which is owned and operated under the supervision of J. E. Settle, Director of Animal Husbandry at Va. State College.

These hogs are offspring from some of the best breeds of hogs in Virginia, representing such breeds as Va. Ida Typesetter, Fairacre Typesetter, Va. Ida Grenadier Countess, Epoch Grenadier 88, Pencroft Leigh 5th and Va. Ida Trueworth Leigh.

These young men paid $300.00 for these animals which were farrowed August, September and October respectively. This project was partly financed through the American Bank and Trust Company, Suffolk, Va. Papers were delivered with all of these hogs.

Thirteen of these members are condueting Hybrid Corn demonstrations under the supervision of the Extension Service. Nine different hybrids are being used in these demonstrations namely Ky. 72-B, U. S. 357, Funk's G-135, Funk's G-515, Pioneer 314, 313, 300, 200, and Tenn. 10. These demonstrations involved 15 1-2 acres of land. These demonstrators used an average of 400 lbs. 3-12-6 fertilizers sidedressing with from 150 to 200 lbs. of soda.

There are sixteen active members in this club, they meet once monthly in the farm agent's office to discuss the farm problems and other current matters.

There are five GI's who are very active in the organization. Eight of these members are full time operators of their farms, and the others are partnership with their fathers. Two thirds of them were former 4-H club members, four of them are married and have families.

This group not only has plans for carrying out Agricultural activities, but plans for recreational activities as well. Some of the recreational activities already under consideration for the Summer are picnic at the Seaview Beach one day and a banquet during the Fall.

James Harris,
County Agent.

OIL FROM MUD

A few years from now atomic-age techniques may make possible the conversion of seabottom mud into petroleum. This startling statement came from the Ameriean Chemical Society. It just goes to show how foolish it is to make grave predictions about American oil resources. Much of the oil that is being used today could not have been drawn from the earth a generation ago when a petroleum famine was predicted in twenty-five years. But the seientists and the petroleum industry have always succeeded in pushing the prognosticators out on a limb and sawing it off with technology. Eventually the prophets of exhaustion may give up.

Scientists are developing the theory that crude oil is found by the radioaetive transformation of organic substances. They are duplicating in the laboratory the radioaetive process that may explain how nature, over a period of ten million years, accomplishes the conversion of protoplasm, proteins, fats, and other materials, into oil.

The moral seems to be to make the fullest use of the resources available to us today, and tomorrow will take care of itself--if we let the seientists and industry alone.

CO-OPERATION FOR GOOD

By J. R. Otis

One of the outstanding accomplishments of the year has been the work of the Montgomery County Negro farmers who have set about to provide a public facility that has long been needed. The job is about us, all we need to do is to recognize it and decide that we will do something about it. Exactly, this is what Dr. Booker T. Washington meant when he said, "Let down your bucket where you are."

These Negro farmers of Montgomery County have organized a cooperative association and purchased property fronting on Monroe and McDonough streets. The purpose is to provide rest-room facilities for thousands of farm people thronging Montgomery's streets from Montgomery and six near-by counties. This service is also available to Negro citizens of Montgomery and surrounding towns who find their way to the State's Capital to shop.

The property was purchased at a cost of $13,500. This group of citizens has already raised by volunteer contribution from themselves, $2,500 for the down payment and expenses incidental to purchase.

The project will be a Community Center that will provide the following services:

(1) Rest-room facilities; (2) a waiting room with equipment for mothers with babies; (3) Health Center; (4) office space for Negro County and Home Demonstration Agents; (5) a quick lunch and fountain service; and (6) an auditorium with facilities for educational movies.

The project will cost between 75 and 100,000 dollars and it is the plan to have it completely finaned by business firms and interested citizens of the city and eounty of Montgomery. The only contribution that is asked of the city and county governments, is the annual contribution for maintenance-janitor service, lights, water and heat. The city of Selma finds that an investment for maintenance of their colored community centers is a paying one. Likewise, the city of Montgomery should find it a wise investment.

The support of the city, the county, and business firms and lay eitizens, white and black, is humbly sought. These farmer citizens of Montgomery County have made an effort to help themselves. They want to make the capital city of Alabama a place of clean living and an example of fine race relations.

The organization has been greatly encouraged by the fine cooperation and moral support of the Montgomery Chamber of Commerce, the Alabama Farm Bureau, the city and county officials, and the city and county Health Departments, O. C. Crowe, president, and I. S. Davis, secretary-treasurer, are confident that the money will be raised and the project will become a reality.

U. S. Department Of Agriculture Notes

Broadcast by Secretary of Agriculture, Clinton P. Anderson, Sunday, May 12, 1946, at 3:00 p. m. e. s. t., over the Columbia Broadcasting System.

(For Release at 3 p. m., Sunday, May 12.)

The government has taken, within the past few days, a significant step in our national effort to obtain more wheat for the relief of famine which threatens the people of many other lands. Last Wednesday, the Office of Economic Stabilization, the Office of Price Administration, and the Department of Agriculture jointly announced higher ceiling prices on the principal grains. The ceiling price on corn will be raised 25 cents; wheat will go up 15 cents, with comparable increases for the other grains.

This step is important not only to farmers, but also to consumers. There is every indication that the world food shortage will continue at least until the 1947 harvest. There should be some temporary relief of the critical famine situation near the end of the summer when European grain harvest is completed, but only temporary. Most of the nations of Europe do not produce nearly as much grain as they consume in normal times, and the shortage of manpower, farm machinery, fertilizers. and tractor horse power resulting from the war dooms their production this year to be even smaller than in the pre-war years. In order to avert another famine, they must nave grain shipped to them during the coming fall, winter, and spring. There simply will not be enough grain produced in the U. S., and other countries that have grain to export, to permit feeding record numbers of livestock and still provide hungry people with the grain they need to maintain life. We must make a choice between feeding starving people and maintaining our livestock numbers at record levels. Our choice, obviously, must be in favor of people.

During the war, the most urgent needs from American farms were for livestock and their produets; meat, milk, eggs, and poultry. These needs called for increasing the number of livestock to record levels and then feeding heavily to get maximum production. We produced a great deal of grain during each of the war years, including 1945. But the heavy feeding of livestock caused us to use up reserves of grains that had been built up before the war. Within the last year, our reserves have disappeared. We must live and share out of the grain produced last year and what will be harvested in 1946.

The significant thing that we must realize is that, with the end of the war, the stopping of lend-lease, and the reduced size of our armed forces, the urgent demand has shifted from meat, dairy and poultry products to grain to feed hungry people. Millions of people in liberated countries are crying for our food grains. When it comes to feeding people, we must face the fact that several times as many people can be fed directly with grain as can be fed if the grain is converted into livestock. So what we need from the farms of America is more grain and less livestock and livestock products.

It is this change in need that prompted the decision to raise price ceilings on feed grains and protein supplements. The effect will be to encourage farmers and ranchers to reduce the number of animals they produce, to send them to market at lighter weights, and to encourage poultry raisers to cull the low producing birds from their flocks. The early result may be more poultry and more meat animals coming to market. But the long range effect during the next year, will be reducing our meat consumption below present levels.

We are now in the midst of the most critcial period of the famine in lands overseas. Everything must be done to make our limited supplies of grain go as far as possible in saving the lives of starving people.

In the meantime, during the present critical period, millers are extracting larger amounts of flour from each bushel of wheat; brewers and distillers are getting along without wheat. And farmers are feeding as economically as possible. These economies will do much but they cannot replace the savings that can be made by your family and mine as consumers. Each one of can help now and in the months to come: we can buy less bread and be sure that we use all we buy. Every piece of bread saved means a life spared for one more day. Your generosity and self saerifice are essential in this effort to save human lives.

Importance of Vegetables And Fruits In Meeting Nutrition Needs

Frank G. Boudreau, M. D.
Chairman, Food and Nutrition Board of the National Research Council

It is inspiring to realize that we who are conferring here today, have a share in the success of UNO. Other international conferences have been held and more will be convened in the future to deal with the numerous political and economic problems which face the world today. It is unlikely that any of these conferences will bring peace to the world while **millions of its people live in daily fear of starvation.** . . .

Abroad, homes and plants are destroyed, millions are scattered as refugees. **They need everything:** seeds, fertilizer, lumber, artificial limbs, food, transportation; there is almost no article in common use among men which they do not lack ...Everywhere is the pervading anxiety and gloom of hunger. I do not wish to exaggerate the situation yet when I think of it in terms of human beings, like you and me, I shiver with the scantily clothed hungry child coming from a fireless home or cave, and suffer with the men and women trying to build up anew their broken and shattered lives. No progress can be made on the **road to peace until these neighbors of ours have been fed and clothed and housed.** Peace cannot be built on political agreements alone. It must rest on a foundation of **satisfied human needs,** and on friendly relationships between peoples.

Food Meant Victory

Food was one of the decisive factors in the first World War. It was of **even greater importance** in the second World War. When food was needed during the war, in greater quantities than we had ever produced before, our farmers and gardeners rose to the occasion. We produced enough food for our Allies and we fed our armed forces and our people better than they had ever been fed before. Food meant victory to ourselves and our Allies, and we spared no pains to produce it in abundance. **Food also meant health** to our people.....Now we must **complete our victory** by restoring our friends overseas to health.....The urgent need in Europe to prevent acute and prolonged starvation can be met only through the cooperation of **virtually every family in this country.**

Now Food Is Needed to Gain Victory Over Famine and Disease

Epidemics have always found their most fertile soil among the starving and the malnourished. We have more powerful defenses against epidemic disease than ever before, but the **best defense is prevention.** Epidemic disease does not, as a rule, spread rapidly among the well fed. By **helping to feed** our neighbors we help to **protect our own families,** for with modern methods of transport epidemics respect no boundaries.

Vegetables and Fruits Rank High Among Protective Foods

My task is to speak of the importance of vegetables and fruits in meeting nutrition needs. These rank high among the protective foods...Our appreciation of their nutritional value is something relatively new...A great surprise in nutrition studies, says Dr. McCollum, was the discovery of the **remarkable dietary qualities** possessed by the leaves of plants where these are edible. The leaf of the plant is a complete food, rich in actively functioning cells. Those cells contain everything which is necessary for the metabolic processes; and they supply all the nutrients which an animal requires. This is not, however, an argument for vegetarianism, since man's needs are not necessarily identical with those of domestic animals....

Fruits are outstanding in two respects: for their **flavors** and for **their anti-scorbutic properties.** I need not remind you of the value of the love apple or tomato, which is a cheap source of ascorbic acid, popularily known as Vitamin C. Apples, pears, peaches, and apricots also contain this valuable nutrient but in smaller amounts...The berries resemble the fruits in nutritive properties and in richness of flavor. Raised in the home garden and brought fresh to the table, they are subjects both for the poet and for the serious minded nutritionist. All of the fruits and most of the vegetables when fresh or properly cooked contain a vitamin which does not figure in nutrition textbooks. It is vitamin Z, the zest vitamin, which causes the mouth to water and **makes eating one of life's pleasures.**

Vegetables and Fruits Overcome Most Common Deficiencies of Diets

Vegetables and fruits do not, as a rule, supply much energy, but energy value is easily obtained from other foods. Moreover, those who have a **tendency to obesity,** which is common in this country among men and women leading sedentary lives, need to get their **iron, calcium and other minerals and vitamins without taking in much energy.** This they can do from **vegetables and fruits.**

Increased consumption of vegetables and fruits would greatly improve the American diet and it would help to overcome its most common deficiencies. Vegetables and fruit taken as a group, states Dr. Sherman, may be ranked next after grain products and milk in importance as constituents of an **economical and well-balanced diet.** They tend to correct both the mineral and vitamin deficiencies of the grain products and in a sense they supplement the milk also in that many of the vegetables and fruits are **rich in iron or vitamin C or both.** Increasing use of vegetables and fruits seems to improve the food value of the diet **at every point at which the American dietary is likely to need improvement.**

Preservation of the Characteristics of Youth

What is likely to happen if we succeed in improving the American dietary by means of a greater consumption of vegetables and fruits? The relation between diet and health is a very close one. The **best fed peoples are** invariably the **most healthy.** According to McCollum and Simmonds the **liberal use of the protective foods** means "the preservation of the characteristics of youth." The larger the percentage of calories taken in the form of the protective foods, the smaller was the percentage of failure in the preservation of the characteristics of youth.

The protective foods, among which vegetables and fruit are high, **will do more for the women of America than all the beauty shops,** and unlike the beauty shops, men and boys are also admitted to their benefits.

According to Doctor Sherman, the available evidence as a whole seems to justify the conclusion that preservation of the characteristics of youth **and extension of the prime of life** are very significantly aided by the taking of **a liberal proportion** of the needed calories in the form of the protective foods.

Gardens Help Build Peaceful World and Improve Nutrition of Americans

This is the beginning of a great campaign to save food for our friends abroad while **improving the nutrition of the American people.** By raising and consuming **more vegetables and fruit we shall need less cereals** and other energy foods. Cereals are ideal for shipment abroad; they have been throughout the ages the great remedy for famine. So in addition to all the other advantages which home gardeners enjoy, they can have the satisfaction of knowing that they are helping to build the foundations of a more peaceful world..

Dividends From Victory Gardens

When winter comes again I can imagine a typical home gardener's family sitting around the fire, thinking with satisfaction of their part in the relief of famine abroad, and looking forward to appetizing meals throughout the cold months because of their store of canned and preserved vegetables and fruit. Father looks younger than he has for years, those sagging abdominal muscles have tightened up a bit, and he has lost some excess weight. That tired feeling has left mother and there are dimples in her cheeks and a smile on her face. Beneath the sunburn on the children's cheeks glows the rich red dye of health. These physical benefits are accompanied by the stimulation of interest in the new world of soils, plant growth, and insects. the family has come closer to nature than ever before, and as always nature has laid on them her healing touch.

Vegetables and Fruits Have Great Nutritive Value

This may sound like a fanciful account of the benefits of home gardens. But I can assure you that it is based on fact. Nothing was more surprising to the old student of nutrition than the discovery that vegetables and fruit have great nutritive value. This discovery has been amply confirmed in practice. **Clear eyes, good complexions, sound gums, good digestion and proper elimination** are some of the rewards of home gardener.

His best reward will be the knowledge that by saving food for shipment abroad he is an active partner in mans most ambitious undertaking, building a **solid foundation for world unity.**

THE DREAM IS ENDING

Every dream must **end. The A**merican dream of coming out of the worst war in history better off than at the start of the war, is being dispelled. It was an unhealthy dream in which public debt was called savings, wages were unrelated to prices, and profits were evil. The coal strike and a fuel famine in industry are helping to bring us down to earth. Condemnation of Mr. Lewis and his **United Mine** Workers, by high officials, sounds more like frustrated hysteria than the formidable warning of an outraged government.

The position of the government is untenable and everybody knows it. The striking miners are doing nothing that is not permissible in the dream world in which we have been diving. **They have simply ta**ken the dream at face value as it has been peddled to them by a partisan government for many years. They are out to get their share of the dream. Their action has now been termed a "national disaster," by the Administration, and yet the highest officials in government have maintained that wages can go up while prices are held down. world reasoning. One sided labor The **real disaster is this dream**world reasoning. One-sided labor laws, prejudicial wage and price tinkering, constant vilification of private enterprise, over-riding of property rights, **general derision of** the efforts of business men to keep solvant and maintain privateemployment, these were **all part of the** dream, inspired by **high-riding pub**lic servants and labor leaders who seemed to care what **happened so** long as they remained in the good grace of their followers.

Well the dream is ending. **It now** remains to be seen **whether the** American people can get the sleep out of their eyes **before the right** to private property and personal liberty is a thing of the past. The miners' demands, if acceded to, can control management and confiscate earnings. They would set a pattern for like action in every industry.

TOO SMALL TO MEASURE

The season of corporate annual reports has rolled around again, and they contain much significant information pertinent to current events. A report of a sizable food chain store system notes that "your company continues to be seriously handicapped by the continued existence of wartime regulations and the carry-over into peacetime of governmental management of the economy." How many of these reports, intended **primarily for** stockholders **contain similar ob**servations? Probably thousands.

Another page of this particular report presents a graphic illustration of what becomes of a sales dollar after it has been received from the consumer. Over 80 cents is paid out to farmers and other suppliers of goods, over 10 cents is paid in wages; profit for stockholders and surplus amounts to 77-100 of a penny is paid out as compensation to elected officers of the company. If all profit were eliminated, a dollar item could be reduced ¾ of one cent, or if all company officers served for nothing. a $12.50 purchase could be shaved to $12.49.

A similar relationship between sales, cost and profits obtains in all mass distributing organizations. The profit per dollar of sales is almost too small to measure. **Volume** on a reasonable price. Mass distributors can not increase prices unnecessarily and stay in business.

LEARNING THE HARD WAY

An entire community--hotel, store garage, homes--was destroyed by fire recently in the state of Washington. In ten minutes thousands of dollars worth of property and a town were wiped off the map. Thirty families were stranded. Fortunately, no lives were lost.

In this case the fire may have been unavoidable. It was thought that a chimney spark on a dry roof started the conflagration. However, the citizens of this town should not forget the lesson they have learned. When they build again, and that will be no easy job in these days of shortages and high costs. they will undoubtedly give serious thought to the elimination of fire hazards. It is a good bet that hereafter they will make certain that their fire fighting equipment is in good order. If they have any luck at all, the nation's number one property destroyer will find slim pickings in their region for a long time to come.

Thousands of other communities could profit by the experience of this little Washington town. It learned its lesson the hard way. Others can learn the easy way, profiting by experience. They should follow the advice of fire prevention experts with greater diligence. They can revise obsolete ordinances, check the adequacy of water supply, encourage individual awareness of the danger of fire. They can go far towards eliminating a half-billion-dollar fire loss each year.

Anyway. there is one community in Washington that should hereafter be a good citizen from the standpoint of practicing fire prevention.

NO TIME FOR NAME CALLING

Name calling is out of place in the present emergency. The disgraceful antics of some labor, business and government officials at a time when practically every institution of American life is in danger, is inexcusable. The exchange of epithets between the head of the National Association of Manufacturers and a United States Senator, is typical. Each condemned the motives of the other in regard to price control. The public gained nothing from the exchange and the press wasted tons of valuable news print.

There are sincere, intelligent, patriotic people on both sides of the price control controversy who are struggling with a staggering economic problem--the sudden appearance of a back-breaking public debt. That a large part of the debt was unavoidable due to war, is water over the dam, and so is the profligate spending of the government for the past decade, and its failure to collect taxes to meet ordinary expenses.

The problem now, other than attainment of a balanced Federal budget, is how to prevent our representative form of government, together with the economic and political liberties of the people, from being crushed in the struggle of various groups to escape the hardships of postwar turmoil. No matter what happens, the law of the land and the safeguards against oppression, born of the wisdom of the ages and written into the United States Constitution, must be preserved. They cannot be preserved if they are ignored in attempts to control inflation, strikes, or any other economic disturbance. Nor can they be preserved if the government bows to the unreasonable demands of any group.

AN ADMISSION OF FAILURE

The railroad unions have always been given credit for outstanding ability in settling their wage controversies without **destructive** action. They have not been classed with the more radical elements in labor controversies. **It came, there**fore, as a shock to see President Whitney of the Brotherhood of Railroad Trainmen, recommending immediate seizure of "make suitable adjustments of grievances with employes."

The brotherhoods of Railroad Trainmen and Locomotive Engineers rejected the report of the presidential fact-finding board which recommended wage increases of sixteen cents an hour. They are showing a woeful lack of intelligence by rejecting the recommendations of an indeupendent gov ernment agency, and in having no better suggestion than government ownership of the industry in which they work. Asking for government ownership is an admission of inability to solve problems as free and independent citizens. Under government ownership there would be no place for unions—when you work for the government you don't strike— that becomes revolution and the Army takes over. At the present time when a union strikes against a private company, sympathy is more apt to be with the workers than with the **employers** But when government owns an enterprise, a strike becomes an attack on all the people, for they are then the owners and employers.

If the brotherhoods figure that under government ownership they could strike with impunity and refuse to abide by awards that do not meet their demands, they favor anarchy. Certainly men as intelligent as the members of the railroad union cannot contemplate any such course.

Running to the government, like a cry-baby to her mother **when he** wants all the other **little boy's** candy, is not the American way of doing things.

4-H Boy Grows Corn To Buy Dairy Calf

Robert Lee Burton, a 4-H club boy of Ozias Community, Tallapoosa County, produced 25 bushels of corn on his one acre project, sold the corn for $43.75, and bought a dairy calf.

Robert had talked to his county agent about getting a calf but he had no money with which to buy it. The agent advised him to grow a corn project last year. Money received from the sale of the corn could be used to buy the calf.

The calf was bought. Robert said, "I am carrying a calf and corn project this year. I believe a clubster should grow into farming through 4-H club work."

LOCAL GOVERNMENT OUR SAFEGUARD AND OUR RESPONSIBILITY

We may well pounder the prophetic warning voiced by Thomas Jefferson long ago when he said: "When all government, domestic and foreign, in little or great things, shall be drawn to Washington as the center of all power, it will render powerless the checks provided of one government as vernal and oppressive as the government from which we separated."

THINGS ONE REMEMBERS

By R. M. Hofer

I just looked in Webster's dictionary to refresh my mind on the meaning of socialism. It defines it as "a political and economic theory of social reorganization, the essential feature of which is governmental control of economic activities."

From this definition one can draw his own conclusion as to what he thinks is socialistic in the United States.

Among The Pastors

Rev. V. A. Edwards, Director
Better Rural Living in the Postwar Period

Under this subject, Dr. Arthur Raper, the Social Science Analyst of the Bureau of Agricultural Economics, United States Department of Agriculture discussed the changes that are taking place in the "Old Cotton South" before the 55th annual Farmers' conference at Tuskegee Institute, Alabama, December, 1945.

"Because Georgia is an integral part of the section of the United States East of the Mississippi River known as the Old Cotton South, and because rural pastors and churches get their support from the people, I am taking this opportunity to point out a few things in Dr. Raper's very timely and significant statement.

"Cotton," says Dr. Raper, "has long been the South's main crop, and most of it has been put in the ground and cultivated by one-mule plows, thinned and grassed with long handled hoes, and picked by hand. Because of these hand methods of production, the farm families in the Nation live in the 14 Southern States from Virginia around to Texas and Oklahoma; these families cultivate about a third of the country's cropland, and receive about a fourth of the country's farm income.

It now appears that there will be a rapid increase in the mechanization will of cotton production within the next few years. This mechanization will solve some of the South's old economic and social problems, and create some new ones. Many changes will take place throughout the South but the greatest changes of all will probably occur in the Old Cotton South, east of the Mississippi River where farms are smallest and incomes lowest.

"About a third of the farm families in the 14 Southern States own small to medium-sized farms, and a few of them are plantation owners. Over three-fifths of families live on somebody else's land as renters or croppers or wage hands. But be we big or little farmers, owners or tenants, white or colored, most of us get most of our cash each year from Cotton."

"Hand methods of cotton production are out moded—I've seen whole big fields of good cotton grown without the use of a hoe, a mule, or a hand picker. The growers were pleased with the results, and expect to expand their all-mechanized operations."

As to comparison of costs of machine picking with hand picking: Two years ago (1943), as reported in Acco Press (an Anderson Clayton Publication of Houston, Texas) cotton was harvested in the Mississippi Delta by mechanical pickers mounted on tractors for $5.26 a bale as contrasted with $39.41 for hand picking (at around $2.50 per cwt. seed cotton.)"

It stands to reason that the greater mechanization of cotton production the fewer farm families will be needed in the best land areas. "In Georgia a group of Agricultural experts estimated that 2,500 mechanical pickers would be needed in the State by 1950. This would mean a reduction of about 100,000 adult workers or around 50,000 farm families. In other phases of agricultural production it is to be remembered that similar changes are taking place." An over-all estimate by the Bureau of Agricultural Economics indicates that with full employment opening up in non farm job opportunities and a concerted effort to help some families leave agriculture for other occupations, the number of people working on Southern farms would likely shrink from 4,400,000 persons in 1940 to around 2,800,000 in 1956.

Such a highly possible shift of population will be at least a two-fold concern to rural pastors. The first concern is the effect the shift of population on the community institutions, particularly the church. As the membership shrinks so also does the financial support. The second concern may be that of helping to prepare this huge mass to shift advantageously to all concerned.

While many instances the die is cast, the effect of the shift has already been felt, there are still other situations where progressive leadership can bring the machines and the people together in such a way as to improve the community. For example many small independent farmers can develop group activities. Small operators as Dr. Raper suggests can be served by their neighbor's machinery when custom work is done at equitable rates, or a group of small farmers can own and operate machinery jointly. Part-time off-farm work will be helpful in many areas in stabilizing the small independent farm families on the land. Organized efforts at increasing production and marketing of marketable products, such as swine, dairy and poultry products and vegetables. These are great days for spiritual leaders to be courageous, helpful and faithful to the people they are privileged to serve. Self confidence and confidence in fellow men is needed to inspire the pooling of our newly gained resources, for the enrichment of life in both rural and urban communities.

In this period of transition and adjustment there are ways in which the following agencies can help: the public schools and colleges, vocational agricultural and extension services, the Farm Security Administration, Farmers Organizations, and the churches. These are days which challenge the leadership of rural communities, and in a very special way the pastors of rural churches.

Pledges Paid

The members of the Georgia Council of Town and County Pastors in their January meeting made pledges to be paid in by April 1. To the following pastors have paid their pledges: Reverends H. Vernon Greene, A. M. Reeves, A. L. McDonald and J. C. Solomon. List the cash pledges also.

The Rural Church Women
The Fourth Annual Women's Institute:

The Fourth Annual Institute for Town and Country Church Missionary Women was held at the Fort Valley State College, April 1-5. Forty-two women attended the institute. Without a doubt, the writer feels safe in saying that the fourth institute was the greatest of all the institute sessions. It is not by accident that this is so; it is the result of fellowship in service. It is the result of efforts put forth by the rural church women to improve their homes, their churches and communities.

Five Missionary Societies submitted written reports of their activities. By the decision of the judges there was a tie for first honor between Bethseda Baptist Church Missionary Society, Mrs. M. W. Reddick, President Americus and the St. James A. M. E. Church, Mrs. O. M. Roberts, president Adel.

The Leaders of the Institute were President C. V. Troup, Fort Valley State College; Mrs. A. L. Luce of Fort Valley, who was responsible for the morning devotions; Mrs. Rhussus Perry, representative of the Baptist Board of Missions of Tuskegee, Alabama, who conducted the following courses: "Programs of Missions for the Church and Community" and, Religious Education in Relations to Vocation Bible Schools; Miss Mary Branche, Instructor, of Health Education, Fort Valley State College, offered a course on "Family Relationship and Health;" Mrs. R. T. Hollis, President of Women's Connectional Council of the C. M. E. Church, Oklahoma City, Oklahoma; offered a course on "Leadership Training In Rural Mission Work." Mrs. Allee W. Green of the Department of Home Economic, Fort Valley State College, gave a course on "Helping Our Children to "Grow Up" in the Home."

The evening programs were conducted by the Georgia Council of Town and Country Missionary Women. On Tuesday evening, Mrs. R. T. Hollis represented the Council of Town and Country Women creditably on the College's weekly radio broadcast.

The Council elected the following persons to the staff of officers for the year 1946-47: Mrs. N. M. Beasley, President; Mrs. M. V. Harrington, Vice President; Mrs. Katie Stewart, Secretary; Miss Funnye Fruitt, Assistant Secretary; Mrs. Ella D. Glass, Treasurer. The Institute closed with a very fitting program to the College Assembly. For the hospitality so graciously offered by the Fort Valley State College they gave a resolution of thanks.

Rural Youth and the Community Vacation Bible School Conference:

For May 18, 1946, at the Stewart Chapel A. M. E. Church, Rev. A. R. Cooper, pastor, Macon, Ga. The Fifth Annual Vacation Bible School Planning Conference is scheduled. The time is 10 a. m. The conference is sponsored by the Central Georgia Vacation Bible Association, Mrs. Minnie H. Butler, Principal, Hazel Street Public School, Macon, Georgia, President. The theme is: "Christian Training for Balanced Living." The leaders of the conference are: Rev. T. Reid Lawrence, Director of Religious Education, Fort Valley District of the A. M. E. Church, and pastor of St. Peters A. M. E. Church, Fort Valley; Rev. A. R. Cooper, pastor Stewart Chapel A. M. E. Church, Macon; Mrs. Rubun Word of the Tatnall Square Baptist Church, Macon; Mrs. Bessie David of the Central Union Baptist Church, Fort Valley; Mrs. James R. Miller of the Vineville Baptist Church, Macon; Mrs. Lillian D. Edwards, Jeanes Supervisor Peach County, Fort Valley. The Pastors Missionary Society Presidents and Sunday School Superintendents are urged to send leaders to the conference to get the inspiration and information which will be helpful to them as they seek to administer to the religious needs of the children during the summer in their respective churches and communities.

On May 25, a similar Vacation Bible School Conference will be held in Thomaston, Georgia. Mrs. Evelyn Settles is the chairman of this district of the Vacation Bible School Association. The Conference will be held at the A. M. E. Church, the Rev. A. M. Threats, pastor.

Greetings to Graduates of Rural Public Schools:

During the month of May the majority of our County Schools will have their closing exercises. To the large number who will be graduating from the elementary and high schools I challenge you to higher heights, and nobler achievements. The challenge comes in the language of the poet, Rittenhouse, entitled "My Wage."

MY WAGE

"I bargained with life for a penny
And life would pay no more,
However I begged at evening
When I counted my scanty store;

For Life is a just employer,
He gives you what you ask,
But once you have set the wages
Why, you must bear the task.

I worked for a menial's hire,
Only to learn dismayed,
That any wage I had asked of Life,
Life would have paid."

The Crisis of Civilization:

In his book, "Christianity and the Cultural Crisis" Charles D. Keau discusses the "Crisis of Civilization. The author thinks that a crux of the crisis is involved in the reluctance on the part of the people to change. "It is our expression by uneasy anticipation of the difficulty of adjusting our ways of doing things to strange circumstances. There are both insecurity and uncertainty in the knowledge that governments after the war may have to evolve in previously unknown directions if they are going to function. On the other hand the "crisis of civilization" means that these are evidences of such a **profound cultural dislocation** that neither the buttressing of old forms of life nor the creation of new ones will by themselves insure tranquility."

This cultural dislocation is a significant factor with which contemporary civilization, and youth especially has to deal. The author feels that the attitude of objectivity, or view history as sequence of external and impersonal event for which one has no responsible part. "We cannot understand the meaning of history, and unless we appreciate its problems from the viewpoint of being connected with them, we cannot deal constructively with our contemporay world situation."

In this brief statement the writer has perhaps given a rather inadequate perspective of the contents of the book: "Christianity and the Cultural Crisis." However, it is my feeling that the author expresses a point of view that is well worth considering during these reconstruction days.

Here Miss White is shown performing her duties in one of the nutrition research laboratories. She prepares testing solutions, incubates samples, and in many other ways assists the chemist in charge. —Photos by Forsythe 6-10-46.

A Way To Solve The Rural Church's Financial Problems—Lord's Acre Plan

By Rev. E. T. Dixon

During the war years, the rural church's money problems increased. This was due to the fact that a large number of people left the farm for jobs in defense plants.

Now that the war is over, some people are returning to their farm homes. Some of them have seen well-organized churches as a strong force in various communities. These people, who till the soil for a livelihood, know that their church must remain a strong force in their rural communities. They know that their churches have many kinds of contests. They raffle cakes and quilts, and sell suppers to help finance the church More and more they realize that such practices are unbecoming to Christian fellowship.

There should be a plan that will bring money into the churches' treasury and yet remain a Christian plan. This plan should make use of the things at hand and still meet the needs of the church.

"The Lord's Acre" is just such a plan. It is a money-raising plan. It is a plan by which God can be related to the daily life of the people and the community. Nothing is needed but God's holy earth and a group of sincere people.

The Lord's Acre Plan is a plan which a member or members of a rural church can carry out. One can set aside and dedicate to the Lord a part of one's farm crop or farm stock. Then raise it, sell it, and give the money to the church. For example: One may dedicate a calf, pig, or chicken; or an acre of corn, or peanuts.

A small church in Masonville, New York, netted over $800 in one season through the Lord's Acre Plan. The pastor said, "Those who had been 'professing Christians' found that religion goes deeper when it gets into their muscles."

The rural churches can no longer remain poor and struggling. They must keep their rightful place in the communities and meet the needs of people.

—Negro Farmer.

AN EXPENSIVE WAY

With the introduction of the Wagner Murray Dingell compulsory health insurance bill, the old struggle of socialism versus private enterprise is back again. It doesn't matter whether it is fish and ships electricity, pills, or cigars, the socialist wants a government label instead of the trade mark of private enterprise.

Dr. R. L. Sensenich, testifying before the Senate Education and Labor Committee, said the bill which is designed to benefit those two poor to pay for medical service, is by no means cheap. In commenting on the estimate of Arthur J. Altmeyer, Chairman of the Social Security Board, that the cost would be about $27 a person a year, Dr. Sensenich figured that in a family of three, three times $27 would be no small contribution. He also made the point that even a system of compulsory health insurance will not bring medical service to those who are negligent of their health, and claimed that many of those who are not treated for ills today are among the groups.

The American Medical Association advocates a national program to improve the general health of the nation. Dr. Sensenich contends this could be accomplished by a voluntary plan or plans which would provide facilities for the care of the sick, with local government contributing necessary funds or facilities in especially poor areas. "The entire public should not be regimented into a plan to care for a relatively much smaller group." he said.

BELL BOTTOM TROUSERS

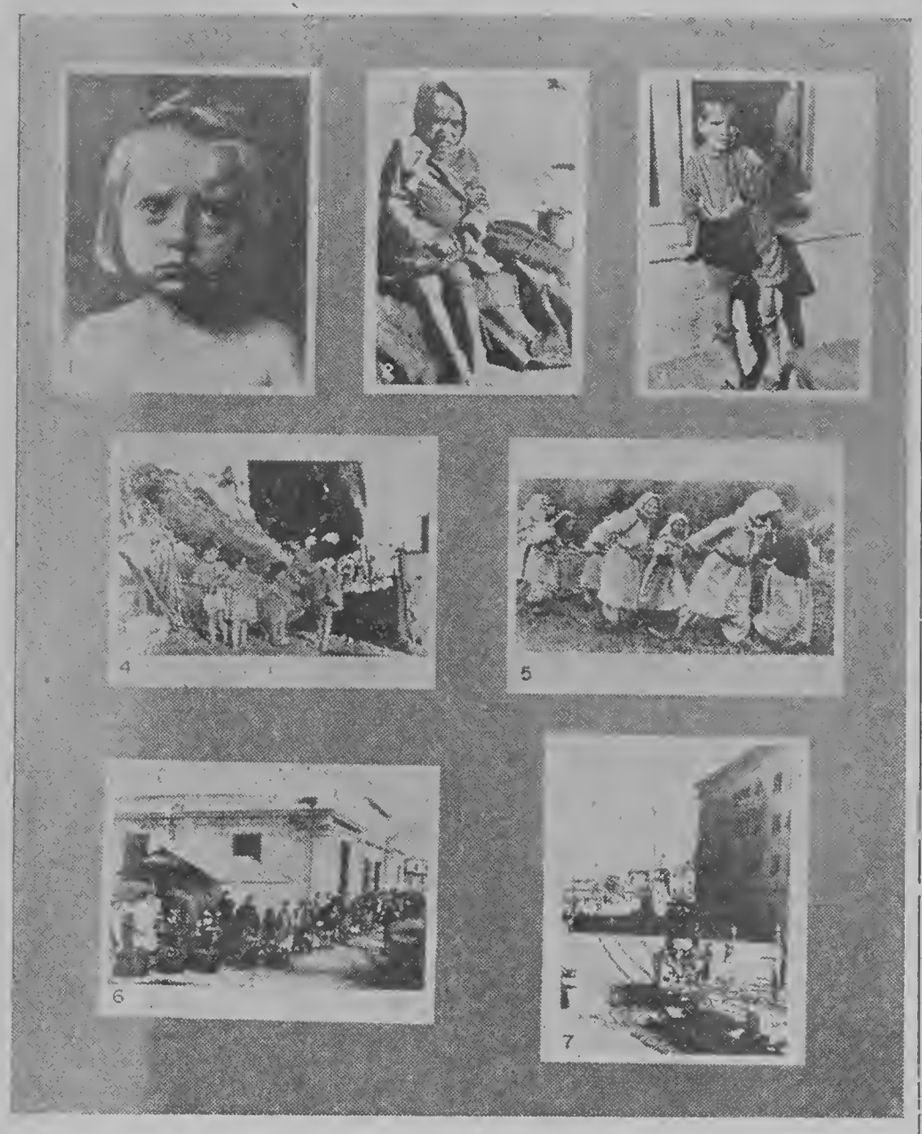
The ditty "Bell Bottom Trousers," may soon have the nostalgic note of "A Bicycle Built for Two" if efforts to change the sailor uniform are successful. Critics of the old uniform point out that modern ship facilities take much of the win out of the argument for the practicability of the traditional uniform left over from the days of wood and sail. Some of the older men in for the emergency feel that while the "monkey suit" may have a certain jauntiness on the youngsters, it does not lend dignity to age.

On the other hand, there is no getting away from the fact that a man-of-war's man with his present outfit can cruise for a year with no more than a scrubbling brush, a whisk broom and a little shoe polish, and look as smart on his first liberty as he ever did. The three creases in the collar, like the reverse seam creases in the "bell bottoms," are always there after being stowed in a seabag with seaman-like skill.

For years the male civilian has been adopting more and more the bluejacket's neckline in business, after knowing its comfort in sportswear.

Many an old Navy hand feels that when "the fleet's in" and a tide of battlejackets instead of bluejackets, overseas caps instead of jaunty flat hats, begins to roll down the street, "something about a sailor" will be gone.

WOMAN'S PAGE



AMERICAN FOOD WILL HELP THOSE WHO STARVE IN EUROPE

(1) SHE DOESN'T UNDERSTAND what tuberculosis is, but she is only one of the thousands of Czechoslovakian children threatened with death by this dread disease. Tuberculosis often results from lowered resistance due to insufficient food. Americans can help to replace the sorrowful look in this child's eyes by saving on bread, fats, and oils, and so releasing more food for the hungry.

(2) "MALNUTRITION" — Lack of enough of the basic foods—did this to the Greek child shown in this picture and thousands like her. Only food from America's abundance will help. Wheat, fats and oils—that is the need.

(3) TO BUILD PEACE, WE MUST FIRST BUILD MEN.—But this little Greek boy, a victim of malnutrition, will make no contribution, unless he gets healthful, nourishing food at once.

(4) CAVE DWELLERS OF EUROPE, 1946 STYLE — Ragged, hungry children living in caves—that is the fruit of Europe's "Victory Garden" this year. Americans are diggins in Victory Gardens all over the country to help in feeding the starving millions while UNRRA is moving cave-dwellers like these near Naples to more habitable quarters and replacing their rags with decent clothing. Five hundred people, including 200 children, have been living in this cave near Naples.

(5) PRODUCING FOOD THE HARD WAY is the only way open to these Yugoslav peasants. With machinery destroyed by war, Europe's millions are making every effort to feed themselves by forming human plow teams such at this But the time is now. Hunger will not wait for the next crop. The children of these peasants are starving now. And now is when they need all the food America can possibly ship.

(6) CHOW LINE—These Italians are fortunate—for the time being. But many milions of their neighbors are starving. Americans are asked to help save them by reducing wheat consumption and the use of fats and oils. A record U. S. production makes it possible for Americans to give life to these famished millions.

(7) "THE FOOD'S IN"— and with it, new hope of life for starving thousands. Shown in this picture is the arrival of UNRRA wheat in Sibenik, Yugoslavia. Requests for wheat have been received in such volume for all European countries that almost unlimited supplies can be used.

While Americans are eating better than ever before, more people in Europe and Asia face hunger, malnutrition and actual death by famine than at any time during the war. In some countries of Europe, the average amount of food available per person is down close to 1,000 calories a day. That means a total daily ration of all kinds of food equal to 10 bare slices of bread. It is less than one-third the average food consumption in this country.

That, briefly, is the food situation in great areas of the world. The United States is the main hope for staving off mass starvation.

Household Hints

If you are packing your woolens away in boxes or trunks, use plenty of moth flakes or crystals. Usually four ounces will give protection, but it's best to overdose and be safe.

When your recipe calls for sour milk and none is available, extension nutritionists suggest that you make your own sour milk. The usual ratio is one tablespoonful of vinegar or lemon juice to one cup of milk.

If cream is to be kept after whipping, keep it in the coldest part of the refrigerator.

Wash your brooms occasionally for best results, shake out water, and hang with handle down.

Mend rips and tears, darn or patch worn places, and sew on loose buttons before washing garments. Always close zippers before washing.

To get the best use from fat in cooking as well as save it for use gain, heed the "no smoking" rule. When fat is overheated and reaches the smoking point, it starts to break down chemically. To prevent fat from smoking, keep the heat low when melting fat for sauce or pan-frying. Cook meat at moderate temperature which is best for the protein as well as the fat.

Before handling fish, chill hands thoroughly in cold water and this will prevent the odor of raw fish from clinging to the hands. After handling fish, wash hands in hot water and salt before using soap.

The pan and its handle should be well balanced so that the pan stands steady even when empty. Too heavy a handle makes a tipsy pan that is awkward and may cause dangerous spills of hot water or feed.

One small serving of potato can replace a slice of bread nutritionally, and the potato offers some vitamin C besides.

TATERS, TOMATERS, GREENS

Turnip green, hog jowl and cornmeal dumplings is a combination which sets Southern mouths to watering, and justifiably, at its very mention.

By MARY LYLES WILSON

The very mention of turnip greens, hog jowl and cornmeal dumplings, a combination of delicacies long claimed by the South as its very own, is enough to set any good Southern mouth to watering.

Served with a casserole of candied sweet potatoes and its already-abundant vitamins enhanced by celery, radishes and carrots, this meal-in-one dish is a natural for the springtime. Nothing can compare with the aroma of fresh greens cooking, and the proper treatment afterwards involves sprinkling chopped up onion and a few drops of sweet vinegar over the greens, flanking them with a piece of browned bacon and pouring a little melted butter over the cornmeal dumplings. Find a more toothsome treat if you can!

In the South, we feel that there is only one way to cook turnip greens—with hog jowl, salt pork, ham hock or meat drippings. Perhaps this isn't the most healthful way to treat greens, but it's mighty good and we like it that way. However, greens may be cooked in clear salted water until tender—about 20 to 30 minutes, depending on their age and size—and then chopped up and seasoned with bacon drippings, melted butter or margarine.

Various types of greens, including mustard, kale, turnip greens, poke salad or spinach, may be combined. Hard cooked or poached eggs usually accompany greens, especially when the greens are not cooked with meat.

To compliment a platter of greens, you might try macaroni and cheese, stuffed baked potatoes, baked tomatoes with corn, curried rice, or chicken and noodles en casserole, any of which would be good.

A menu I like includes mixed greens, cooked in clear water, spaghetti casserole ring, cornmeal muffins and baked peach dumplings with peach sauce. Another one consists of turnip greens with bacon squares, macaroni, vegetable salad, hot fried corn cakes, sliced onion in spiced vinegar and apple delight.

Turnip Greens—Bacon Squares or Jowl

Select tender young greens. Look over each leaf. Break off any stems that are large or tough. Let stand in cold water, to which a teaspoon of salt has been added, for 30 minuttes. Wash through five or six waters. In this way all grit will be removed. Place in pot with the meat which has been cooked 30 minutes in enough water to cover well. Cover and cook slowly one to one and one-half hours. The last hour of cooking drop in cornmeal dumplings. Serve as pictured, with bacon, which has been removed from greens and browned on the surface in a skillet, in the center of the greens and dumplings around it.

Cornmeal Dumplings.

2 cups cornmeal
1 teaspoon salt
4 teaspoons melted fat
Liquor from greens

Combine cornmeal, salt and fat. Make into a soft mush with pot liquor from turnip greens. Chill before molding into balls or cakes. Drop into boiling greens. Cover and steam one hour.

To glamorize cooked macaroni build it into an attractive nest and fill with leafy cooked spinach topped with sliced hard-cooked eggs in white sauce. This delightful entree takes only 15 minutes to prepare. While the macaroni is cooking, make a satiny white sauce, hard cook the eggs, and cook the spinach. With this dish, serve assorted relishes and rye bread and for dessert, sliced peaches with peanut butter cookies.

Spaghetti Casserole Ring

1 tablespoon salt
3 quarts boiling water
6 ounces long spaghetti
2 tablespoons fat
1 12-ounce can table-ready meat
2 tablespoons minced onion
1 4-ounce can mushrooms
3-4 cup cooked kidney beans
1-2 teaspoon salt
1-8 teaspoon pepper
3-4 cup grated American cheese
1 teaspoon Worcestershire sauce
1 cup condensed tomato soup
1-2 cup water

Add one tablespoon salt to actively boiling water. Gradually add spaghetti and continue boiling until spaghetti is tender (about 12 minutes). Drain and rinse spaghetti. While spaghetti is cooking, melt fat in skillet. Cut meat in half-inch cubes. Brown meat and onion in fat (about five minutes). Remove from heat, and add mushrooms, beans, one-half teaspoon salt, pepper, cheese, and Worcestershire sauce. Arrange spaghetti around edge of greased one and one-half quart casserole, pressing it against edge of dish to form a ring. Place meat mixture in center. Combine soup and water. Pour soup mixture over spaghetti. Bake in moderate oven (375 degrees F.) about 25 minutes. Serve hot. Serves four.

Macaroni Taste-Teaser

1 tablespoon salt
3 quarts boiling water
6 ounces elbow macaroni
1-4 cup margarine or butter
1 1-2 cups grated American cheese
1-4 cup chili sauce
3 tablespoons Worcestershire sauce
1-2 teaspoon salt
1-8 teaspoon pepper

Add one tablespoon salt to actively boiling water. Gradually add macaroni and continue boiling until macaroni is tender (about eight minutes.) Drain and rinse macaroni. While macaroni is cooking, melt margarine or butter in skillet. Combine cheese, chili sauce, Worcestershire sause, one-half teaspoon salt, pepper, and macaroni. Add to melted margarine or butter. Heat thoroughly, stirring occasionally. Serve hot. Serves four.

Macaroni Vegetable Salad

1 tablespoon salt
3 quarts boiling water
6 ounces long macaroni
1-2 cup salad dressing
1-2 teaspoon celery salt
1 teaspoon salt
2 tablespoons French dressing
1-4 teaspoon prepared mustard
1-2 cup shredded carrots
1-2 cup diced celery
1-4 cup chopped green pepper
1 tablespoon minced onion

Add one tablespoon salt to actively boiling water. Break macaroni into short pieces and gradually add to boiling water. Continue boiling until macaroni is tender (about 10 minutes). Drain and rinse macaroni. While macaroni is cooking, combine salad dressing, celery salt, one teaspoon salt, French dressing, and mustard. Mix well. Add celery, carrots, green pepper, and onion. Fold in macaroni. Chill thoroughly. Serve on lettuce leaves or beds of watercress. Serves four.

Apricot Roll Pudding

1 cup canned apricot halves
1-2 cup pitted chopped dates
1 cup chopped roasted blanched almonds
1-3 cup honey
Few grains salt
1 teaspoon vanilla extract
1 1-2 cups finely crushed melba toast crumbs
Vanilla custard pudding

Chop apricots fine and drain. Combine with dates, one-half cup almonds, honey, salt, flavoring and toast crumbs. Blend thoroughly and form into roll about two inches thick. Roll in remaining almonds. Wrap in waxed paper and chill thoroughly. Cut in thin slices with sharp knife. Serve in stemmed dessert glasses, alternating each slice with a layer of vanilla pudxding. Serves 10.

Apple Delight

6 medium-sized tart apples
6 pecans
1-8 teaspoon powdered allspice
Dash powdered cloves
1-2 tablespoons stale cake crumbs or sweet cracker crumbs
4-8 tablespoons honey, corn syrup or molasses
4 tablespoons fortified margarine.

Wash, quarter, core and slice the apples. Arrange in glass pie plate in decorative pattern. Crush or cut up the pecans. Add allspice, cloves, cake crumbs and sprinkle over top. Mix water with sweetening. Pour over top. Dot top with margarine. Bake in moderate oven, covered, about 40 minutes. Serves four.

Ham-Macaroni Salad

1 16-ounce package elbow macaroni
1-4 cup vinegar
2 cups diced cooked ham
1-4 cup chopped pimiento (optional)
1 cup chopped celery
1-4 cup grated onion
2 teaspoons salt
1-2 teaspoon pepper
1-2 cup mayonnaise or salad dressing
Lettuce or greens
1 fresh tomato

Cook macaroni in boiling salted water until tender; drain. Pour vinegar over macaroni and let stand 10 minutes. Toss all ingredients together except greens and tomato. Pile salad on crisp greens, and garnish with tomato wedges. Serves 8 to 10.

Deviled Eggs

4 hard cooked eggs
1-2 teaspoon prepared mustard
1-2 teaspoon salt
1 1-2 teaspoons vinegar
3 tablespoons milk

Cut eggs in halves lengthwise. Remove yolks and press through sieve. Add prepared mustard, salt, vinegar, and milk and mix until light and fluffy. Fill egg white halves with yolk mixture.

TRY THIS FOR YOUR PICNIC

Carrots and Peas in Parsley Sauce

1 cup milk
2 tablespoons enriched flour
2 tablespoons margarine or butter
1-2 teaspoon salt
1-4 cup chopped parsley
1 cup sliced cooked carrots
1 cup cooked peas

Make a thin paste of flour and one-fourth cup milk. Put remainder of milk, margarine or butter, and salt in top of double boiler. When hot, add flour-milk mixture, stirring constantly until thickened. Add carrots, peas and two tablespoons parsley. Serve hot over slices of Bologna on toasted bread. Sprinkle with remaining parsley.

If you prefer to serve plain hamburgers instead of cheeseburgers, here is a springtime casserole that will be most satisfying with them.

THE MODERN FARMER

VOL. XIX. NASHVILLE, TENN., JULY 15, 1946 No. 6.

Charlie M. Jones, World War II Veteran Returns To Farm

What Think Ye Of Christ?

By Rev. Bernard O. Byrd

Guest Column
Editor Out of City

In this age opinions of things and men are more freely exprest than at any other time of my two score years of living. Generally it is not necessary to ask one what his opinion on a certain thing is, because men volunteer to express their thoughts. There is at least one exception to the foregoing statements: men do not express their opinions of Christ as freely as they should.

Christ Himself is anxious to hear the world express its opinion of Him. When He lived in the flesh, He asked for the opinions of men. "Whom do men say that I the Son of man am?" Whom do ye say that I am?" are proof that He wanted personal expressions. These words were Christ's words. On another occasion we find Him saying, "What think ye of Christ?" "Whose Son is He?" Evidently these men to whom Jesus spake, had expressed themselves concerning other men, and other things, but they had not expressed themselves on the subject of Christ.

Without a doubt, the world is losing much good by confining its expressions of opinions to the secular things of life. The writer does not wish the reader to misunderstand him. It is fully realized that many persons are telling others what they think of Christ, but the majority has its minds and conversations centered around other things. If the question is asked, "What think ye of modern music?" their will be diversities of opinions and many reasons for these opinions. Men are ready to answer when asked, "What think ye of the gambler?" "What think ye of the dancer?" "What think ye of the organization called the Church?" "What think ye of the liar?" "What think ye of the home-breaker?" In studying the answers, you will find that some opinions are justifiable and some are ungrounded. We cannot have the correct opinion of things until we enter the realm of correct observation and fair judgment. Neither can these things exist until we have gained the proper thinking about Christ.

My thoughts concerning my fellowman are measured largely by my thoughts of Christ. Honest thinking about Christ, filters one's mind that he may think clearly about other things. True thinking about Christ takes away prejudice, partiality, misunderstanding, lack of proper consideration, biased attitudes hatred and egotism. These bits of trash in the water of our minds make our opinions unsafe, and some times dangerous.

It is the writer's opinion that the world should devote more of its thinking to Christ. Our opinions of the church or of society may be correct, and yet not helpful. A man's opinion of society is getting rotten. Perhaps in many instances it would be right, but he has not helped society or himself unless he has centered his thoughts upon what Christ would do when He finds society rotten. One may say, "I think the church is weak." If we judge by some who claim to be factors in the church we must agree, but in thinking of Christ, we find

Farm Employment Up 267,000 In South

Washington, D. C., June 24, 1946. —There were 267,000 more white and colored family workers and hired hands employed on farms in the South on June 1 than a year ago, the Bureau of Agricultural Economics of the U. S. Department of Agriculture reports.

The largest increase occurred in the West South Central region—Arkansas, Louisiana, Oklahoma, and Texas—where total farm employment increased from 1,911,000 on June 1, 1945, to 2,045,000 on June 1 of this year.

Hired workers accounted for 21.6 per cent of the increase. Similar increases occurred in Alabama, Mississippi, Tennessee, and Kentucky.

However, total farm employment in the South was nearly a million less on June 1 than for the same date during the prewar period (1935 39). But wages averaged three times as much as before the war.

BAE also reports that through the Extension Service farm labor program, 58,191 white and colored veterans of World War II were assisted in finding farm employment between January 1945 and April of this year.

NEGRO FCA AIDES RETURN TO CAPITAL

Cornelius King and Lawrence J. Washington, information aides of the Farm Credit Administration of the U. S. Department of Agriculture, have returned to Washington with the agency which moved back from Kansas City, Mo., a few weeks ago. FCA moved to Kansas City in the course of the wartime decentralization of the Government.

Mr. King and his assistant, Mr. Washington, perform the important function of keeping colored farmers informed on credit services available through FCA. Individual colored farmers have borrowed as much as $11,000 through FCA.

Pig Crop Drop Forecast

Washington, June 29—(AP)—The Agriculture Department this week forecast a 1946 pig crop of 81,500,000 head or about six per cent less than last year and the smallest since 1940.

This reduction will be reflected in smaller supplies of pork in butcher shops during the late winter of 1946 and spring and summer of 1947.

Charlie M. Jones of Linwood, Alabama

CHARLIE M. JONES, World War II veteran, of Pike County, Alabama, poses with the mule that he purchased with a Farm Security loan. May 1946.

7,000 West Indies Workers Employed On Southern Farms

Nearly 7,000 of the 18,000 West Indies Agricultural workers in this country are employed on farms in the South, the Labor Branch of the U. S. Department of Agriculture reports.

About 6,000 of the West Indies workers employed in the South are working in Florida, cultivating sugarcane and cultivating and harvesting truck crops. The others are employed in Alabama, Georgia, and Virginia. North Carolina is to have 1,200 Bahamian men and women on its farms within a few weeks. The prevailing wage for the foreign workers in that State has already been set at 50 Cents per hour for men and 40 Cents per hour for women. However, the prevailing will not affect those who work on a piece-rate basis.

The West Indies workers contingent is composed of 10,000 Jamaicans, 5,000 Bahamians, and 3,000 Barbadians.

MILK AND COTTON A GOOD COMBINATION

Sixty colored farmers of Tallapoosa County, Alabama, have found milk and cotton to be a good combination for an assured year-round income, according to a report received by the U. S. Department of Agriculture from the

(Continued On Page 4 Col. 1)

Negro Farmers Net $900 By Scaling Timber

Two colored farmers, Arnie Royster and W. B. Brooks of North Carolina, netted $900 by consulting with a farm forester and having their 17 acres of timber scaled, according to reports received by the U. S. Department of Agriculture from North Carolina Extension Service.

The farmers had been offered $3,100 for their timber by sawmill men, but refused to accept the offer until the timber could be scaled. It turned out that the 17-acre tract contained 300,000 feet of lumber which brought a scale price of $4,000.

DEPARTMENT OFFICIAL AD DRESSES CHURCH CONGRESS

Clyde F. Clark, educationist of the U. S. Department of Agriculture's Field Service Branch, addressed the National Sunday School and Baptist Young Peoples Union Congress in Chicago on June 19.

Discussing the urgent world food situation, Mr. Clark pointed out how the young people of the church could help make a further contribution toward relieving starvation in Asia, Europe, and Africa. And he praised the nation's colored farmer for the important part they are playing in helping to produce more food by using modern farming practices and increasing the productivity of their land.

Resident of Linwood, Pike County, Alabama Wants to Build Home

Washington, D. C. — Charlie M. Jones, Negro World War II veteran, Route No. 1, Linwood, Pike County, Alabama, home unscathed after several years service in the South Pacific, stood in the yard of his mother's home and pointed to a clump of trees across the road. "Right there," he said, "is where I want to put me a house among the trees and for the rest of my days do nothing but farming out and out."

Jones was asked when he first decided that he would round out the rest of his days on a farm in Pike County.

"The day they put me on that ship to send me to the South Pacific was the time I made up my mind that if I ever get out of the Army alive I was going to do some farming right here from then on," he replied.

When Jones was discharged on January 1, 1946, he applied to the Farm Security Administration for a rehabilitation loan of $410 with which to purchase the mule, seed, feed, fertilizer and plow tools he needed to get a new start in farming. His application was approved by the County FSA Committee. He is renting 40 acres and with his wife and two children lives at the home of his mother who owns an 80 acre farm.

Jones entered the service in November 1943 and received training at Camp Barkley, Texas. Thereafter he saw service in New Guinea, the Dutch East Indies and the Philippines, while attached to the 728th Medical Sanitary Company on hospital duty and on first aid duty on the battle field.

He came through without a scratch and according to his own statement he is "just a lucky man."

His crop plans for the year include 10 acres of cotton, 10 acres of peanuts, 12 acres of corn and 3 acres of truck crops. He also plans to plant 10 acres in winter legumes next fall.

Governm't Capital In Production Credit System Being Reduced

Washington, D. C.—Government capital in the production credit system has been further reduced by the return of $7,050,000 from the production credit corporations to the Revolving Fund of the United States Treasury, C. R. Arnold, Production Credit Commissioner of the Farm Credit Administration, recently announced.

In three successive annual payments, $18,750,000 of the capital which the Government originally invested in this short-term credit system has been returned. Repayment of Government capital has been made possible by the progress in member ownership of the cooperative production credit associations, according to Commissioner Arnold. As the farmer-owned capital increases and the associations accumulate earnings, the need for Government capital decreases, he pointed out.

Farmer-owned capital of the 506 production credit associations of the country amounted to $34,224,000 as of April 1, which with $36 million of accumulated earnings, represented 58.7 percent of their total net worth, Arnold said. Stockholders in the production credit associations have increased in number each year since organization 12 years ago, he reported, and now total over 370,000.

First Cotton Bloom

Huntsville, Ala., June 20—)Special)—The first madison County cotton bloom of the season was brought to the county farm agent's office this week by Wright Caudle, Negro farmer of Madison precinct. It is nearly a week earlier than the average, and cotton experts declare it is earlier than any other on record. Caudle planted the nine-acre field from which the bloom was taken last April 2.

American Bonfire

France has her eternal flame which tourists may visit, but that is nothing compared to America's perpetual bonfire that roars along to the tune of a half billion dollars' worth of property annually.

In April alone the American bonfire consumed $52,000.000 worth of homes, farms, hotels, restaurants dance halls and heaven alone knows what else. It is getting hotter all the time. Currently it is burning at a rate that has never been equaled since the National Board of Fire Underwriters began compiling losses sixteen years ago.

One of the most effective ways to ease the housing shortage would be to use a little more care where fire is concerned. There are very few unavoidable fires. Cigaretts and matches are the great destroyers. Greater caution in the use of these two items alone would work miracles.

Next to preventing destruction, the most important consideration is the rising cost of the fuel that keeps the American bonfire blazing. Property values are rising rapidly—so rapidly that contractors hesitate to commit themselves on building costs. This means that fire insurance policies can become outdated. A fully insured home of ten years ago would be only about half insured now with the same dollar coverage. Insurance companies are trying to impress upon the insuring public the insidious menace of inflation to yesterday's insurance policy.

Next month another forty or fifty million dollars' worth of property will disappear in smoke and flame. Night and day the awful pageant will go on, until the American people realize their bonfire is a disgrace to the nation—then maybe they will do something about it.

Rural Electrification And Main Street

Farmers have been the prime beneficiaries of the REA program. No one can question advances brought to the farm by electric power. . .

Our Government, through REA, has invested upward of $450,000,000 to bring light and power to 1,400,000 rural users. And the rural people who have been aided by that program have spent at least an equal amount for house wiring, for electric appliances and equipment, for plumbing and for farmstead renovation. . . .

Electricity has proved to be a money-making tool for the farmer. He has used it not only to lighten his own labors but to increase his farm revenue. Therefore, in addition to the direct investment of large sums of money for labor, supplies, appliances, and equipment, rural electrification has had an important secondary effect on Main Street's prosperity.

If this country is to experience any great future exodus from rural to urban areas, the migration is least likely to occur from farms and farm areas which have been aided by electricity.

—**Claude R. Wickard**, in Rural Electrification News

Had The Doctor Lately?

A one-man farm could be run for 123 years on the estimated man days lost each year through farm accidents.

Still worse is the fact that carelessness and lack of safety measures on farms cause a death rate greater than in all other occupations combined. During World War II action of the enemies resulted in the death of 261,608 men. At the same time home accidents in this country killed 335,000 persons and injured 36,000,000.

These thoughts should make every member of the farm family sit down and take stock. To decide how in their own jobs on the farm the risks and carelessness can be removed to make the jobs safe. As all farm people join in the observance of National Farm Safety Week, commencing July 21, safety precautions on the farm become an important item for all of us.

Farmers have been called upon to produce food abundantly to help feed the millions of starving people in other nations. They are asked to make their farm as efficient as possible so that we here in the United States will not have to undergo undue shortages. To produce efficiently and at a maximum, there is no place for lost days due to accidents. Nor is there a place for lost time and production due to a more serious cause—death.

President Truman, in his proclamation of National Farm Safety Week, suggested a start all farm families can make. He asks farm people to resolve to eliminate at least one hazard a day until their farms are as safe as they can possibly make them. By taking the risk out of each job—even if just one day—health and life can be prolonged on every farm.

The President's suggestion was not directed at just the farmer. To be sure, phenomenal advances in farm mechanization have resulted, thought not necessarily so, in more farm accidents on the farm. Farmers continue to jump off the tractor while it is still running; they allow children and other people to get on the tractor while it is in operation and they disregard safety rules and safety guards provided by manufacturers on tractors and other farm machinery.

The president was talking to farm women and children as well as to farmers. Falling down the steps, pulling hot pots of liquid off the stove, trying to become an expert electrician in a matter of minutes, trying to save meat of vegetables with the mind or eye on something else—these and many more housekeeping pitfalls gain victims every day. The kitchen is said to be the most dangerous room in the house. Dangers in the other rooms are less severe. In all of their work the farm women must be as careful as farmers must be in their outside work to prevent accidents and death. They have themselves and children to protect.

When we stop to realize that twenty-five per cent of all occupational deaths occur on the farm and that twenty-five per cent of the home accidental deaths occur in the farm home, it becomes clear that its time to stop and think. National Farm Safety Week is a start, but it most assuredly should not be the end, of reducing death an injury in farm life. Farming can be a pleasant way of living. It need not be an easy way of being injured or killed.

Basic USDA Food Conservation Guide:

Washington, D. C.—(Note: The Department of Agriculture has had many requests for basic food conservation recommendations during the famine emergency, in addition to the various specific how-to-do-it advices the Department has issued for homemakers, public eating places, and the food trades.

Requests have come from writers, speakers, and leaders or organizations who either in their professional capacities or as volunteers, are rendering a public service of information helpful to the famine emergency program.

In response to these requests, the Department has issued the following food conservation recommendations, which had been prepared primarily as a guide for copy writing for use within the Department. They are being given wider distribution in anticipation of the need for a conservation guide. Additional copies are obtainable on request from the Department's Press Service, Office of Information.)

The critical stage of the world famine emergency is expected to last until new harvests are moving freely. The United States as the best fed nation in the world and the nation with the largest available resources for supplying starving peoples can afford to tighten its belt and modify its customary wasteful eating habits in order to increase the size of a lifesaving exportable surplus. The United States can make a sizable contribution to famine-stricken Europe and to the Far East without impairing the essential nutritional value of our diet here at home.

Of the foodstuffs most useful in meeting the present emergency, cereal grains and fats and oils are outstanding, with wheat easily topping the list. Wheat is the one foodstuff the United States can export that will best do the feeding job that needs to be done—and do it quickly. To make the largest amount of wheat, rice, and other cereals, and of fats and oils available for shipment abroad immediately, the U. S. Department of Agriculture makes the following recommendations to the American people:

1. Conserve Food in Every Possible way

Avoid waste. Prepare no more food than your family needs. When ever possible, use left-overs and reuse cooking fats. Let no usable food end up in the garbage can. Eat less. If you customarily overeat — as many of us do—now is the time, of all times, to help yourself to health and your world-neighbor to life.

2. Eat Potatoes Instead of Bread, Rice, and Other Cereals

Throughout the country, potatoes are plentiful. They are reasonable in price, and they are an acceptable alternate for cereals during a period of emergency. We can ship abroad all the wheat, flour, and other cereals we can get to our ports, but we can ship only limited quantities of potatoes because they are too bulky and perishable to ship except in dried form.

3. Eat Cereals Sparingly, Particularly Wheat Products

All Cereals are important in the famine emergency. Drain on the supply of any one increases the shortage problem for the whole group. We must save in the use of all of them. It will often be desirable, where supplies are available locally, to use oatmeal and cornmeal instead of wheat and rice —which are the most urgently needed cereals for relief shipment.

4. Use Less Fats and Oils

Bake, broil or steam meats, poultry and fish instead of frying them. Avoid deep-fat frying of foods. Save all meat drippings for seasoning vegetables and other foods. When you no longer can re-use fats for food, turn them in for salvage so they can replace edible fats and oils in the manufacture of soaps and other essential products.

5. Eat Fish, Aggs, and Poultry—Which are Relatively Plentiful

Fish stocks—particularly frozen fish—are at an all time high. We are entering the season when eggs are abundant, and in most areas poultry supplies are plentiful. Use of these plentiful proteins—especially in connection with plentiful vegetables—will do much to compensate for reduced consumption of cereals and will help to relieve the demand for beef, pork, and lamb, which are much needed abroad and will be short of demand.

6. Eat Locally Abundant Vegetables

Fresh vegetables are and will be abundant in many areas. Many must be used locally or be wasted. Use them. These vegetables add much to the palatability, variety, and nutritive value of the diet. If you can possibly grow your own vegetables, do so.

7. Produce Food If You Can

In order to help starving people through the 90-day pre-harvest crisis, the United States is drawing upon reserves of food usually carried over. It is doubly wise to rebuild these reserves, for while the pre-harvest crisis may be relieved by new crops, need for food throughout the world will remain large throughout 1946. For these reasons, farmers are asked to continue or increase their production efforts. Victory Gardeners are asked to keep their gardens growing. Housewives are asked to can surplus fruits and vegetables.

8. Share—Don't Hoard

Hoarding is often a prelude to waste. Sharing defeats waste—frees needed supplies for shipment abroad.

4-H Club Activities In Georgia

By Augustus Hill, Assistant Negro State Club Agent

The term "cooperation in action" was certainly exemplified recently in Greene, Morgan and Liberty counties. It was in these counties that unusual interest was observed in 4-H Club work between county agents, 4-H Club members and local citizens.

Sometime ago county and home Extension agents were asked to solicit funds to help build a State camp for Negro 4-H Club members of Georgia. As to how they would go about raising these funds was left entirely with each agent. From all indications, any number of methods are being used to carry out this request.

In **Greene county,** Agent C. L. Tapley sponsored a popularity contest between twelve community 4-H clubs. Handsome prizes, consisting of a lady's Bulova wrist watch, Ever Sharpe fountain pen, lady's lockette and photo album, were awarded the leading contestants in this event. The top winner of this contest was crowned "Miss Greene County of 1946."

Below is a summary of Mr. Tapley's 4-H Club contest:

Financial Report

Union Point	$164.60
Greensboro	100.00
White Plains	52.48
Andrews Grove	31.00
Woodville	27.00
Alexander Center	26.35
East Over	25.00
Siloam	19.01
St. Paul	7.60
Brown Chapel	6.75
Total	$521.29

Winners

1. Miss Julia Saggus, Union Point School, Sponsor: Mr. H. W. Tapley.

2. Miss Kathleen Smith, Greensboro High School, Sponsor: Miss Ethleen Barnhart.

3. Miss Edna Mapp, White Plains School, Sponsor: Miss Elvira Greenard.

4. Miss Bessie Twilley, Andrews Grove, Sponsor: Miss Bessie Stephens.

Over in **Morgan county,** Agent L. C. Trawick, Jr. held his annual 4-H Club picnic and also the crowning of the "4-H Club Queen for 1946." Approximately 600 4-H Club boys and girls, teachers, preachers, doctors and local school officials attended this affair. Reverend W. M. Mitchell and wife were host and hostess to the group. Rev. Mitchell is principal of one of the schools in Morgan county and also a 4-H Club advisor. An excellent program was rendered during the day with 4-H clubsters, teachers, preachers, school officials and all taking part. Out door activities consisted of soft ball games, sack races, ring plays, etc. All seemed to have enjoyed this beautiful day of fun.

Mr. Evans B. Cooper and Miss Mattie Mathis, the county and home agents of Liberty County sponsored a similar program to that of Mr. Tapley's 4-H Club Rally Day. More than 700 clubsters, State Extension officials, teachers and preachers attended the program.

Liberty county's program for the day was as follows:

1. Devotional Exercises.
2. Discussions: Coming Events on 4-H Club Calendar. 4-H Club Boys: Mr. Augustus Hill, Asst. Negro State Club Agent. 4-H Club Girls: Miss Camilla Weems, Asst. State Agent for Negro Work.
3. Folk Dance, Virginia Reel.
4. Intermission: May Pole Dance.
5. Movie.
6. Rally and Dismissal.

Liberty 4-H Club contestants reported over $200.00 in this drive.

A MEDAL FOR BETTY

Betty Hunkin, a slim, dark Welsh girl, was regarded as one of the most efficient nurses in the British Army hospital in which she served in India.

Betty was the shy, quiet type, always pleasant but with little to say as she moved among the sick and wounded, applying an ice pack here or a fresh dressing there.

"A model nurse, but too diffident ever to command others," her superiors thought.

No one suspected that Betty had the making of a heroine—not until recently, when angry shouts and a death scream broke the mid-day quiet in the hospital at Trimulgherry.

The uproar came from a ward filled with tough, bearded Sikhs, most of them convalescents. It wasn't Betty's ward, but she ran toward it without hesitation. A stream of frightened nurses and patients erupted from the door. Betty kept going.

Pressing through, she found herself in the midst of a swirl of angry, yelling Sikhs, slashing at one another with knives. Five minutes before they had been disciplined soldiers of the British Raj. An insult had been passed, men had taken sides, and now they were milling tribesmen with murder in their hearts.

Betty stepped over one bleeding form and jammed several warriors aside with her elbows.

"Stop it!" she cried. "Stop it—this instant!"

Soldierly training reasserted itself as the Sikhs recognized the voice of authority. Reluctantly they lowered blood-stained knives and stepped back.

Only one disobeyed. A bearded giant, the ring-leader who started the battle, turned and fled. Betty pursued and cornered him in the garden. She advanced, despite the weapon which he waved menacingly.

"Give it to me," Betty ordered, holding out her hand.

For half a minute the Sikh glared at her defiantly. The slender nurse's eyes didn't waver. Furious, but afraid to strike, the Sikh finally held out the knife, handle first, and submitted to arrest meekly.

One man was dead and many had wounds. Betty helped care for them and went back to taking temperatures in her own ward—without a word about her exploit.

There was plenty of talk about it latter, however, when Betty Hunkin was called before a visiting general, while her sister nurses stood at attention on the parade ground.

The general said Betty's action was one of the most courageous in the annals of the nursing corps and he pinned the medal of a Member of the Order of the British Empire on her starched, white uniform. Betty stammered her thanks. When friends pressed congratulations on her afterwards, she made only one comment:

"What I did wasn't much. My Uncle Vickery, now, saved a wounded comrade under fire and killed three eñemies while he was doing it. They gave him the Victoria Cross. Now he's my idea of a real hero."

"In times of trial," said the preacher, "what brings us the greatest comfort?" And from the back row an answering voice: "Acquittal!"

Motor-Driven Hay Hoist Time, Labor Saver on Farm If Properly Installed

By Kenneth B. McPherson

This is the hay making season and it will continue until frost. Regardless of the kind or type of hay, whether it be baled or loose, it must be stored. That storage means lifting, not just pounds, but many tons.

Hay may be lifted or hoisted with a pitch fork, a horse, a team, a truck, a tractor, or a motor. A motor driven hay hoist may be a great convenience, and a time and labor saver, or it may be just another gadget, depending on how one rigs it up and uses it. A hay hoist installation should be designed to save man labor and horse labor at a time when both man and horse labor are at a premium.

The advantage of an electric hay hoist is not just in the fun of using it, or in saving time. Haying is a time of peak demand for both horses and men on the farm. The hoist saves a man and a horse, and it does not eat anything when it is not in use. The hoist is useful at other times for handling bated straw or sacked grain with slings. It can be used profitably at any place where heavy loads are lifted frequently.

Several Types

There are several types of hay hoists on the market, some of which are available now even though many other needed articles and machines are hard to find.

The kind that is most commonly found on Middle Tennessee farms is a double drum machine. The hay carrier rope is attached to the large drum which serves as a reel to bring in the load of hay from the wagon to any point on the hay mow. The drum motion is controlled by a lever operating a cone-clutch. Forward movement of the lever starts the drum turning and it stops as the lever is released. The second drum is a smaller one which serves as a reel to return the fork and carrier to the wagon. If the carrier travels 35 feet or more, much hard work and time will be saved on the pull-back. A retarder spring on the return drum prevents it from spinning faster than the rope is drawn off by the travel of the hay car. A brake is also provided to permit the operator to stop either the fork or the carrier at any desired point. Single drum hoists are also on the market but with such a machine the pull-back is done by hand just as in a horse-drawn installation.

The motor for operating the hoist may be anything from one horse power up. One horse power is a little slow requiring more time to remove a load from the wagon to the mow. A three h. p. motor is about right where the motor is to be used for hoisting alone. The correct speed can be obtained by using a 24 inch flat pulley on the hoist and a four inch three groove, V pulley on the motor. Five horsepower or anything at hand up will work fine and get the hay in faster too.

Few Pulleys Best

The hay hoist can be located in any convenient place as long as the main rope from the nearest pulley is in direct line with the center of the barn. It must be well anchored to take the hoisting load. It should be kept in mind that the fewer the pulleys, the easier the pull.

The most popular type of installation in Middle Tennessee is the one with the hoist location in the front of the barn. The equipment is mounted on a platform, 5 feet by 5 feet. The platform is raised on posts or on brace work, to the front barn wall. The hoist on the platform is usually 10 to 15 feet above the barn floor at a point to either side of the hay intake opening, where the operator can see both the load on the ground outside and the mow on the inside. Hay can easily be piled in under the platform.

This installation is generally in barns where a hay drier is used and hay is being brought in from the field frequently. A number of hoists have been installed like this on Davidson County farms this spring. One has been fixed where the man on the wagon who sticks the fork can operate the hoist and never leave his wagon. Frequently, however, there is some elderly man or young boy about who will take delight in serving as operator.

By reversing the fork only, the same machinery can be used to take hay from the barn to the outside for bailing. The hay can be let down directly onto the baler platform.

Bill of Rights Works Both Ways

In April Congress passed the Lea Bill which provides fine and imprisonment for any union which compels broadcasters to hire more employes than are needed "to perform actual service." In calling a strike at a Chicago radio station because the station refused to employ three additional librarians, James G. Petrillo, President of the American Federation of Musicians said the union appreciates that its action is contrary to the restrictions of the Lea Bill, but that he and his union would resist this law "until we are told by the Supreme Court of the United States that the Bill of Rights and the abolition of slavery do not apply to American musicians."

There is comedy in that statement. Just where does the Bill of Rights give any man authority to tell another man to hire three people he doesn't need, or to tell men working for another man to stop working, or where does it provide that before a man can work he must join some organization and pay monthly dues for the privilege of working? The Bill of Rights would permit a man to join any organization he desired and by the same token it would respect his right not to join. It is supposed to work both ways.

The Bill of Rights came into being to help guarantee freedom. When a man is forced to join and pay any specified organization, regardless of his desire to do so, before he can earn a living, he is not a free man.

Save the Grain

A number of years ago the food chain stores staged "producer—consumer" campaigns to move surplus crops. At that time there was a surplus of nearly everything. The chain retailers' campaigns to move these surpluses were in reality drives to teach consumers to eat a greater variety of foods, and more of them. The efforts were a spectacular success.

A gigantic producer—consumer campaign is now being inaugurated to help indirectly with Europe's famine. This country is raising a record crop of early white potatoes—60 per cent above last year, with nearly all areas from California to the Carolinas ready to harvest. Also, onions are coming on the market in abundance, as well as a wide variety of vegetables and fruit. With old-fashioned enthusiasm and typical promotional efficiency, the food chains have swung into the job of helping move the record potato crop onto the consumer's dining table as an alternate for bread. Other crops will be included in the program.

If past experience is any criterion, the organized assistance of the mass food distributors in the present emergency will prove effective. Thousands of stores in every section of the country will make it their business to shove the sales of abundant food items with every resource at their command. This will automatically ease demand for grain products essential to European relief.

The program of the organized food retailers is in accordance with recommendations of the President's Famine Emergency Committee, the Production and Marketing Administration, and other government agencies. It differs from any previous promotional effort in one all-important respect—lives depend upon its success. If the public will keep this point in mind, the efficient use of American abundance will be assured.

Production Waits On Whims

For months members of the petroleum industry have been calling attention to the fact that the petroleum supply is adequate to meet all demands. Acting upon the claims of OPA thPat as soon as a commodity was in sufficient supply, price controls would be removed, they long ago recommended that the oil industry be "decontrolled." Price control over oil has not been removed.

This is a sample of OPA "flexibility" and responsiveness" to changing conditions. It is a sample of why production is so far behind demand. No industry can operate efficiently when it must wait indefinitely the pleasure of public officials on questions that can make or break a business.

The most dangerous thing about the OPA is its obvious reluctance to part with its power. In the case of oil, the need for control ended with the termination of the war. The result of continuance has been increasing confusion. As one oil man pointed out, "under fixed price ceilings the tendency is to manufacture those products which produce the most profit. This has resulted in industry-wide overproduction of certain products and a weakening in their market prices; whereas other products, which normally would have been produced in greater volume to balance demand, continue to sell at unprofitable prices set by the government."

Congress should not be criticized for moving with caution in renewing price control.

Simple Truths About a Great Country

When our government takes over any of the country's basic industries, such as coal or railroads, millions of persons should realize something is happening wholly foreign to American political ideals.

Representative Boren of Oklahoma recalled these political ideals when he said:

"The cardinal principle of the American way of life is the recognition of the importance of the individual count in the American system.

"All the rights in the Bill of Rights are individual rights. Every individual is guaranteed the protection of his life and his property, his freedom. The guarantee of trial by jury is a guarantee to every individual.

"Our generation has forgotten that the system of private property is the most important guaranty of freedom. It is only because the control of the means of production is divided among many people acting independently that we as individuals have any freedom as to what we do ourselves. Whenever all the means of production are vested in a single hand, whether it be nominally that of a group of 'society' as a whole, or as a dictator—whoever exercises this control has complete power over us. In the hands of private individuals, economic power can be an instrument of coercion, but can never control the whole life of a person, but when economic power is collectivized into an instrument of political power, it creates a degree of dependency scarcely distinguishable from slavery."

If as a people we cannot understand such simple truths, we no longer deserve to be free.

A Lesson in Distribution

The sale of surplus war property is a sad lesson in distribution that the nation will long remember. Politics, mismanagement, cumbersome rules and general confusion have nearly blocked the sale of billions of dollars' worth of material which the country desperately needs. Everything from blankets to tractors is rotting away in supply dumps, in spite of the fact that everyone wants it moved quickly, including the officials in charge of the surplus disposal program.

The lesson is that an efficient retail distribution system cannot be set up overnight. Moreover, it cannot be set up at all if it is burdened with red tape. The government could probably learn a few things from the retail distribution industry. This industry has been working for years to develop the most efficient methods of moving from producer to consumer. Of course, unlike the government, private distributors are compelled to seek efficiency or sacrifice a slim margin of profit. Some of the larger chains have developed distribution to such a fine art that they are able to operate on profit margins of less than one percent of sales. They do it because they have learned to handle mountainous volumes of goods with a minimum of waste motion. And they try to have what consumers want at the right place and at the right time.

The job of distributors is doubly difficult at the present time, partly because they must fight an uphill battle to convince government regulators such as the OPA that excessive red tape and unnecessary rules are anathema to efficient distribution, a fact that has nearly wrecked the government's distribution of surplus property.

Junior: The drum you gave me was the best present I ever got.

Uncle: I'm glad to hear that.

Junior: Yes, Mother gives me a quarter a week not to play it.

Beef Cattle Raisers to Rely Upon Pasture

Because of grain shortage, Tennessee beef cattle raisers will have to depend more heavily upon pasture and roughage for finishing cattle for market this year, W. P. Tyrrell, assistant Extension Livestock specialist, University of Tennessee, said today.

Experiments conducted at the Middle Tennessee agricultural experiment station show there was little difference in finish between gross fed, and grain and grass fed calves in test lots. The tests were made by H. R. Duncan and others of the experiment station staff. Both groups of salves in the experiments were started on grass about the first of April after wintering on identical rations of cottonseed meal, sorghum silage and alfalfa hay.

During the 1942-43 feeding period, heifers on grass alone carried 64 days longer; weightd as much and sold for practically the same as those on pasture and grain. During the 1943-44 feeding period it was found that financial gains were in favor of heifers fed grain while on pasture. Final finish condition was about the same for both lots during the two years. The 1944 4 grain and grass fed salves sold for $2 more per hundredweight, and averaged $5.77 more profit per animal than those on grass alone.

Either plan of feeding seems satisfactory under Tennessee conditions, Tyrrell said. Earlier finishing practices have proved more profitable and seem advisable on farms where home grown grain is available and pasture limited. Succulent pasture during the hot, dry months of July and August have been found especially essential for heifers fattened on grass alone. However, cattle feeders who are following the "grass alone" method of feeding are advised to follow the late summer market closely, and avoid the market break which usually occurs in the last half of September or early October.

Sadder but Wiser

The railroad unions now know what government ownership means to striking unions. It means being in the uncomfortable position of striking against one hundred and forty million people; it means defying the representative of these people—the President of the United States; it means the end of negotiating and compromise—in short, oblivion for the union.

In fact, the whole case against government ownership of any industry became apparent in the railroad strike. As long as an industry is privately owned, controversies between management and labor remain merely disputes between groups of private citizens that can meet each other as equals at the conference table. Government then is a third party, an umpire and arbiter. Its only interest should be fair play all around. But once government operation materializes, private industry disappears from the scene, tension mounts, and the striking group finds itself cast in the role of a public enemy. There is no one to speak for it—thus it was with the railroad unions. When the government took over the rails and officially condemned the strike, that ended the matter. When the unions tried to defend themselves there was no one to listen to them or sympathize with them. They could go back to work or suffer the consequences—they went back to work.

Before the railroad strike, the head of one of the unions, Mr. Whitney, observed that government ownership was greatly to be desired in the railroad industry. It would be interesting to know how he feels about it now. Regardless of how he feels, he has rendered the country a very great service. He furnished an object lesson in socialism that should chill the heart of every American who is sponsoring it in any form.

7,000 West Indies

(Continued From Page 1)

Alabama State Extension Service.

The 60 farmers are selling their milk to an evaporated milk plant. From January through March they sold 153,100 pounds of milk and grossed $5,195.40 of which $1,061.70 was in subsidy payments from the U. S. Department of Agriculture. It averaged out to about $32 per month each for the farmers. Most of the farmers have three or four cows. These farmers say they like the idea of having money all year-round instead of just in the fall at cotton ginning time.

FSB OFFICIAL HEADQUARTERED IN LITTLE ROCK, ARK.

James P. Davis, administrative officer of the Field Service Branch of the U. S. Department of Agriculture, has established headquarters at 802 West 9th Street, Little Rock, Ark., according to announcement made by his office this week. Mr. Davis travels throughout the South conferring with farmers, farm leaders and rural ministers on agricultural problems.

FOOD PROSPECTS

More food will be produced throughout the world this year than last, but the level of production will be less than during the prewar period, the Office of Foreign Agricultural Relations of the U. S. Department of Agriculture reports.

In Europe, a considerable increase in grain and sugar is expected in 1946-47. A slight increase is expected in fats and oils, but little or no change in the production of other foodstuffs. Extraordinary social changes, shifts in population, and the shortage of draft power continue to restrict production.

In the Far East, increased acreage of food crops is expected, but the increase may still leave production far below the prewar level. Early spring rains in eastern India are enabling the farmers there to get their crops in early and under favorable conditions. Conditions for the spring wheat crop of China also are favorable.

Plan Now

To sow a few acres of alfalfa this fall, especially if you are a milk producer.

To stay with that garden and produce enough vegetables for home use this summer. Even though you have heard that there is a surplus of potatoes and cabbage the price has not noticeably changed on the retail markets.

To continue to pay off the farm debt as rapidly as possible and to think twice before making additional debts.

To save all the black berries on your farm. If you have more than you can care for let someone else pick them. If you are in need of berries get the farmers' permission before taking his.

To buy loaf bread only for emergencies.

To have a summer and fall garden equally as good as your spring garden.

To save all the potatoes you grow. Even though new potatoes are not selling at a very desirable price, chances are they will be much higher before another crop can be grown.

To attend the Junior Riding Club horse show at the State Fair Grounds on the nights of June 27, 28 and 29. All profits of the show will be used to build a district 4-H Club camp at Columbia.

To measure your tobacco field and grow only your allotment.

To have soil tested for fall crops.

More Sows Reported Farrowed in State

State agricultural statisticians said yesterday that nine per cent more sows were farrowed in the six months ended June 1, than in the same period of 1945.

However, their report said, the 133,000 sows farrowed still is 11 per cent below the 10-year average of 149,000 sows. Approximately 838,000 pigs were saved compared with 781,000 in the spring of 1945 and the 10-year average of 914,000.

The report, based on a poll of farmers in the state, said that some 127,000 sows were expected to farrow next fall or about two per cent less than in the fall of 1945 and five per cent below the 10-year average.

However, it added, "the indicated decrease for Tennessee is much less than the expected reduction of 16 per cent for the United States as a whole."

What Think Ye of

(Continued from page 1)

that He would say, find the weak, and make it strong. We should have our thoughts about all things, but thinking about Christ lifts me to higher heights. Think Roosevelt, and you see a government. Thing Einstein, and you see many scientific discoveries, Think of H. G. Wells, and you recall history. Think of Hitler, and your mind is on war; but if you think about Christ, your mind is set on hope, faith, joy, peace, and eternal and complete bliss. Be fair to yourself, take your mind off other things for awhile, and think about Christ.

A midwest oil company plans direct company operation of as many as 100 service stations in 15 states as part of a long-range program to train veterans for superior station operation.

A barge terminal with storage capacity of more than 3,200,000 gallons of petroleum products is under construction near Charleston, W. Va.

She: Enthusiasm is contagious.

He: Not always. I've courted girls who didn't seem to share my enthusiasm in the least.

WHAT IS YOUR PRICE?

By Ruth Taylor

What is your price?

Ask that of any man, and the chances are you'll get an indignant answer "I don't wear a price tag. I'm not for sale."

But, unfortunately too many people have a price of some sort. They wouldn't take a money bribe—fewer people do than is realized. However, they do ask favors, and return them. They don't speak out when they should, for fear of offending someone of importance to them. They don't want to "hurt people's feelings," by telling a bold and unpleasant truth. They are willing to compromise with issues in order to gain a point. They are warped by prejudices and swayed by their likes and dislikes.

The man **without** a price, the incorruptible man, is a man **above** price. He has an anchor in his principles. He is not moved by fear or favor. He stands on truth as he sees it, and he is strong in the hour of crisis. He is dependable in both small and large things. His word is good because it is never given carelessly.

The incorruptible man is not afraid. He will speak out against evil wherever it exists. But he will not condemn his fellow men without due cause—and then never misjudge a group by the action or opinions of one man. He holds no unreasoning prejudice. He treats his fellow men as individuals and respects their beliefs as he demands respect for his own. The only aristocracy he recognizes is the aristocracy of character, of good thoughts, of good manners. He neither looks down at or up to his neighbor. He is tolerant of everything except intolerance.

Given a nation of incorruptible men and the world could be a world at peace. The world will always follow the strong man, and the incorruptible man has an inner strength that is never more apparent than in the hour of adversity. He is like the city founded upon a rock. The incorruptible man is the honor, and the base, of a good community or a great nation.

What is **your** price?

The Cost of Cheap Power

Seldom has such a painstaking analysis of public versus private electric power rates been made available to the public as that recently released by J. J. Deuel, Director of the Public Utilities Department of the California Farm Bureau Federation. Mr. Deuel based the analysis on claims of the Bureau of Reclamation and the Interior Department of the Federal government to the effect that Federal power projects could supply power to farmers cheaper than the private power companies now serving the area.. He found that supposed statements of fact of these public agencies were nothing more than misleading propaganda; promises of " "cheap" power, upon closer investigation, evaporated in a maze of qualifications; rates were based upon assumed consumption levels twice the actual figures; farmers would be called upon to supply their own transformers and equipment now supplied by the power company, ranging in cost from $400 to $2,000; some of the lush promises were in direct conflict with the reclamation law; statements as to the present rates paid by farmers were highly exaggerated; finally, the cost of the Federal undertakings would be amortized without interest—in violation of the Federal code. The upshot of the analysis was that many California farmers would have to pay more for taxexempt Federal electric power than they now pay to the heavily-taxed private electric companies.

Mr. Deuel accompanied the analysis with a straight statement of local Farm Bureau policy, which says in part: "We are frequently accused of representing the power companies------We are also accused of being opposed to public ownership. We again deny that allegation. We have supported the organization of irrigation districts and other cooperative movements ever since the inception of the Farm Bureau, where they are organized and operated by the interested parties who own the land, use their services and pay the bill.

Where the Profits Go

The favorite pasttime of some of today's self-styled liberals is to tear the hide off corporation profits. Where do these profits go that these liberals so enjoy castigating?

Consider one of the leading corporations, an oil company. This company earned a net profit of nearly $9,000,000 in 1945—a lot of money. But as the company points out, this profit, like tax revenue, is divided among a lot of people The company is owned by about 35,000 individual Americans, enough to make a city the size of Santa Barbara, California. They live in many sections of the country. They own an average of 137 shares of stock a piece. No one holds more than 1 1-4 per cent of the total shares outstanding. The $9,000,000 divided among these 35,000 people averages about $250 per person. However, this company, consisting of 154 million dollars' worth of oil wells, refineries, service stations, etc., set aside $4,000,000 for the business. Dividends paid out—money that actually went to the owners—averaged just $137.49 per stockholder—$11.46 per month Wages paid out averaged $3,283 per employe, or $274 per month.

No matter how the critics of profit paint the picture, they cannot conceal the fact that American industry does not represent the investment of a few millionaires, but the combined savings of thousands of citizens. Neither can they conceal the fact that without some such method of financing heavy industry, American mass production, the envy of the entire world could never have been accomplished.

We are unalterably opposed to that type of public ownership operated by bureaucrats by remote control from Washington-------- We fear some farmers do not realize the benefits which they receive from the diversified load of power companies----and we know what their great disappointment will be if some day they find themselves securing service from a rural power district which has no other type of load except agricultural power, service."

State Firm to Ship 75,000 Horses, Cows To Europe

Memphis, Tenn., July 6—(AP)—A Memphis firm will ship approximately 75,000 horses and cows to Europe this year under the UNRAA program.

Owen Brothers Horse and Mule Commission Company, which boasts the world's largest mule business, announced it had received a contract to start shipment as soon as possible by way of Savannah, Ga.

The company said the first shipment would be made as soon as necessary stockyards could be built in the Atlantic Coast city—"in three or four weeks."

Stockyards capable of handling 5,000 head at one time will be built in Savannah.

H. H. Small, office manager, said as many as 15 shiploads of 800 horses and cows each probably might be dispatched weekly.

While Owen Brothers handles around 50,000 mules annually, Small said he understood mules were not included in the contract awarded by the U. S. Department of Agriculture. The ratio, he asserted, will be four or five horses to each cow.

A sign in front of a shoe repair shop pictured several styles of rubber heels and a beautiful girl who was saying, "I'm in love with America's Number 1 heel." Underneath, in small feminine handwriting someone had added, "Too bad, sister! I married him."

Sign in front of a gas station: FOUND—Something. Either a hat or a bird. Blew in or flew in. Owner may claim same by identifying it.

Hope Reborn

The United States is destined to eat less in the near future, in order that other countries may have a little more food. Far from hurting the health of the nation, medical spokesmen say it will do us good. In fact, the health magazine Hygeia, a publication of the medical profession and a recognized authority in its field, declares that "this cannot possibly harm the average American citizen. Indeed it is likely to help him, since overweight after middle life is recognized as one of the important causes of abbreviated longevity." It then gives some practical suggestions for diminishing the consumption of wheat and fats, such as one-piece sandwiches, buckwheat cakes for breakfast, the substitution of fruits and other desserts for pastries and cakes, broiled instead of fried meat, and bread and jam without butter.

The wholehearted manner in which our people have expressed a desire to share food with other nations, is encouraging. It is the mark of a reviving civilization.

"How," writes a distracted parent to this office, "Can I convince my daughter that the young man she goes with is worthless?" Have her marry him.—Atchison Globe.

Poultrymen Told to Sell Non-Productive Birds

Following the steps taken recently to encourage movement of grain for shipment abroad, U. S. Department of Agriculture poultry officials are urging the nation's poultrymen to sell non-productive birds to reduce producing costs of both eggs and meat chickens.

The higher ceiling prices placed in effect on corn, wheat, and other grains and proteins to make more available for direct human consumption do not permit feeding "boarders" in the average farm poultry flock, officials point out.

Milking Machine Saves Time, Labor; Returns Cash Profits

By Kenneth B. McPherson

While there may be some people who really enjoy milking by hand, most farmers and dairymen who have had experience consider hand milking one of the most difficult and time consuming jobs connected with dairying.

As labor-saving machinery has been introduced into factories, the workers get better wages, largely because machines help them to produce much more and at lower cost than is possible by hand. In farming too, so far as mechanical power has been adopted, it has greatly increased the output per man and reduced production costs. There is still too much hand labor in farming, however, especially in the dairy business.

Suppose a man had 15 cows each giving milk ten months out of the year and dry the other two months. How do the value, the importance, and the labor of harvesting the milk crop compare with the importance, the value and the labor of harvesting other crops on the farm?

Good average cows in Middle Tennessee can be expected to produce 4,000 pounds of milk a year. From this little herd, that is 60,000 pounds or 30 tons of milk, the same weight as 1,000 bushels of wheat or potatoes. Certainly, the price of milk goes up and down but it is usually higher pound for pound than other farm products and will therefore justify as much investment.

Year in and year out the average man will harvest from 50 to 75 pounds of milk an hour by hand. On a spurt he can double that and when the cows are fresh he might be able to treble it. But 15 cows twice a day for 300 days each means 9,000 milkings to do. It would take seven miles of staunchions to hold that many cows and 120 ten hour days, four solid months, to milk them.

In this day and age no one would think of going out to cut 30 tons of hay with a scyth, or to rake it up with a hand rake. Some men would hesitate to pitch that much hay onto a wagon and more shun pitching it by hand up into the hay mow or on to a stack.

Who would cradle a field of wheat yielding 1,000 bushels, or bind it by hand, or thresh it with a flail? For that matter, who would even dig 1,000 bushels of potatoes with a fork even though he could roll out many times 75 pounds an hour.

Machines have lowered the cost of producing and harvesting all these crops, and milking machines offer a fine opportunity to increase profits by reducing cost in the dairy business.

The milking machine is also a factor in producing clean milk. The milk is drawn into a closed container and has less possibility of contamination than by hand milking even though a small top pail is used. Bacteria, of course, are always present and it is almost impossible to have absolutely sterile utensils. A milking machine may increase the bacteria count materially if the machine is not properly cleaned and stored. Too much importance can not be placed upon the proper cleaning and storage of the milking machine parts that come in contact with the milk. The task of cleaning is not a difficult one, but should be practiced regularly and religiously according to the instructions of the manufacturer for his particular type of machine.

The milking machine has proved its worth as a time and labor saver on many farms. If properly cared for it will help materially in producing clean milk with low bacteria count. If operated intelligently it will not only relieve the labor problem and arm aches of hand milking, but will pay for itself and return cash profits in a reasonably short time.

Don't Eat Seed Beans Health Director Warns

Knoxville, June 15 (AP)—Knoxvillians were warned today by City Health Director W. H. Enneis not to eat seed beans, after a physician reported a 14-year-old school boy died from eating chemically-treated seed beans.

The physician in the case said all indications point to death by poisonous beans which had been treated chemically to kill off bugs and parasites," Dr. Enneis said in issuing the warning.

"Some seed beans are treated and others are not, but a safe rule is: 'Don't eat seed beans'"

Farm Outlook Appears Bright Through 1947

Washington, July 6 — (AP) — Farm prosperity, which rolled to a historic peak during the war years, "should continue at least until well into 1948," the Commerce Department said today.

But after that, it cautioned, "there is no assurance that the old farm problem—lack of adequate markets and hidden farm unemployment—may not again appear."

During the war, the department said, the nation's farmers enjoyed a 200 per cent increase in net income and piled up a $10,000,000,000 backing of savings in cash and government bonds.

From 1940 through 1945, the farm population decreased by 5,000,000 persons to a total of 25,000,000, or 18 per cent of the nation's population, but the net income from farming rose from $5,600,000,000, to $14,800,000,000, the department said.

Now, it said, farm land prices have gone 69 per cent above 1939 but "there is as yet no evidence of any extensive back-to-the-farm movement" even on the part of veterans who were drafted away from farm areas.

The farm market now is larger than ever, but the part it plays in bolstering the postwar economy will depend in part on whether savings go into purchase of goods or into speculation in farm land, the department said.

Three factors were rated important in the department's view of the farming outlook.

1. "The best insurance of continued farm prosperity lies in an adequate number of jobs in business and industry for the excess farm population and continued business prosperity with a high level of wages so that people can continue to buy farm products."

2. Fifty per cent of the nation's farm produce nine-tenths of farm output, and many farms furnish "only a meager subsistence and very little cash income to their operators."

3. The birthrate on farms exceeds that in cities and, coupled with the trend towards increased mechanization and larger farms, "means increasing numbers of farm people will be seeking industrial employment."

The Nnited States consumes in the neighborhood of 4,200,000 gallons of lubrication oils daily.

Tests Scheduled For Cows Entered In State Sales

Michigan State Holstein-Friesian Association, at its annual meeting, voted to test each cow entered in the state sale in milk at the time of the sale for mastitis after the cattle are assembled in the sale barn.

This procedure was followed by the Tennessee Jersey Cattle Club at its anual sale last month and is believed to be the first time any association ever adopted this practice. The Michigan association is also following the Tennessee group in that they are testing each animal for Bangs before it is allowed to be sold in a state sale.

Tennessee for the past several years has required that each animal sold in state sales or entered in state shows be tested for Bangs. No Bangs reactors or even suspects are allowed in the shows and sales.

TOMATOES POPULAR VEGETABLE

The tomato has a clear claim to first honors as the most popular vegetable, according to results of the sample survey of 1945 victory garden by the USDA Bureau of Agricultural Economics. With need for garden production even more important this year than last, the department anticipates that the tomato will hold its lead this season.

In 1945 victory gardens, the survey showed that the tomato was grown in 88 per cent of the farm gardens, and 90 per cent of nonfarm gardens. On farms, this compared with 85 per cent that included onions, 84 per cent string or wax beans. 75 per cent lettuce, and 72 per cent radishes. Potatoes with 75 per cent and both green peas and cabbage in 70 per cent of the farm gardens were the other crops grown by 70 per cent or more of the farm gardeners.

Threats Will Not Help

When the West Coast developed an incipient smallpox epidemic, health authorities and the medical profession moved with astonishing efficiency. Vaccination of hundreds of thousands of persons and prompt isolation of known cases soon put a stop to spread of the disease.

Alertness to this kind on the part of medical authorities is so thoroughly taken for granted that not a word of commendation for the doctors was discernable. Rather, at the very moment that this age-old scourge appeared and nothing prevented it from sweeping the entire population except prompt action from the medical profession, there were a number of senators down in Washington scoring the medical profession as selfish and behind the times because it opposes Federal domination of medicine.

This lack of appreciation for the benefits brought to all the people by science and the medical profession, is amazing. Naturally, there is room for improvement, and improvement is coming along coninuously in standards and extent of care. But one thing is certain: The manner in which political pressure has put a time clock on the physician's desk, with the plain implication that he must produce the perfect medical system by five o'clock tomorrow morning or submit to government dictation, is going to help no one.

Roadside, Curb Markets Help Sell Farm Produce

Marketing of surplus farm products direct from the farm to the homemaker is one source of cash income which should not be overlooked by farm families, Miss Isadora Williams, marketing economist with the Agricultural Extension Service. University of Tennessee, said this week.

Produce can be moved from the farm directly to the table through roadside market, special day markets, and curb markets, Miss Williams remarked, pointing out that such media have added more than three-quarters of a million dollars to incomes of Tennessee farm families in recent years.

Conservation Pays Dividends In Lawrence

Lawrenceburg, Tenn., June 29—(Special)—In Lawrence County 1,988 farmers earned $167,017 in 1945 through soil conservation practice carried out on 118,000 acres of crop land, according to C. T. McAnally, chairman of the Lawrence County ACA committee.

The principal practice carried out to earn the $167,017 were: Lime, 19,512 tons; superphosphate, 412 tons; basic slag, 177 tons; potash, 99 tons; terracing, 91,400 feet, and seeding of winter cover crops 19,903 acres.

Under the 1945 Dairy Feed Production Program, farmers in the county were paid $67,307. Under the Beef, Sheep and Lamb Production Program farmers received $527 in 1945.

Fifty-five cotton producers had Federal Crop Insurance on their 1945 cotton crop—a total of $575 was paid in indemity to 12 producers who had losses. This year 143 cotton producers and 96 wheat producers have insurance.

This year's agricultural conservation program for Lawrence County is again aimed at assisting farmers in carrying out conservation practices that will rebuild and conserve the soil. In doing this the local Agricultural Conservation Association has been allotted $132,221.

The practices included in the 1946 program for Lawrence County are liming, phosphate, potash, pasture development, terracing and winter cover crops. These practices were determined by the combined recommendations of community and county AAA committees and representatives of other agricultural agencies.

Where Will It End?

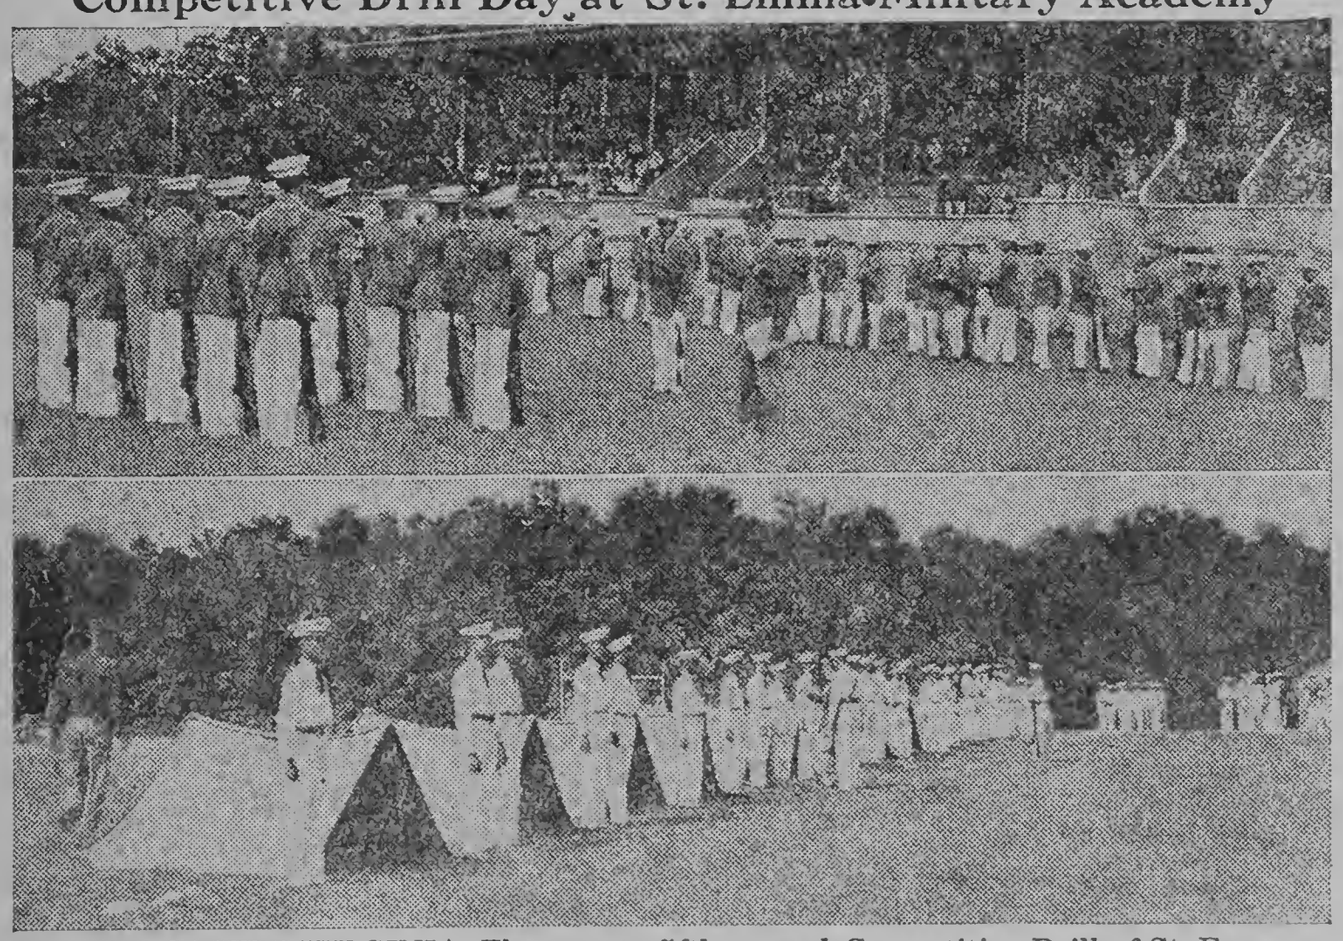
Demands for health and welfare funds will appear more and more in union controversies with management. Even if the principle of the private tax now involved in the coal strike is outlawed, the problem will remain. Social security, which is supposed to be at least a partial answer to such contingencies, is seldom mentioned because inflation is tending to dwarf the value of the present social security program. Inevitably, sentiment will arise for increased social security benefits. This will mean in all likelihood more public debt and still more inflation. And so the crazy circle goes, with the living standards of the great mass of American citizens falling steadily lower.

On top of it all comes the proposal to spend billions of public money on a nationwide state medical system. With socialized medicine tacked onto social security, the overall program may ultimately cost the working people of America 25 percent of their income. Such is the estimate of qualified authorities. This is exclusive of taxes to support a peacetime Federal government that spends several times as much as in prewar years.

Where will it end? We should begin asking ourselves this question. England, whose people are burdened with a near bankrupt government, is in the process of conversion to state medicine. The cost of the scheme in the early years is estimated at more than $600,000,000. Some of England's financial difficulties may be eased by a loan from America. But what about America? Who is going to bail us out when we get into trouble?

It begins to look as if the proposed obligations of our Federal government will require near confiscatory taxation on the earnings of everyone, confiscatory taxation means the end of liberty—a high price to pay for even the most desirable social reforms.

Competitive Drill Day at St. Emma Military Academy



ROCK CASTLE, VIRGINIA. The twenty-fifth annual Competitive Drill of St. Emma Military Academy Cadets produced many spirited events in an all-day contest to determine the winners among the companies and individuals of the Junior Reserve Officers Training Corps at this boarding high school. The upper picture shows the elimination drill among cadet privates. The lower photograph shows the shelter tent contest. In the grandstand are relatives and friends, many of whom travelled long distances from their homes throughout the entire Eastern United States. The students from nearby St. Francis de Sales Academy for young ladies also were guests.

Neglect of Leaky Water Faucets Is Costly and Wasteful Practice

By Kenneth B. McPherson

It is an easy matter to neglect a leaky faucet. Most of us are inclined to let the drips continue to drop until it exactly suits our convenience to repair it. This is usually a costly and wasteful practice, especially if it is the hot water faucet.

In that case, not only is the pumping energy wasted but cosiderable heating energy as well. If steel pipe is used for the supply plumbing, the rust in the water is also likely to stain the enamel on the fixtures, a damage in addition to the surprisingly large volume of water wasted.

The Agricultural Engineering Department at Cornel University has made some studies on water losses from leaky faucets and also the kilowatt hours of electricitly required to heat water lost through a dripping hot water faucet. It found the following to be true:

Faucet leaking 30 drops per minute, 54 gallons per month lost; faucet leaking 60 drops per minute, 113 gallons per month lost; faucet leaking 120 drops per minute, 237 gallons per month lost; faucet leaking ½" solid stream before forming drop, 1105 gallons per month, and faucet leaking 1½" solid stream before forming drop, 2202 gallons per month lost.

In the case of a hot water faucet there may be, in addition to water losses, quite a heat loss too. With the ordinary household water heater set to heat water at 140 degrees Fahrenheit, an average of one kilowatt hour of electricitly is consumed for every three and one-half to four gallons of water heated. At one kilowatt hour for every four gallons, the energy to heat the water wasted at the rates shown above would be:

Faucet leaking 30 drops per minute, 13.5 Kwhrs. per month; faucet leaking 60 drops per minute, 28.2 Kwhrs, per month; and faucets 120 drops per minute. 59.2 Kwhrs. per month; faucet leaking ½" solid stream before forming drop, 250.5 Kwhrs, per month; and facuets leaking 1½" solid stream before forming drop, 550.5 Kwhrs. per month.

New washers for faucets are cheap. New faucets themselves sell for as little as a dollar each. It is obvious that a little time and money spent repairing faucets yields good returns.

The job of repairing leaky faucets is a very simple one that can be done by any man or woman. Generally, the only tools needed are a small pipe wrench and a screw driver.

First examine the faucet in order to see where the leak is. If water is being lost at the spout, the trouble is due either to a damaged washer or to a damaged seat or to both. The stem packing may be defective if water is leaking at the stem when the water is turned on.

After determining the cause of the leak, turn the water off. Then take the faucet completely apart and repair or replace the worn part. To protect the finish on the faucet, use a heavy cloth on the jaws of the wrench. If the leak is caused by a defective or worn washer it should be replaced with a new one. If possible a composition washer made of asbestos and rubber should be used on the hot water faucets. A pure rubber washer will soon be destroyed by heat.

If the screw which holds the washer is rusted to such an extent that it can't be backed out without breaking, it should be drilled out and replaced with a new one.

This type of repair work should not be neglected. It must be done sooner or later. Delay in this case costs money.

Little Emily, age five, kept watching very intently a man eating corn on the cob at the next table in the restaurant. Finally she looked up with wondering eyes. "Mamma," she said, "why is it that no music comes out?"

Square Milk Bottles Are New Improvement

It was exactly 50 years ago when the first glass milk bottle was used and Dr. H. D. Thatcher, New York, is credited with being the inventor.

He had considerable difficulty in convincing the public that the glass bottle was the thing to use. The first bottles, unlike our present ones, did not have a cap-seat but were covered by a medal cap with a spring attached. A number of improvements have been made in the style of the milk bottle through the years.

The most drastic change was noticed recently when the dairy plants started using the square type bottle. The new bottle is supposed to take up one-fourth less refrigeration space than the round type.

Some Unsaid Things

"Continuing its program of boasting about the economic advantages the Tennessee Valley Authority has created at the expense of the taxpayers of the entire country," says the Wheeling, W. Va., Intelligencer, "the Tennessee Department of Conservation is currently printing an advertisement in national publications which says among other things:

"Power lines have brought to the area a new way of life. Farms have become mechanized____Motors have taken the place of man power. Modern appliances have made living more enjoyable. Workers have more time for self-development and recreation_____'

"The advertisement doesn't say how many farms have become mechanized, or to what extent motors have replaced men. Actually, after 10 years of TVA, directed primarily at electrifying a vast rural area, only 25.6 percent of the farms in Tennessee are electrified. In that respect, Tennessee ranks 41st among the 48 states of the Union.

"West Virginia, getting power through private enterprise and without Federal subsidization of nearly a billion dollars, has electrified 33.8 per cent of her farms. Tennessee has increased farm electrification 551.3 per cent in 10 yrs., West Virginia, 820 per cent.

"The advertisement leaves some other things unsaid. It mentions that flood control____has been accomplished. Assume for the sake of argument that the big dams have stopped the floods. But to do so, they have permanently flooded territory with an estimated crop value of $3,000,000 whereas the average flood damage was figured at $1,784,061.

"This propaganda is directed at private industry, inviting such industry to seize upon the opportunities awaiting in the Tennessee Valley by locating plants there. Ironical, to say the least, that such an invitation should come from a private enterprise.

"The advertisement offers no operation that is the antithesis of assurance that new industry locating in Tennessee will not be absorbed by the government like private companies in the power field have been."

Canning Supplies Easier to Obtain

With home canning as important as at any time during the war, housewives will find the task easier this year because of greater canning supplies, according to specialists at the Kentucky College of Agriculture and Home Economics.

There will be little difficulty in getting either a pressure canner or waterbath canner, as aluminum and enamelware are in good supply. Jars and tops are ample, and rubber rings are of better quality than during the war years. Glass jars will be plentiful, although tin for cans continues to be scarce.

Of the 634 locomotives placed in service on U. S. railroads last year. 534 were diesel.

A Ceiling On Red Tape

Regardless of whether the Emergency Price Control Act is renewed or abandoned, something must be done to put a ceiling on the red tape issuing from OPA. The variety trade which accounts for a tremendous volume of retail sales in the United States, must abide by thousands of confusing orders. Following is a summation of them as of March 1, 1946.

First of all, there is the General Maximum Price Regulation to which there have been 66 amendments. There are 15 supplementary regulations under the GMPR and 390 amendments thereto affecting goods and services sold through the variety trade. There is a Maximum Import Regulation and 9 amendments all of which are potentially of interest to the variety trade. There are 268 numbered price regulations with 2,506 amendments covering goods and services sold through the variety trade. There are 4 food product regulations that affect the thousands of variety stores that have soda fountains, luncheonettes and food departments, and these 4 food regulations now include 25 supplements with 97 amendments. There are 3 procedural regulations with 12 amendments which variety stores as well as other retailers and business concerns must observe. There are 36 supplementary orders with 131 amendments that directly cover goods and services sold through the variety trade. There are 3 general orders with 6 amendments. The total of the regulations, orders, amendments and interpretations is 3,576.

But in addition to these there have also been 11,848 individual orders of which half or more probably two-thirds, affect either the purchase costs or the selling prices, or both, of goods handled in variety stores.

Finally, the OPA has issued and is issuing a large number of individual orders that are not even printed in the Federal Register, known as letter orders. These orders authorize prices in individual cases of manufacturers, wholesalers and retailers. There have been hundreds, perhaps thousands, of them. The variety trade is concerned with every one of these letter orders that fixes a price for one of its members, its sources of supply or its competitors.

The variety trade which was affected by a mere 800 regulations, orders, amendments and interpretations back in April, 1944; was, March 1, 1946, affected by 3,576 general regulations, orders, amendments and interpretations. If one may include the individual orders listed in the Federal Register, not to mention the letter orders issued to individual concerns that are not even printed in the Federal Register, the present number of regulations, orders, amendments, and official interpretations that do concern the variety trade is in excess of 8,000, ten times the number reported in 1944.

Farm Land Prices Continue To Soar

Here's a report on the buying and selling of farms.

It shows that farm real estate values in most parts of the country continue to rise much the same way they did after World War I. What's more, it shows average values have already reached uncomfortably close to the peak they hit in the boom, just before the bust, after that other war

So many sales at higher prices are taking place, economists doubt that buyers are giving proper consideration to the long term earning capacity of the land. If so, many buyers may find they've paid too much for their land.

"Shall We Say Grace?"

Pork Rated High In Food Supplies Of Farm Families

"Farm families consume more pork than all other meat combined," Grady Sellards, of the Kentucky College of Agriculture and Home Economics, said today in a plea for the production of larger home food supplies. "Hence pork assumes a place of much importance in the family living. This is true because from the pig are obtained fresh meat, cuts for curing, for sausage and for lard for use in seasoning.

"Excellent cuts of pork can be obtained from finished hogs weighing around 200 pounds. On each farm one or more heavy hogs may well be produced for converting into lard and sausage. The practice of carrying shotes through the summer on limited feed and finishing them in the fall to excessive weights is not practicable, except for those animals to be used for lard production. The cuts from such animals are over-fat and do not make a good cured or canned product. Certainly, if this is the only kind of hogs available they should be used.

"In the production of hogs for home pork, full advantage should be taken of using waste or low-quality grains, pasturage, skim-milk and kitchen waste. But care should be taken to provide balanced rations, just as would be done in feeding for market."

The Easonian Seminary

Dr. James T. Mason, President

Summer Session for Teachers 30-Day period: Largely attended.

Birmingham, Ala.—Dr. James T. Mason believes in the teachers knowing what they are attempting to teach. He says guess work will not do If you don't know your lesson you can not teach it so don't attempt to fool yourself and the students too. So he insisted upon all the teachers who expected to teach attending the sessions of the Summer School.

Lady (at telegraph office): What will it cost to have my umbrella sent to me by telegraph?

Telegrapher: Why, madam, it can't be done.

Lady: Don't try any of your smartness on me, young man. If you can send flowers and money by wire, why can't you telegraph

Blackberry Prices Justify Harvesting

The 1946 crop of wild blackberries is again demanding a price that definitely justified its harvest On the local curb market the berries are selling for 35 to 40 cents per quart or wholesale at about $7 per crate. "I reckon people just like blackberries better than they used to" one man seen at the market remarked. "I have picked and delivered them for 10 cents per gallon, and I have seen the time when I couldn't sell them at all," he said.

With an unusual amount of rain the berry crop is good in most sections. County Agent H. W. Andrews of White County said that two to three refrigerator truck loads are being shipped from the Sparta area daily. "The farm people are receiving from 60 to 75 cents per gallon for their berries," Andrews said.

The frozen food plant at Portland started processing blackberries from Clay and Overton Counties this week. The plant is paying 15 cents per pound for the berries delivered at the plant. One six-gallon crate of good berries will weigh 36 to 37 pounds. The Portland plant processed a little more than 500,000 pounds last year and expects to almost double the amount this year.

Some farmers who own a large acreage of the wild berries are experiencing trouble in getting them picked while others are offering as much as 10 cents per quart to pickers.

Frozen food plant officials say the blackberries make a very desirable product for the home locker. If picked at the right time and properly cared for before being placed in the "quick freeze room," the fresh flavor will be retained to a greater extent than in most other fruits and berries.

On Guard!

A free press, most vital of the Nation's safeguards against oppression and exploitation of the people, cannot exist without free enterprise. Without private ownership and free enterprise, there would be no need for the thousands of newspapers and publications which this country now has. Fifteen or twenty official organs would suffice. This is overwhelmingly proven by the evidence of modern history.

Mowing Pastures Gives More Feed To Offset Shortage

Pastures are carrying an extra load this year because of feed shortages which makes extra attention to the pasture necessary for best results, agronomists of the UT Agricultural Extension Service have announced.

A favorable season has kept weeds as well as pasture plants growing and both need to be kept under control by mowing. Some of the pasture plants may have reached the heading-out stage becoming tough and unpalatable. Clipping will stimulate a fresh growth to provide grazing late in the season. Mowing also is needed in most pastures at this season to eliminate weeds, which take up a considerable amount of moisture.

Weeds and sprouts common in pastures now are bitter weed, iron weed, golden rod, yellow top, squaw weed, ox-eye daisy, dock, plantain, white top, butter cup, dog fennel, sumac. sassafaras and presimmon. All of these injure pastures by shading and crowding out grasses; but they also will rob the soil of moisture when it is needed most —in the hot, dry days of July and August.

The carrying capacity of many pastures can be increased from 25 to 50 per cent by mowing and clearing off the undergrowth. Two mowings each summer is an inexpensive way to have more grass.

Increased pasture production is extremely important now, agronomists say, as the end of feed problems is not in sight. Pasture improvement should include fertilization, where needed, by the use of lime and phosphate. The use of these materials has increased enormously in the past few years, but there is still room for their further use, it is pointed out.

VETERANS URGED TO FILE FARM TRAINING FORUMS

Murfreesboro, Tenn., June 29—(Special)—Rutherford County war veterans who wish to enroll in the farm training course now being offered through the Veterans Administration and local school authorities have been urged to file applications by July 12.

Myers Parsons, supervisor of the first group of 25 veterans already enrolled, said that the County Advisory Committees would meet July 12 to consider applications. This committee, composed of local agricultural teachers and representatives of a number of agricultural agencies and groups, must approve all veterans admitted to the training.

Under the program, veterans are taught to farm, while living on the farm, and receive the government subsistence payments of $65 a month ($90 if with dependants) just as though they were attending college or taking business job training.

Parsons said if there are enough applicants, another class will be immediately formed, and another supervisor obtained.

To receive the farm training, veterans must own a farm or have control of a farm by lease or other arrangement. The training can be continued for a year longer than the veteran spent in service up to a maximum of four years.

Community improvement is one thing in which you win if you don't get a prize.

IT'S ABOUT TIME to make a table for your terrace from a telephone cable spool. Try to find 2 or 3 of these to hold beach umbrellas which you stick into spool centers. Paint the spools to match your chairs.

Sarge: Now in case of emergency, the first thing to do is put on the brake.

Recruit: I thought that came with the truck.

The world's proved petroleum reserves total approximately 60 billion barrels, of which more than 20 billion barrels are in the United States.

Pay Or Walk

Based on figures presented to the Interstate Commerce Commission to substantiate their request for a 25 per cent rate increase, it is evident the nation's rail lines are justified in seeking relief from conditions entirely beyond their control.

The freight rate increase proposed would not produce as much additional revenue for the railroads as the increases in their expenses due to rising prices and rising wages since the beginning of the war. It is estimated that if the proposed increases could have been in effect for the entire year 1946, which obviously they could not, they would produce slightly less than $1,000,000,000 in additional revenues. Over against this there is the fact that increased wage levels, averaging nearly 48 per cent since the beginning of the war in Europe will cost the railroads $1,355,000,000 in 1946, while increased prices of materials and supplies which the railroads must buy will add an estimated $500,000,000 a year to their expenses, or a total of $1,855,000,000.

It is estimated that freight traffic this year will be 19 per cent below 1945 and 25 per cent less than 1944, and that passenger traffic will drop 29 per cent below 1945 and 32 per cent below 1944.

With abnormal war traffic the railroads met costs, paid $3,876,000,000 in Federal income taxes, and earned an average of 4.97 per cent on property investment after depreciation.

The government has a greater financial interest, through tax receipts, in the ability of railroads to earn a profit than have the owners of the railroads, because the rail lines pay more taxes than dividends. It is no longer a question of whether freight rates will have to be increased, it is merely a question of how soon, to prevent unnecessary loss to the government and railroads alike, and assure efficient railroad service to the nation.

What Does the Returned Soldier See?

For millions of Americans, this will be the first Independence Day they have spent at home in four years. As they attempt to resume a productive life in civilian society, the changes they face since their last "Fourth of July" are almost beyond believing.

A year ago the Army alone had some 10,000,000 men in uniform—now it is approaching 1,500,000. The country's resources were then devoted to pursuing the war against Japan. Most important of all, the majority of people, regardless of other differences, were working in close cooperation to attain the all important goal of victory in war.

Since the defeat of Japan, we have had a new and equally important job—production for peace, the reemployment of our people in pursuits that will contribute to the welfare of all, a fresh start after the economic ravages of war. That job requires the same devotion to purpose, the same massing of tools and skills, the same understanding of our problems, as did the job of achieving miitary victory which we performed so magnificently.

What does the returned soldier see on the first Independence Day at home in years?

He sees a country faced with shortages of food, housing, clothing and other necessities to an extent greater than at any time during the war.

He sees a country bedeviled by strikes, indefinite delays in production of vitality needed goods, loss of billions of hours of work, the savtge dislocation of the economy.

He sees a government which is vacillating in emergencies, which truckles to pressure groups, and which has refused to grapple decisively with the issues of the time.

He sees political controls on business, largely imposed by bureaus which usurped the functions of the courts, which make it impossible to start a new business or expand an existing one—controls which prevent employment and production.

He hears talk of ruinous inflation on the one hand and disastrous deflation on the other—possibilities which are the direct result of the failure of government and labor to measure up to the responsibilities now before them.

The soldier who came home with high hopes is finding those hopes impossible to realize. The soldier who read of the "sacrifice" of the people at home is becoming cynical and embittered. This 4th of July, like the first, was to have been for him the observance of a new birth of freedom, of opportunity, of human progress in a world at peace.

Actually the failures which the veteran sees are minor compared with the opportunities for development that remain in this country. The fact that these opportunities are temporarily strangled by pressure groups and politics and bureaucratic restrictions, is an invitation to the returned soldier to direct his energy to the job of reclaiming the United States as a land of opportunity where government is the servant and the individual is the master—the kind of a land that our first Fourth of July commemorated.

As a nation we have always been able to marshal our resources and fight for independence in an unselfish manner. It is possible for us to follow this same course to preserve a sound and prosperous nation in peacetime?

No political philosophy yet advanced can compare with the dream of our forefathers who asked only for a land dedicated to life, liberty and the pursuit of happiness, the dearest possession of every American citizen.

"If an electric train was going 30 miles an hour and the wind was blowing 40 miles an hour with the train, would the smoke go forward or backward?"

First Student: "The smoke would go straight up."

Second S.: "It would go forward."

Third S.: "It would go backward."

"You are all wrong, there would be no smoke from an electric train."

State of the Nation

Anyone who conducts a business successfully in the face of the growing mountain of government controls, must have a corps of lawyers at his elbow. An individual with a good idea and the willingness to risk his savings to back his idea, is kept by the grace of countless not enough. He cannot go ahead exbureaus and agencies staffed with hopelessly confused little bureaucrats. Every move he makes must be paved with prioroties, allocations, certifications, and directives. If he does manage to run to the gauntlet and come out with an article the public needs and wants, he cannot sell it unless the price is approved by a government agent acting under the authority of an unintelligible formula. In the meantime, the government continues to print tons of hopeful advice to aspiring small business.

Such is the state of the nation. Paradoxically, large industries able to hire lawyers, and survive the present crazy system if anyone can, are the most vociferous in their condemnation of the situation. They realize that they were once small and they want to preserve the kind of a country which keeps alive the hope of the beginner. They realize too that if a crop of healthy small business is not developing continually, big business and big government will gradually destroy opportunities and freedom for the individual.

As the president of one leading oil company asserts: "...Business and industry to succeed must serve the public. This is best done through competition. To have competition we must preserve at all costs an enviroment in which the little man can continue to challenge the big fellow for public favor.... Faith in competitive enterprise has guided my life. Within my lifetime the company founded by my father grew from a very small enterprise to one of substantial size."

We cannot restore individual opportunity in this country unless we reject government by decree, which is the kind of government we have now as far as business is concerned. and which is the kind we will have tomorrow for all of us if a resurgence of confidence in independent action does not appear soon.

Production—The Hope of Coal Miners

Even in the depths of the coal strike crisis the coal industry continued to lay plans for future development of the coal business. These plans will benefit the miners as much as they will the operators. They represent a serious attempt to offset the increasing disparity between wages and output per man shift in the mines. Actually they are the only hope for the future of the coal miner. Rising wages and rising prices can ruin any industry if they get out of line with competitors, and coal has reached its limit if it is to stay in the competitive fuel market.

Mine union leaders from this point on can either bring hardship and unemployment to their followers or they can encourage the use of coal by helping to hold costs down to manageable levels. This is not hot air. It is the disagreeable truth and any miner who wishes may look up the figures for himself They are a matter of public record.

There is the case history of the coal industry in England that was ruined beyond repair in the foreseeable future, at least in part, because wage problems and other demands of miners were not resolved in coordination with the needs of the industry. The result has been tragic. No one wants a repetition in this country.

Increased production is the only sure path to sustained wage increases. But it takes more than mechanization to increase production—it takes rising consumer demand, stimulated by a fair price for coal. This is a fact of life that every miner will have to learn.

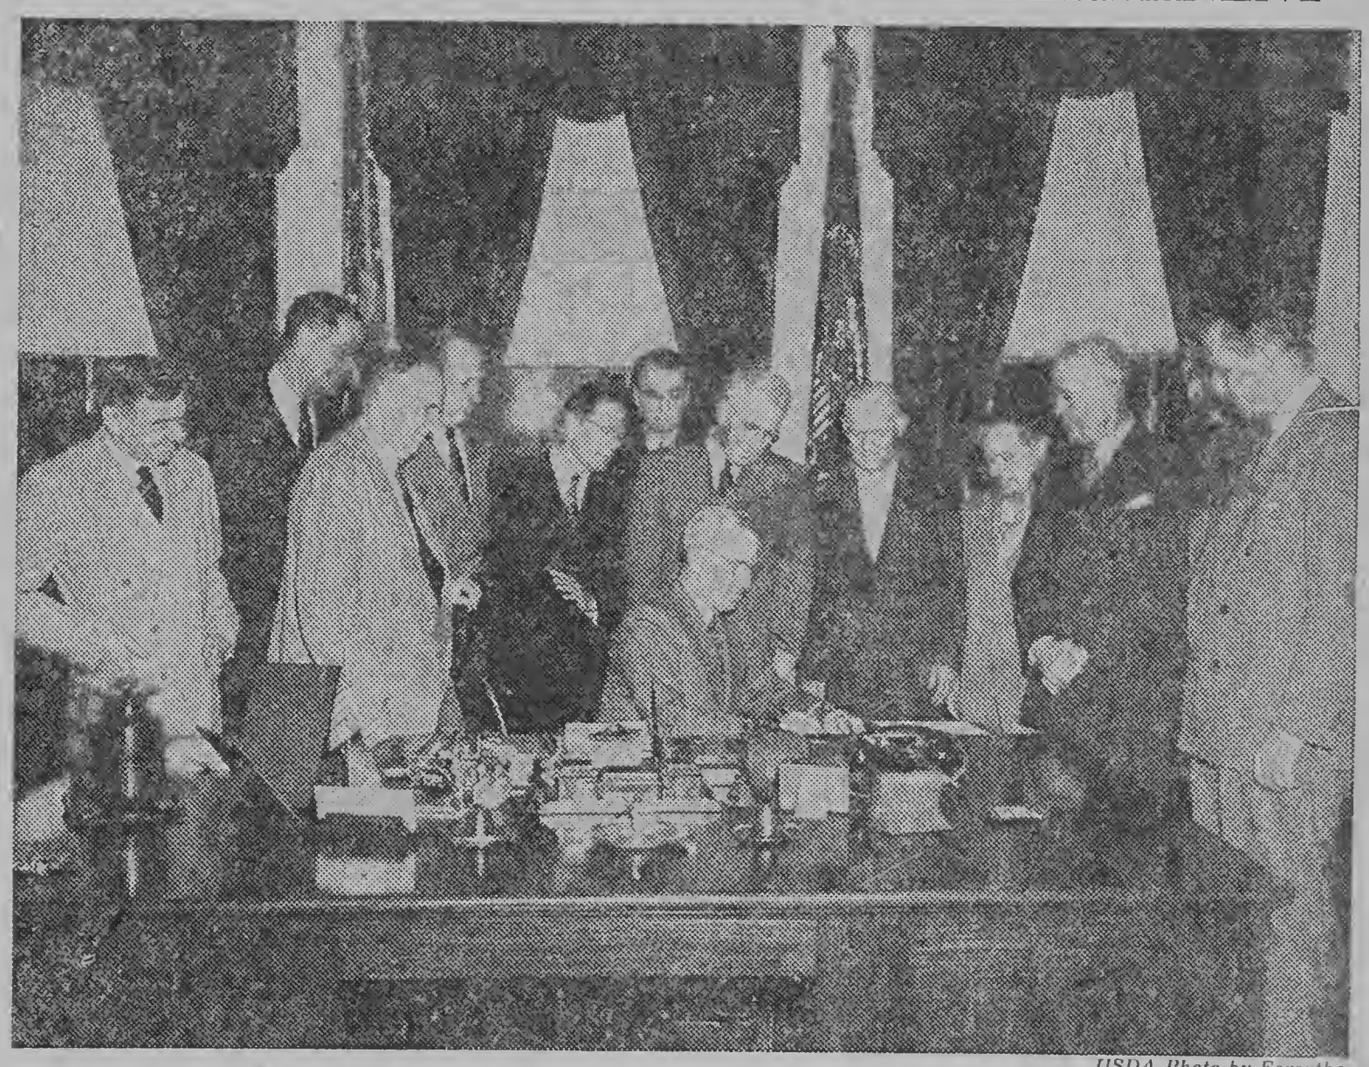
Fresh Kid: Give me a dime, Dad.

Dad: Don't you think you're getting too big to be forever asking for dimes?

Fresh Kid: I guess you're right, Dad. Let me have a dollar.

Dallas, Texas, is located approximately in the center of some 70 per cent of the nation's crude oil production. P. S.: So is Ft. Worth.

SCHOOL LUNCH PROGRAM MADE PERMANENT



USDA Photo by Forsythe

With President Truman signing the National School Lunch bill, the eleven-year-old program has become a permanent source of good nutrition for the white and colored school children of America. At the peak of the temporary program more than a million colored youngsters received lunches. Looking on, as the President signs the bill which authorizes the United States Department of Agriculture to assume half the expenses for school lunches in any State assuming the other half, are Agriculture officials and members of the Senate and House Agriculture Committees. Left to right: Rep. Clarence Cannon of Missouri, Secretary Clinton P. Anderson, Rep. Malcolm C. Tarver of Georgia, Sen. Richard Russell of Georgia, Sen. Allen Ellender of Lonisiana, Rep. Clifford R. Hope of Kansas, Sen. George D. Aiken of Vermont, Rep. John W. Flannagan of Virginia, Executive Assistant to the Secretary Nathan Koenig, Director of Food Distribution Programs Paul C. Stark, Under Secretary N. E. Dodd, and Production and Marketing Administrator Robert H. Shields.

WOMAN'S PAGE

FREEZE WITH EASE

For the homemaker with a locker cabinet that's the quickest and least troublesome method to preserve fruits and vegetables.

By MARY LYLES WILSON

With home freezing cabinets becoming available more people can enjoy this simple and successful method of preserving foods. Food can be prepared for freezing more quickly and with less work than by other methods of preservation, and when it is properly handled natural quality and nutritive values are retained.

Essentials of freezing are about the same as for successful canning. Selection of high-quality foods is important, for freezing does not improve low grade foods.

The slogan "an hour from the garden to the container" is still good, for fruits and vegetables are best suited for freezing when they are ready for immediate table use. Many foods lose food value and quality by standing.

Follow directions accurately and carefully. For best results blanch not more than one pound at a time, in order that adequate heat penetration may be assured.

Remember that not all waterproof material is moisture and vapor resistant, and make sure that foods are packaged in resistant material.

Rate of cooling depends not only on air temperature but on air movement and upon the size, shape and arrangement of the packages. In general, an air temperature of zero to 10 degrees F. is required for the initial freezing.

Sanitation and cleanliness in handling foods for freezing are most important. Be sure that the water used is pure and clean and that all utensils are clean and that no one is permitted to handle and pack the products until his or her hands are thoroughly washed. Remember that the most harmful bacteria comes from the soil. Peas should be washed before shelling and all other foods thoroughly cleansed.

Retention of the nutritive value of fruits and vegetables depends largely on their treatment before freezing and then on the storage temperature and methods of cooking and serving.

Pint sizes of food will be found most convenient for families of three or less. However, quart containers are usually more economical. A quart container will hold about six servings of most vegetables, while a quart of frozen fruits in syrup will provide about eight servings.

The folowing advice comes from Harry Colton, food processing specialist of the University of Tennessee.

All vegetables except sweet peppers and rhubarb should be blanched to stop the natural processes of growth and decay. Those two vegetables and fruits are protected from that activity by their acid contents. Fruits with the exception of apples, are usually not blanched.

If the period between harvesting and freezing is prolonged, freshness is lost, sugars change to starch, vitamins are destroyed and bacteria multiply. If delays are unavoidable, the product should be kept as cool as possible short of freezing. This is especially important with vegetables after they are blanched. Peas and beans retain freshness better when left in the pod.

Fruits are in two general classcleansed and prepared wholees: (1) small fruits, which can be without excessive injury to the skin and leakage of juice, and which do not oxidize or darken easily, and (2) fruits which should be pitted or peeled and which darken quickly when cut or peeled surfaces are exposed to the air.

Three methods are used in packing fruit: (1) dry pack (without sugar). (2) sugar pack, and (3) sugar-syrup pack. Tin containers if used should have fruit enamel linings. Plain unlined tin containers, however, may be used for dry packs if they are lined with leak-proof paper to prevent contact with the metal.

Fruits in the first class may be packed dry without sugar. Dry pack is used for fruits to be made into pies or for later processing into preserves, jelly or juices.

Fruit should be sorted carefully and usually washed. Then it should be well drained to prevent its freezing into a solid mass.

Fruits of the first class and cherries may be packaged by the sugar pack method, whole, sliced, chopped or crushed. One pound of sugar to three or four pounds of fruit should be used, the whole well mixed so that the fruit is coated by the dissolved sugar and juice. All sugar should be dissolved before freezing starts.

Fruits for all uses may be packed by this method. The sugar pack or sugar-syrup pack is usually preferred for desert purposes. Take note of the quantities of sugar so that the correct amounts may be added if frozen fruit is to be made into preserves or jellies.

All fruits may be packed in syrup which helps to prevent dehydration if the containers used are not strictly moisture and vapor proof. This process is not as desirable as the dry and sugar packs for pies or jellies. With this third method the fruit may be packed whole sliced, chopped, or crushed, covered with 40 to 60 per cent syrup (3¼ to 7 cups of sugar to one quart of water), according to taste and the acidity. The sugar may be dissolved in hot water, but the syrup must be cold when added to the fruit.

Wash, sort and trim vegetables before blanching. Cauliflower heads, broccoli and other large items should be divided into the sized pieces desired for serving. Small pieces blanch and freeze more quickly than large pieces and pack more easily into containers. It is not desirable, however, to expose any more cut surface than is necessary to the blanching steam or boiling water.

Vegetables are usually blanched by dipping into boiling water. Steam blanching may be used if equipment is available. Take care that steam reaches all parts of the product. Blanching times given for water blanching should be increased by one-half.

At least one gallon of boiling water should be allowed for each pound of vegetables, two gallons for spinach and other leafy vegetables which wilt quickly and tend to cling together. The object of blanching is to insure that every part of each individual piece is raised to the boiling point. For instance, corn on the cob must be scalded until the center of the cob has reached the required temperature: otherwise, within a short time, the spread of enzymic action will result in a disagreeable cob flavor.

But blanching too long will result in a loss of vitamins C and A and a lowering of the quality of the product. A slight overblanch is preferable to under-blanching.

Following are blanching times. Start count when boiling is resumed after immersion of vegetables.

	Minutes
Asparagus, small stalk	3½
Large stalk	4½
Lima beans, small	1
Medium	1½
Large	2
Snap beans	2-4
Broccoli, Small Pieces	3
Medium Pieces	4
Large Pieces	5
Cauliflower, Small Pieces	3
Medium Pieces	4
Large Pieces	5
Peas	1
Spinach	2½
Corn on cob—	
Small Ears	6
Medium Ears	8
Large Ears	10

After blanching, vegetables must be cooled quickly and thoroughly by dipping into the coldest water available, changing the water as it becomes warm.

When cool, the vegetables should be drained well, packed into containers and placed in the freezer as quickly as possible—preferably within three or four hours after harvesting. If they are allowed to return to room temperature, souring may result before freezing occurs.

Any moisture and vapor-proof container may be used. Tin containers, if used for asparagus or snap beans, should be lacquered or otherwise lined so that the product will not come in contact with the metal. Corn on the cob is usually wrapped in moisture-vapor proof material, one or two ears to the packabe.

STUFFED PEPPERS O'BRIEN

2 cups finely cubed spiced ham
3 cups shredded raw potatoes
¼ cup chopped onion
3 tablespoons chopped parsley
¼ teaspoon salt
2 tablespoons butter
4 large green peppers, parboiled

Combine spiced ham, potatoes, onion, parsley, and salt. Saute, stirring often, 15 minutes or until lightly browned. Halve green peppers; fill halves with mixture. Cover and bake ½ hour in moderate oven (350 degrees), removing cover last 10 minutes.

POTATO ONION PUFF

1½ cups boiled onions finely chopped
¾ cup cream
2 cups mashed potatoes
1 teaspoon salt
2 eggs
4 tablespoons parsley

Add onion and milk to mashed potatoes with salt and egg yolks. Beat until light and fluffy. Beat egg white until stiff and fold into potato-onion mixture with minced parsley. Bake in a greased casserole at 325 degrees 35 minutes. Increase degrees heat to 400 for five minutes to brown top.

SHRIMP, EGG AND MUSHROOM CASSEROLE

4 tablespoons butter or margarine
4 tablespoons flour
1 cup cream
1 cup milk
1 cup cooked mushrooms
4 hard-cooked eggs, cut in halves
2 cups cooked shrimp
1 teaspoon salt
¼ teaspoon white pepper
1 small green pepper, chopped fine
1 cup buttered crumbs

Make a sauce of the butter or margarine, flour, cream and milk. Add mushrooms. Remove yolks from halved hard-cooked eggs and cut whites in rings. Add to sauce with cooked shrimps, green pepper and seasonings. Break up egg yolks coarsely and toss lightly through the mixture. Place in a casserole and top with buttered crumbs which are nicely browned.

JELLIED FISH SALAD

2 cups cooked fish flakes
2 tablespoons gelatin
½ cup cold water
2 eggs
¾ teaspoon salt
¼ cup minced celery
1 teaspoon minced onion
¼ cup vinegar
¼ cup water

Soften the gelatin in ½ cup cold water. Beat the eggs and add the salt, celery, onion, vinegar, and ¼ cup water. Cook over boiling water until thickened. Add the softened gelatin and stir until it has dissolved; then add the fish. Pour into dampened molds. Let stand in a cold place until firmly set. Turn out on crisp lettuce and serve with mayonnaise.

The soybean makes glue, baby food, lipstick, candy and synthetic rubber among other things.

JELLIED VEGETABLE RING WITH COTTAGE CHEESE

1 envelope (1 tablespoon) unflavored gelatin
½ cup cold water
1 cup hot water
2 tablespoons sugar
1 tablespoon salt
6 tablespoons lemon juice
1 cup diced cucumber
1 cup sliced radishes
½ cup diced celery
1 pound cottage cheese
¼ cup minced onion
Few grains pepper

Soften gelatin in cold water; add hot water, stirring until gelatin is dissolved. Add sugar, ½ teaspoon salt and lemon juice. Chill until sirupy in consistency. Fold in cucumber, radishes and celery. Pour into ring mold which has been rinsed in cold water; chill until firm. Unmold on lettuce or watercress. Combine cottage cheese, onion, and remaining salt and pepper. Place in center of ring mold. Serves 6.

BAKED LUNCHEON EGGS, COSTA RICAN STYLE

3 tablespoons fat
1 clove garlic
1 cup chopped onions
½ cup rice, washed and drained
7 No. 2 can tomatoes
2 bouillon cubes
1 cup hot water
1 teaspoon salt
⅛ teaspoon pepper
6 eggs
1¼ cups hot cheese sauce

Melt fat in large frying pan. Add garlic and fry until lightly browned; discard garlic. Add onions and fry until browned. Add, and stir constantly until rice browns. Add tomatoes, bouillon cubes, water salt and pepper. Mix thoroughly. Cover and cook over low heat about 30 minutes, or until ric eis tender and all liquid absorbed, stirring occasionally.

Arrange rice in individual baking dishes. Break an egg in each one. Cover each egg with cheese sauce. Bake in a moderate over (375 degrees) about 15 minutes, or until eggs are firm. Makes 6 servings.

CHEESE SAUCE

Melt 2 tablespoons butter or margarine in saucepan; add 2 tablespoons flour and stir until smooth. Stir in slowly 1¼ cups milk. Cook, stirring constantly, until sauce is smooth and thickened.. Add ½ cup grated American cheese and stir until melted. Fold in ¾ cup sliced stuffed olives.

SUMMER PUNCH

2 quarts strong tea
1 quart apple juice
1 quart grape juice
1 2-3 cup strained lemon juice
4 cups strained orange juice
2 quarts water
1 cup sugar
6 9-ounce bottles ginger ale

Mix tea fruit juices, water and sugar; chill ½ day. Just before serving, add ginger ale and pour over large piece of ice in punch bowl. Make 8 quarts or 60 small glasses.

For a beautiful brown on pork or lamb chops dip them in milk before frying.

CANTALOUPE COCKTAIL

3 cups cantaloupe balls
1 cup orange juice
2 tablespoons lemon juice
Mint sprigs

Cut cantaloupe with vegetable ball cutter. Blend lemon and orange juice and pour over. Chill and serve garnished with mint.

USE LEFT OVER PEAS

Here's one for the frill. Remove a slice from blossom end of tomatoes. Scoop out part of pulp. Fill with cooked peas and broil ten minutes, three inches from flame.

Cooked cabbage held over hot water an hour to keep warm for serving, loses 70 to 80 per cent of vitamin C it had when freshly cooked.

SIMPLE DEVICE SAVES TIME FOR SEAMSTRESS

A pin-cushion wristlet is a simple, homemade device that can save the home seamstress much time and trouble, especially in fitting and draping and in measuring hems. It also is useful in fitting slip covers for furniture and in draping curtains.

In making a dress the seamstress often must reach for a pin fifty times or more. Unless pins are readily accessible, reaching and fumbling for them slows up work and means much unnecessary effort and irritation. A tray or box of pins may be convenient enough for the work that is done on the sewing table but for fitting and hem work the pin supply should move with the worker, and for this purpose a pin-cushion on the wrist is most convenient.

Make a round cushion about 2 inches thick and 3 inches wide, filled with hair or sawdust. Fasten this to an elastic band that will slip over the hand and hold in the position of a wrist watch.

A pin cushion attached to the arm of a sewing machine also may be a time-saver. When not in use, however, pins keep better in a tight box than in a cushion where they are likely to rust.

DRAPERY WASHING HINTS

In washing lined draperies, the lining should be loosed at the bottom. If it is not separately hemmed. This not only makes for better hanging in case of uneven shrinkage between lining and drapery material but also makes for easier ironing. Rayon draperies should always be ironed on the wrong side if possible. If they must be ironed on the right side, always use a pressing cloth. Iron draperies lengthwise, never across.

DRY BEFORE IRONING

When ironing rayon jersey, wait until it is thoroughly dry, turn the dress inside out and place on the ironing board. Dampen a light weight pressing cloth and lay this over the garment. When the material is cut on the bias, be sure to move your iron always with the thread of the material. In ironing a bias-cut skirt this will help to insure correct hang after the garment is done.

It is a good idea to send the children's stuffed toys to the drycleaner occasionally. During play they pick up quantities of dirt and dust which may not be noticeable.

If you wax-protect parchment lamp shades, venetian blinds, radiator covers, flower pots and wall plates and brackets, the cleaning job will be easier.

AVOID OVERHEATING

Do not overheat your paraffin. When it cools, overheated paraffin pulls away from the side of the glass. It should be barely melted and poured over jelly, jam,or preserves in a thin layer, making sure that the paraffin comes in direct contact with the glass all the way around. Add a thicker layer after the first is cold.

A good way to melt paraffin is to put it in an earthenware or enamel pitcher and set the pitcher in a pan of boiling water.

Coffee was first used in a form similar to a chocolate bar, rather than as a beverage.

FOR DRY BASEMENT

If cellar walls and pipes become moist during this summer, air the cellar out on cool nights or whenever the air outdoors is cooler than in the cellar. On days when the outdoor air is warmer, keep the cellar closed.

NEW COTTON HIGH

Huntsville, Ala., June 29—(Special)— Middling one-inch cotton brought 30 cents in the Huntsville market Tuesday, which was a new high in the record of 25 years.

Natural gas pipelines in the United States now total approximately 220,000 miles, as against about 141,000 for oil pipelines.

THE MODERN FARMER

VOL. XIX. NASHVILLE, TENN., AUGUST 15, 1946 No. 7

The Road Up

Still We Must Vote

By GILES A. HUBERT

Being of a rather placid nature, I do not like to become bitter about anything. But every now and then situations arise that "try men's souls" and it takes all the patience and godliness for one to keep his temper. But that we must do.

The recent federal court decision enfranchise Negroes and give them the right to vote in the Southern democratic primaries under the law and predict the end of legal jim-crowism in this country. In the cities of the South, in Georgia, Alabama, Mississippi, Texas and Arkansas, Negroes exercised this right for the first time in significant numbers. They voted intelligently and their vote counted.

The popular white vote in Georgia, Alabama, Arkansas and Texas demonstrated that a great number of white people in the South, if not even a majority of them, have no great dread of the Negro vote. A great many do welcome full citizenship for the Negro population.

But the rural county court house gangs throughout the South have never been interested in many people voting at all. Why? Because they could never be sure of controlling a large popular vote —they simply could not pay that many poll taxes. They have discouraged voting on part of the masses of white people.

Now with the threat of Negroes voting they are afraid for their positions of power. This is what they really mean by "White Supremacy." This is why they fight the abolition of the poll tax This is why they are attempting to throw the "fear of God" into Negroes to prevent them from even expecting to vote in rural areas. This is why they scare the poorer white people with the blatant picture of Negroes taking over the government and driving all of the white people out of office.

These local court house groups are the supporters of the Talmadges, the Bilbos, the Rankins and that whole crowd of demagogues. These are the ones who are the members of and sympathizers of the Ku Klux Klan.

These people have decided on and are putting into affect a planned and organized program of intimidation designed specifically to scare the small town and farm Negroes from ever expecting to vote. They shot down 4 young Negroes in cold blood in Georgia, they lynched three Negroes in Mississippi, hoodlums in Athens, Alabama ran all the Negroes oft the streets. The Ku Klux Klan is riding again with their white robes and burning crosses. They have set out to scare Negroes into submission and poor whites into line with them just as they did in re-

(Continued On page 2 Col. 1)

G. W. Senter Assistant County Agent Has Served Twenty Nine-Years

Has Trained and Helped Farmers In Williamson and Davidson Counties

It will be 29 years December 1 since G. W. Senter began his duties as assistant county agent in Nego work in Davidson County. Senter, a young graduate of the A. and I State College in 1917, began on foot his career with the U. T. Extension Service.

He not only had the agricultural training offered at A and I College but had served as manager of the college farm for two years following his graduation. This plus the training he had obtained while a boy on his home farm gave him the ability to talk the language of the people with whom he was to work--and in a way they would want to follow his advice.

When Senter first started working as an agent with the University of Tennessee he had to work in three counties--Sumner, Williamson, and Davidson. In later years Sumner was dropped from his list.

"The walking was just too much and too often," he said. "After spending two months on the road. I knew I can do a better job, much easier, with some means of transportation so I bought a "T"-model Ford, he said. "The roads were not as good then and Fords didn't cover ground as fast, but it was much better than walking," he continued.

In addition to his work with the adult farmers it was his duty to carry on a 4 H Club program with the Negro boys and girls which has continued for the past 29 years, with an enrollment of more than 600 boys this year.

Reviewing the changes that have taken place in the Negro way of farming during this period, Senter pointed out that a number of former tentant farmers and share croppers are now land owners.

(Continued On Page 2 Col. 3)

Anderson Asks Home-Makers To Can

Secretary of Agriculture Clinton P. Anderson is calling on white and colored home makers this year to equal their excellent 1945 canning record in order to make more food available for shipment to starving people abroad.

Secretary Anderson points out that rural and urban home-makers preserved 3½ billion quarts of food last year to help win the war. Of this amount, colored home-makers canned in excess of 200 million quarts. He says that it is necessary to can large quantities of food this year in order to help preserve the peace.

It is expected that while colored farm-women will take the lead in home-canning again this year, urban home makers will make a substantial contribution to the effort by canning surplus fruits and vegetables from their gardens and from the market when farm products are in plentiful supply.

In addition to canning, many home makers will dry, brine and store food stuffs. The colored county home demonstration agents have launched another food preservation campaign to help assure adequate conservation of food.
USDA 1606-46

Dallas Farm Woman Adds to Income by Selling Vegetables

Mrs. Sarah Douglas of Summer Grove Community is adding to her income by selling fresh vegetables to the cafes in Selma. She carries her vegetables to town three times a week. Her sales amount to $60 a month.

Mrs. Douglas is able to sell her vegetables because she gathers them at the right age and handles them carefully to keep from cutting and bruising them. Then she grades them well making neat packages or bunches. She grows plenty of the vegetables wanted by customers.

The recomended practices of the extension service are followed by this Dallas County woman in growing a year round garden. Her garden supplies vegetables for the daily needs of her family and enough to meet her canning budget, besides some for sale. "The cash coming in from my garden has been an aid in meeting the payments on our little farm." she says.

The success Mrs. Douglas has had in gardening has encouraged her neighbors to grow more vegetables in there gardens the year-round.

Press Winner Gets Trophy

Sherman Briscoe (right), information specialist of the U. S. Department of Agriculture, who won the Capital Press Club's annual award recently for out-standing reporting in 1945, shows Keith Himebaugh, USDA director of information, the trophy presented him. Ernest K. Lindley of Newsweek, Thomas Stokes of UP, and I. F. Stone of PM served as judges. Briscoe's winning article was entitled: School Marm Turns Dairy Maid and Succeeds. It appeared in the February, 1945, issue of Newspic, the publication which provided the trophy award.

Farm Woman Produces $3,300 Sideline Crop

Mrs. Rose Fugate, a colored farm woman of Kentucky, who started out growing strawberries as a sideline crop four years ago, netted $3,300 from her supplementary crop this year, according to a report received by the U. S. Department of Agriculture from the Kentucky State Extension Service.

Mrs. Fugate planted only a quarter of an acre of strawberries four years ago as a means of supplementing her cash income from tobacco. Each year, with the advice and assistance of her County agent, Russell Brown, she gradually increased her acreage. This year she planted four acres of strawberries, harvested an excellent crop, and added $3 300 to her farm income.

Land Values Force Farmers To Stick to Cotton

A major barrier to long-talked-of farm diversification in the cotton South is high land values. says Dudley E. Young, agricultural economist of the U. S. Departments of Agriculture.

Writing in a recent issue of the Journal of Land and Public Utility Economics, Young says that Land Prices justifiable at customary returns per acre are often an inescapable barrier when farmers wish to shift to a less intensive pattern of land use. He pointed out that a decline in farm income in the cotton South could bring wholesale foreclosure due to the fact that many farmers in the region have secured loans on their land in amounts based on the current price of cotton. Young says that high land prices and heavy debt are a substantial argument for continued

Farmers Urged To Insure Their 1947 Wheat Crop

Now is the time for farmers to apply for insurance on their 1947 wheat crop, J. H. Shoulders, director of Federal Crop Insurance Corporation in Tennessee, said this week. Shoulders reminded that farmers can now enjoy the same security on their wheat crops as they can on homes, automobiles and livestock when insured.

The Federal Crop Insurance program is different, however to other insurance in that it is sponsored by the government and is a non-profit organization. The program is not intended as a money making scheme for the farmer, Shoulders said, but it is a guarantee that he will at least "reap when he sows."

In giving reasons why farmers should insure wheat crops, he pointed out that records show wheat growers experience two losses every 10 years, one of which is a major loss. The insurance is an all risk insurance which protects the farmer from the time he plants his crop until it is harvested. Other evidence that the program is strongly favored by farmers is that a majority of the wheat producers in commercial wheat producing states carry the policy.

In Tennessee last year more than 2,500 farmers insured their crop, of which 300 claims have been paid, Shoulders said. The claims paid ranged from total loss to as low as two bushels.

"If a farmer was told that he would plant an additional half bushel of seed at planting time he would be guaranteed to harvest a normal yield, almost all of them would plant the extra amount," Shoulders said. "Well that is just exactly the guarantee he has un-

Still We Must Vote

(Continued From Page 1)

construction days.

But, the thing that is forgotten in all this is that this is not the South of 1870. Thousands of Negroes are not to be scared by these medieval antics and a great many whites do not approve and are willing and ready to take action against such cowardly and beastly acts.

Negro farmers must vote. If they had voted in their local counties in Georgie, Talmadge would not have been elected Governor of that State. Urban Negroes and their organizations must do everything in their power to urge the rural Negro to vote.

This, of course will be very difficult in areas where Negroes are sharecroppers on plantations. The cotton picking machines, however will soon displace many of these who must find themselves in the towns and cities. The salvation of these displaced people will depend partly on whether or not they become voters.

Again, there are thousands of farm owners and independent tenants, who must be encouraged to go to the polls in coming elections. Whether they can expect adequate aid from federal and state agencies such as the Farm Security Administration, the AAA, the Farm Credit Agencies, and the Extension service will depend in the future on their vote.

This is simply the way things are determined in a democracy— by the popular vote.

The Ku Klux Klan and its county court house gangs see this thing coming. They don't want democracy any more than Hitler did and for the same reason. They know that legally they can't prevent the Negro vote. They know now that the whole country and most of the decent white people in the South are willing at least to give democracy a chance.

They are scared to death. So what do they do? They go underground. They put on white hoods. They burn crosses under cover of darkness. They organize mobs and incite people to violence. These are not the acts of brave, courageous and upstanding people who are sure of their ground. They are the cowardly acts of the frightened bully who seeks to frighten the opposition so that he prevents having to meet his opponent in a fair contest in this case, at the polls.

Our job is to stand our ground. Let's not be frightened. We want to vote and we must vote. We owe this to ourselves, to our children who must come after us, and to all those (white and black alike) who are fighting the battle of democracy in this country and in the South.

If Negro rural leadership is worth anything at all, it will join this fight and encourage Negro farm and small town people to vote.

Rural Health Service Lags

"Competent authorities agree," Dr. Frederick D. Mott told the first annual meeting of the National Conference on Rural Health, "that $2 per capita is required to provide satisfactory public health services. Yet in rural counties the per capita expenditure for public health work is hardly 50 cents annually." Dr. Mott was a Senior Surgeon in the U. S. Public Health Service and formerly the Chief Medical Officer of the Farm Security Administration.

"Total expenditures by local health agencies in our most rural states in 1942 were at only half the rate of those in the most urban States. A study of Farm Security borrower families in 1940 showed that only 37 per eent of children up to 8 years of age had been vaccinated against smallpox either at public clinics or by private practitioners. In contrast 89 percent of children in this age group had been vaccinated in 28 large cities studied in the National Health Survey. The same story holds true for tuberculosis control, venereal disease control, health education, or almost any other accepted function of a local health department."

Land Values Force

(Continued From Page 1)

farm subsidy.

"The problem is particularly severe in the S uth," says Young, "because cotton is the major crop in the region and cotton prices have been held above the world level for more than a decade by government action."

USA 1543 45

Continuing, he points out that high land values limite programs which might be directed toward a farm pattern more in accord with full employment and a high consumption economy in the South.

Young's article is based on a study he made of land values in the Southeast. The States covered in the study include Alabama, Florida, Georgia, Mississippi, and South Carolina.

ANDERSON IN CUBA CONFERRING ON SUGAR

Secretary of Agriculture Clifton P. Anderson will return from Cuba this week after conferring there with President Romon Grau San Martin on current and future problems.

Secretary Anderson went to Cuba by air on July 8. He was accompanied by Senor Guillermo Belt, Cuban Ambassador to the United States, and James H. Marshall, director of the Department's Sugar Branch.

A. AND T. HELPS COLORED FARMERS BUILD PUREBRED DAIRY HERDS

A. and T. College of Greensboro, N. C., is playing a major role in helping the Colored farmers of North Carolina build purebred dairy herds, the State's Extension Service reports.

Each year the college makes more than a score of purebred animals available to 4 H boys and girls of the State. The animals are sold from the college herd at $100 each. Two years ago A. and T. sold 40 purebred Jersey heifers to 4 H'ers.

W. B. Harrison, colored county agent of Mecklenburg County, who placed purebred animals in 10 communities last year, says that continued good management by dairymen in charge of the A. and T. herd and sustained interest among farmers themselves give promise of bringing North Carolina out of the milk deficit class.

Farmers Urged

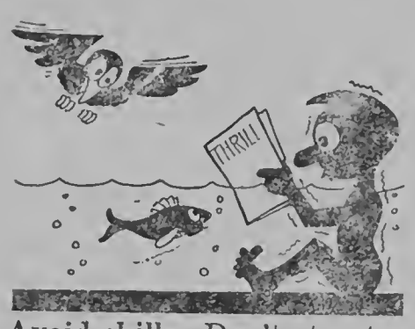
(Continued from page 1)

der the crop insurance program," he added.

Farmers wishing to apply for the insurance are advised to go to their local AAA office. The plan is for an agent of the corporation to contact all the wheat growers in counties where the insurance operates and explain the program to them. It is expected that more than 7,000 applications will be made.

Shoulders warned that with the cost of farm operation soaring at the present, farmers should take advantage of this opportunity. The closing date for accepting insurance application is September 28, Shoulders declared.

Fight Polio



Avoid chills. Don't stay too long in cold water.

Has Trained and

(Continued From Page 1)

These land owners are most cooperative when it comes to following recommended methods of farming such as terracing of land and seeding of alfalfa for hay, he declared.

During the past few years he has encouraged farmers to provide an adequate water supply for their livestock, resulting in the establishment of 17 farm ponds that have met the requirements of the AAA.

Senter talked, with pride, of the progress that has been made in poultry work among his people. He said many are now using modern means of brooding the chickens. "Even though most folks say they are losing money on chickens, we have had a number to tell us they cleared as high as 60 cents each on broilers; and when a Negro woman tells you she has made money, she has made money," he said.

In the past Senter had been called on to do a great deal of veternary work but now there is scarcely a community in the county that does not have former 4 H Club members who can do the job. Many of the farmers follow an all around program of vaccinating livestock for common diseases. Much of this work is done by the farmer themselves. More cover crops, dairy cows, permanent pastures, terraces, and beef cattle are present on Negro farms in Davidson County today than ever before, Senter said.

Close the Door

In this day and age, even with all the safety devices for fire prevention, there remains the necessity for quick thinking and acting by individuals when fire strikes.

Many articles have been written on the importance of knowing when not to open a door when fire threatens a building. A little advance thought or training on this subject can save an individual's life. If you awaken from a sleep and smell smoke, your first move should not be to jerk open the bed room door, instead put your hand on the door panel. If the wood is hot it means that the hall beyond is charged with lethal heat and gas that can kill almost instantly and that the stairway is probably cut off from use. Escape should be made by a window if possible, or at least call for help from a window. With a closed door between you and the fire you have every chance of surviving until rescue comes.

Next to the importance of not opening a door is the importance of closing doors during a fire. When a person is escaping from a room where a fire is raging, if he doesn't shut the door the fire is liable to overtake him before he can make an effective retreat—this is true particularly when time is needed to rescue another party.

Lethal gas ranging from 800 to 1,000 degrees a building. The two quickly flood a building. The two recent hotel fires graphieally illustrated the truth of these words.

Firemen agree that thousands of persons would still be alive if they had known and practiced the simple technique involved in opening or closing doors during a fire.

July's Basket of Plenty

Potatoes, onions, heavy tom turkeys and lemons are expected to be plentiful on markets the country over during July, according to marketing specialists of the U. S. Department of Agriculture In areas east of the Rockies markets generally will have an abundance of early peaches from the South. but California peaches are not duc until late in the month. Cantaloupes and watermelons promise to be more plentiful than last year. Eggs also will be in good supply throughout almost all parts of the country unless present shortages of food result in smaller production

Over the Dam

Thoughtful merchants recognize that sharp and abrupt price increases place ammunition in the hands of the "permanent control advocates" to extend their hold over production and sales of goods. In the normal course of events as production costs increase, the retail price of goods advances proportionately step by step. But in order to justify price regulation, normal advances in retail prices based on production costs have been delayed by catch phrases such as "hold the line" orders, "cost absorption" orders. etc.

When the prices of milk, butter and cheese should have been rising, they were held stationary and the farmer was paid subsidies to make the people think that living costs were actually being held down. But adjustment in prices is as inevitable as in the fact that a flowing stream will eventually go over the highest dam. The longer the delay in price adjustments, he greater will be the increases when they come. That is why it was finally necessary for OPA to increase butter 11c a pound and cheddar cheese 6c a pound in one order. These products had been underpriced so long that they practically disappeared from the market.

No one likes high prices but retail prices must follow wages, tax increases, and other costs of production as surely as night follows day. Long impounded prices are now going over the top of the price control dam. No matter how much advocates of permanent price control try to blame industry and the retailer for price increases, they cannot stop the trend until the cost of production stops rising. Either we will pay what it costs to produce or we will not get produetion You can pass a law to price butter at 25c a pound and nylon stockings at 25c a pair, but you will get neither butter nor stockings. The regulators cannot do the impossible any more than can the producers or retailers.

Leaf Growers Stay Within Acreage Limits

Less than half as many tobacco growers are exceeding their tobacco acreage allotments this year as did last year, according to an official of the state AAA office. as compliance checking reached the 50 per cent mark this week.

It is gratifying to know that so many farmers are cooperating, the spokesman said, but remarked that it was to their advantage to remain within their allotments. A producer that is within his allotment is assured a support price of 90 per cent of parity, as of October 1, in the case of burley growers which will be about 30 cents per pound This price will vary with grades. Support price on dark tobacco will be 75 per cent of burley and dark air cured 67 per cent of burley.

The support price will be in the form of a loan made by the tobacco associations in cooperation with the Commodity Credit Corporation However, the person owning the tobacco must be present at the market and turn his crop over to the association or it will be sold at prevailing prices.

With present prospects for an unusually good tobacco yield in almost all sections and with the supply on hand almost equal to the amount consumed during the past three years, it is highly possible that the market will not hold as high as last year. A man who exceeds his acreage allotment will receive only 60 per cent of the support price for his type and grade of tobacco and that will be on the poundage in excess of his allotment.

The penalty on excess is 16 cents per pound on all grades of burley as compared to 10 cents per pound last year. Penalties on other types of tobacco have increased proportionally. Chances are good that some grades of tobacco will sell for less than the penalty. Producers may get within their allotments by failing to market their excess tobacco.

Milking Formula Saves Time, Labor

Economists concerned with saving time and labor in farm work were able to reduce the milking time from 143 minutes to 77 minutes at the Kentucky Agricultural Experiment Station dairy in Lexington.

It was found that the use of less milking equipment reduced both labor and time. Use of Peterson's rapidmilking procedure also helped. Principal points in Paterson's formula for milking cows are:

1. Stimulate the cow to give down her milk by whiping the udder with a warm wet cloth about a minute before starting to milk.

2. Milk as rapidly as possible. With a machine the time can be cut down to 2½ to 3½ minutes for most cows.

3. Take the machine off just as soon as the milk is removed, being careful not to let the teat cups crawl up onto the slack under Strip with the machine by pulling the teat cups down into normal position and pressing gently on each quarter to get the last milk.

Pledge to the Consumer

One of the country's principal food chains recently made, thru the medium of newspaper advertisements, the following three-way pledge to its customers:

1. It will continue to pass on to customers the benefit of all savings made through its system of pricing at lowest point to yield a reasonable profit.

2. It will pay legitimate market prices to farmers and food producers.

3. It will do no speculative hoarding and will maintain the largest possible supplies of food to be made available equally to all customers.

In general, this is the way in which all kinds of retailers, dealing in all manner of commodities, can best serve the public in the battle against inflation.

No one knows where the price level will adjust itself. It is apparent that, in the light of vastly increased labor and other costs, prices cannot now return to prewar levels. It is equally apparent that retailers have no control over the wholesale or production price structure, save that resulting from their mass-purchasing power. But mass cooperation of all retailers such as that advertised by this food chain will save tremendous sums for consumers and help control the "inflationary spiral."

The majority of retailers have kept faith with the people. Even when all price controls were suddenly removed, they held price increases to the minimum within their control. Maximum efficiency in distribution plus maximum efficiency and output in in production hold the real solutions to the price problem.

Kentucky Grower Reaps $3,300 from Berries

Starting out years ago with a quarter acre of Blakemore strawberries, Mrs. Rosa, Fugate a Negro widow in Logan County, Kentucky, this season took in $3,300 above expenses from a four acre patch, according to Bennett K. Brown, Negro county agent.

The first year her quarter-acre brought her around $350. Then Brown encouraged her to expand her patch to an acre and a half. Applying fertilizer and using good care, she cleared about $1,250.

The third year she had two and a half acres of strawberries, but unfavorable weather and disease cut her income to about $400. This year she grew four acre, including a quarter-acre of Tennessee Skippers.

The Tennessee Skippers did so much better than the Blakemores that she is planning to grow no other kind. Brown stated.

Freeze It and Save It

SOUTH CAROLINA HAS CO-OPERATIVE FREEZER LOCKER PLANT TO AID IN FOOD CONSERVATION

It started out as just a cooperative freezer locker plant to lessen the inconvenience of farm living by providing slaughtering and curing facilities and freezer lockers to farmers. Today a business community has sprung up in lower Richland County, S. C., around this locker plant.

In addition to the freezer locker plant on a five acre tract there is a seed cleaning plant, a store has been opened with pumps for selling Esso gasoline, and farmers are talking erecting a sweet potato curing plant.

Formerly Richland County farmers had to travel to Columbia, fifteen miles away, when they needed to use slaughtering or curing facilities or when they had an oversupply of fruits and vegetables which could not be sold. Unless it was possible to can the oversupply, is was a complete waste. The establishment of the freezer locker plant has helped to solve these problems.

"Things are 100 per cent better than before we had the locker plant," says U. R. Cook, of barbecue fame, who lives on a farm in Horrell Hill but works in the Standard Oil Company of New Jersey offices in Columbia.

It was Mr. Cook who conducted the barbecue in 1944 at which many of the necessary pledges to take locker space were secured from farmers. At least 70 per cent of the locker space had to be rented and the annual $12 rentals collected before priorities for materials to build the plant could be obtained.

He listed other advantages, such as saving meat which would spoil because of sudden change in temperature and the lessening of the canning duties of the farm women.

Credit for fathering the idea and starting the movement for the plant is given to Robert Bailey, a Clemson College graduate, who became county agent in Richland County in 1944. Earlier he had helped establish a locker plant at Spartanburg, S. C., which had proven very successful. A lot of work in convincing and planning had to be done by Mr. Bailey and others interested in the project.

Mr. Bailey arrived in June, and by July he had talked up the locker plant to the point that a meeting of all lower Richland County farmers was called to discuss the project. R. M. McGregor, later elected to head the organizing committee, called the meeting, at which eighty five farmers were present. Other sub committees were formed to explain the plans with other farmers and farm women. Mr. Cook's barbecue added pledges to those obtained by the various sub-committees.

When 225 farmers producerses the required number of subscribers had advanced the $12 annual rental, the County under the leadership of Senator Joseph E. Berry, made a grant of $12,000 to the enterprise and the remainder of the overall price of $42,000 was borrowed from the bank.

Five acres of land were purchased and, after priorities had been obtained from the War Production Board, County Supervisor H. H. Hinnant gave the project help with labor for land clearance construction of foundations, digging a well and sewer lines and hauling materials.

The main building of the plant is built of 8 by 12 concrete blocks and a bungalow has been provided for Curtis Bozard, the general manager. Additional staff members are a bookkeeper, meat cutter and three helpers. The plant has a capacity of 25,000 to 30,000 pounds and is equipped to do a complete job on livestock, poultry, fruits and vegetables. The plant has a capacity of 308 lockers, and has a pork curing room, two beef chilling rooms, a bulk storage room, smoke room a room for dressing poultry and an abattoir.

Pork undergoes either the plain salt, smoke salt or sugar cure. Curing time is two to two and one-half days per pound. Pork when cured will keep in a dry place with or without refrigeration for a considerable length of time.

The plant can process about sixty hogs a day. A well-fed hog dresses down to about 70 per cent of its gross weight. When a hog is received, every cut is stamped with the identification number of its owner. Thus, no owner fails to get all of his own hog. Manager Bozard is now rendering the fat of each hog into lard in individual kettles.

H. H. Kelley, meat cutter, takes a professional pride in dressing the meat properly and he disapproves of hogs that are not fed properly before they are slaughtered. He isn't easily fooled as to how a hog has been fed for he reads the hog's history from the manner in which its meat dresses out.

"Not long ago," he said, "I dressed one batch of hogs that had been fed on "swill" for six months, followed by soybeans and corn for ninety days. It was impossible to turn out good cuts, for the meat was too soft and flabby to handle well. Those hogs should have been put on corn and tankage for thirty days before they were killed. Corn fed hogs turn out the finest, hardest meat.

"We are trying to educate people to bring in only quality stuff. We advocate that farmers bring in their hogs for us to slaughter as well as dress up. Some farmers have kept meat at home for two or three months and have them brought it in to us, but we refused to accept it."

"This co op is going to furnish a means for disposition of excess farm products; in fact, it already has done so," said Mr. Bailey. "A farmer who has a couple of hogs can keep one for his own use and then let the plant process the other. The plant then disposes of the sausage, fresh pork, bacon and hams during the season. Vegetables and fruits are handled in much the same way.

"Thus surplus farm produce will always be available to those desiring it. Farmers who were careless about their excess produce now are aware of its value. By having it processed and sold at the plant, they are able to realize something from this suplus.

"In many cases this surplus represents the farmer's real profit from his farm. He gets the full price for his excess, which formerly was thrown on the market at low prices. Moreover it improves the living of the farmer, since he has better food for his own table. Formerly much of the pork used in the farmhouse was so salty it was unpalatable."

Board of directors of the association are R. M. McGregor, president; T. S. Armour, vice president; B. A. Jordan, Jr., secretary treasurer; Louis La Conte, J. A. Burnside. W. E. Allison, D. P. Cloaninger, S. O. Wiggins, A. W. Layton, J. A. Darnold, J. M. Bates and Frank Hampton.

There are about 5,000 modern locker plants making available sub-zero degree freezers and zero degree storage compartments at the present time in the United States Many of these were built during the war years and many more would have been built had materials been available. Information on locker plants can be obtained from county agents and other public agricultural workers.

Harry W. Dearing, agricultural engineer of the Tennessee Coal, Iron and Railroad Company, Birmingham, Ala., and formerly of the agricultural engineering department of the Alabama Polytechnic Institute, has prepared plans and supervised the construction of several plants in Alabama and in other southern states. He lists the main advantages of freezer lockers as being that they allow farmers to add beef to an otherwise heavy proportion of pork, they take the gamble out of meat curing and they allow farmers to prepare meat at any time when the animal reaches the desired weight and finish for slaughter.

He predicts that many farmers who are not close to public locker plants will add the home-size frozen food storage units which are now being made available on the market. Every farmer and livestock producer will find that the expense of this unit or of renting a locker in the central plant will be well repaid in the saving of food and the improvement of the farm food supply, he believes.

"It has usually been found to be more efficient and economical to deliver the live animals to freezer plant or abbatoir and have all slaughtering, chilling, cutting, curing and freezing done there," Mr. Dearing points out. He adds that this applies to both renters of lockers and owners of home freezers. These plants and abbatoirs have facilities for processing animals which are not available on farms.

The United States Department of Agriculture has just issued a bulletin, AIS-48 "Home Freezing of Fruits and Vegetables," which offers detailed instructions in the preparation of various products for freezing, sealing and storage. It can be obtained through state agricultural colleges or county and home demonstration agents.

Fight Polio

Avoid removal of tonsils or adenoids prior to and during polio epidemic season.

LETTERS FROM PASTORS

The Rev. H. V. Greene, Pastor of the Chapel A. M. E. Church, Moultrie, writes as of June 19, 1946:

Dear Dr. Edwards:

I hasten to congratulate you for the very fine and newsy news Letter received from your office just a day or two ago. Every article was good and deeply interesting. Surely, the work is making great progress throughout the State, and Georgia Council of Town and Country Pastors and the auxiliary of Mission Women could well rise up and congratulate themselves for the very excellent leadership you are giving.

Mrs. Greene and three of our other workers took advantage of the short course offered at Clarke College the first of June. They report that the work was very interesting and profitable, and now they are putting much of that which they learned into practice in a Daily Vacation Bible School here at Grant Chapel. The student body ranges in age from those still being fed from a bottle to a grandmother. Seventy-eight were present this morning, and they probably will be registering up until the last day. The boy or girl instrumental in bringing in the largest number of people during the Bible School will be given a free trip to our District Congress of Religious Education, which, by the way, you may be interested to know, will convene Wednesday evening, June 26, and will continue through Friday evening. June 28. We all would be happy if you could run down to Sylvester, Ga., for the occasion.

I am planning to meet you at Gammon in Atlanta, July 1, unless you advise me differently.

Your fellow worker,
H. Vernon Greene.

The Rev. J. L. Hightower Pastor of the Damascus Circuit, Damascus, writes as of June 15, 1946:

Dear Mr. Edwards:

Everything goes well with me. Truly hope you are enjoying the choicest blessings of God.

Very sorry I was not here on your last visit, but understand that you were able to make some very fine contacts which is very helpful to our program here.

I only had one meeting to any degree of success since our organization. We have added only about ten new ones to our list; but we are lining up very nicely. However, there is much to do.

I had planned for a big meeting on July 4th, to try to gather around a thousand folk here, and had hoped we would have been able to get you here for our main speaker on the occasion.

We are having a big Barbe-cue and the Carnation Gospel Singers of Macon, Georgia will render the music.

Since your program is arranged that you will be in Atlanta on that date I am writing Mr. Newton the agricultural agent of Early County to be our speaker. If it's possible for him to come, I am sure he will be of a great assistance in helping to get the farmers lined up.

I regret very much that I cannot meet with you in the Pastors School in Atlanta. Wishing you a large attendance and a great success.

Yours in the joy of his service,
Rev. J. L. Hightower.

Calling all Pastors for Their Pledges: The pastors who made pledges to be paid by April 1st, 1946 and the group of Council members who attended the Albany School whose pledges were to be paid in by May 1, 1946, this is to call this very important matter to your attention. The Vacation Bible School Program is now beginning, and funds are needed to help many rural and village communities to help themselves. As reported in a previous "Letter" a few pastors have kept their word with the Councils almost depleted Treasury. If both acknowledged and appreciated if you who have not done so, will pay your pledge immediately. In so doing you will help the Council's work to go on.

TOWN AND COUNTRY CHURCH MISSIONARY WOMEN

Communication from Executive Secretary of United Council of Church Women: The members of the Georgia Council of Town and Country Missionary Church Women who attended the Fort Valley meeting may be interested to know that the Executive Secretary has received a very favorable reply from Mrs. Worrell, the Executive Secretary of the United Council of Church Women concerning the matter of membership in the Georgia Council of Church Women. In this letter Mrs. Worrell also stated the annual Nat'l Church Women's meeting will be held this fall in Grand Rapids, Michigan. She urges that the Georgia Council of Town and Country Women be represented by capable persons.

It was the writers' good fortune to meet Mrs. Worrell in person since receiving her letter at Lake Geneva, Wisconsin. Again she reassured me that the matter which claims our attention will be satisfactorily handled. She also told me of the part the United Council played in selecting Mrs. Clement for the "Typical American Mother" in 1946. You will be interested and pleased to know that a Negro woman has been appointed as assistant Executive Secretary of the United Council of Church Women. That is, through Mrs. Worrell's influence a Negro woman from Bennett College, North Carolina, is being added to the paid staff of the United Council of Church Women. It is my desire that at least two persons will represent the Georgia Council at Grand Rapids in November this year.

Vacation Bible School Records: Those who are holding Vacation Bible Schools are asked to keep accurate records of enrollment, attendance, and the number of teachers. In order that other members may know and be inspired by what you are doing. I am urging that you make a report to our office as soon as the school is closed. If possible make pictures of the groups in action. For the pictures sent to my office I will gladly pay for the same. In the report to my office I would appreciate it if a brief statement is made concerning the things in the school, the response of the children, which pleased the teachers in the school.

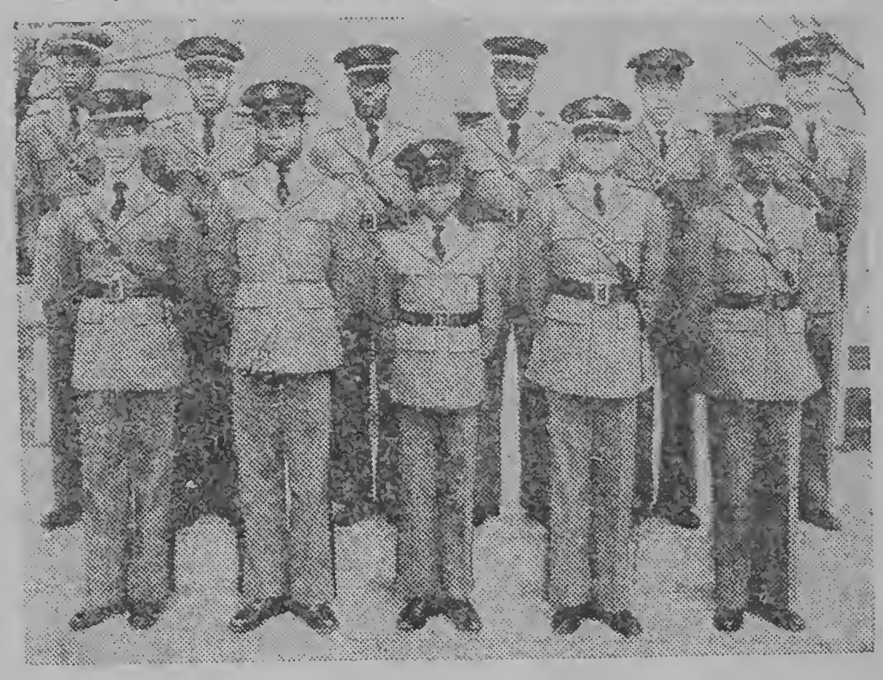
RURAL YOUTH AND THE COMMUNITY

Today's Opportunities: The provisions made by the GI Bill of Rights where-by world war II veterans may further their education along lines of their specific interests are being used by a large number of youth. The opportunity for farm youth to get first hand, practical training in agriculture with unheard of financial aid which may be used for home ownership by a goodly number of Negro Youth. But the room for improvement at this point is large

Recreation: "Practically every rural community needs a program of recreation which will take the place of the existing forms in the community which the church so often condemns. However, the church frequently does nothing to replace these undesirable forms of wholesome activities. With the invasion of rural communities by road-houses and other commercialized forms of amusement, and with the increasing mobility of our population there is an ever-growing need that the church awake to its responsibility in this area of rural life and provide, or help to provide a varied program of recreation for every age level in the parish.

From a Manual for Town and Country Churches, by H. S. Randolph.

St. Emma Commencement



ROCK CASTLE, Va.—Diplomas were handed to the graduating class of the St. Emma Military Academy at an impressive ceremony on Commencement Day. The Cadets shown in the photographs are, front row, left to right: Capt. Francis Baril, Mississippi; Sgt. Plater Campbell, District of Columbia; Sgt. Edwin Jenkins, Alabama; Lt. Anthony Points, Alabama; Lt. Richard Harris, District of Columbia. Back row, Lt. Ferdinand Wilson, Maryland; Capt. Cecil Best, Connecticut; Capt. Wilbur Clarke, New York; Capt. George Hogan, Virginia; Lt. James Miller, Oklahoma; Lt. Harrison E. Hairston, Ohio.

Unbalanced Economy

It has been estimated that cooperative enterprises exempt from Federal income taxes did a $12,000,000,000 business in 1945. Tax-exempt business is expanding rapidly and making a more formidable gash in the nation's tax revenue needed to run government.

The question is, How can a national economy work with a large percentage of its productive machinery tax exempt, which requires that remaining business be overly taxed? This is an unhealthy condition and an injustice to those who pay the taxes.

With the government seeking new sources of revenue, private business would do well to make an issue of the growing list of tax exempt "free riders."

Plan Now

To keep bean beetles from multiplying in your garden by removing and burning infested bean vines that are no longer producing.

To clip all pastures that a mower will go over.

To take extra care of your poultry flock during the hot, dry weather.

To buy only those things that are necessary for comfortable living.

To insure your 1947 wheat crop with the Federal Crop Insurance Corporation.

To dig potatoes before they rot in the ground.

To plant fall vegetables where the spring crop had already been harvested.

To market your fat cattle when the pasture begins to get short unless you have supplementary pastures.

To help hold prices down by not asking excessive prices for things you have to sell.

To take advantage of recent rains by preparing the land for fall seedings.

To increase your annual farm income through the production of sheep.

To continue the fight against garden insects. Many fall vegetable crops are lost due to insects that were allowed to mature in spring gardens.

To continue to have good pastures by clipping weeds and tough grass.

To take off a few days, if you aren't a dairyman, when crops are finished and before fall hay harvest time, and go fishing or visiting.

To buy only those things for which you can pay cash without cashing your bonds or mortgaging your farm.

To can and store enough food for family needs this winter.

To continue to plant vegetables in the garden as other vegetables mature.

To attend the regular monthly meetings of your community club.

To swap work with your neighbor during tobacco cutting season if labor is not available.

To cut lespedeza hay while it is still green to the ground. A good grade of hay, saved now, will prevent the feeding of costly grain this winter.

To prime as much of the tobacco crop as time will permit.

Farm Bureau and Extension Service Trying To Swipe Soil Conservation

There's a move under way by the Extension Service — and its political arm, the Farm Bureau— to grab the Soil Conservation Service.

The political power of the Farm Bureau has been used often in an effort to tear down, or take over, other farm agencies. This move to take over Soil Conservation appears to be aimed at increasing the power of the Extension Service and Farm Bureau.

The plan to take Soil Conservation was proceeding in Washington very quietly. No word about it had been said in Farm Bureau publications or conventions. The Soil Conservation and its friends waked up to what was happening.

The Soil Conservation Service refused to be taken without a fight. Farmers who know how well the Soil Conservation has been run— and that farmers themselves control the work of the Soil Conservation District—have gone into action.

Many of the county Farm Bureaus, which often do not go along with the program of the State and Washington Farm Bureaus, joined in the fight. They were against having Soil Conservation's program taken over.

The Extension Service in some states managed to get control of the A.A.A. It has also tried to wreck or take over the Farm Security Administration.

In many states, and in many counties, the Extension Service sticks to helping farmers to do a better job. In others it is trying to build up power. These programs are used in many cases to do favors for a few leading Farm Bureau members once the Extension Service gets control.

It seems now that the Farm Bureau plan to take over Soil Conservation may have been blocked. However, one of the methods used by the Farm Bureau and Extension Service when they want to capture another agency is to fight first to reduce the agency's appropriation. That is a "softening up" treatment which weakens the agency and makes it easier to attack it.

Whether the Soil Conservation Service will find that the Farm Bureau will have its funds cut remains to be seen.

That Old 'Outsider' Bunk

"We don't want any outsiders telling us what to do."

Every now and then we get a letter that has this line in it. In recent weeks, we've had several from Georgia and Mississippi.

This is a line that Bilbo and Talmadge like to preach. They try to make people believe that no one is against them except "outsiders."

That's a lot of bunk.

For every 52 voters who were for Bilbo in Mississippi, at least 48 were against him.The 48 who were against Bilbo are just as much Mississippians as the 52 who voted for him. They believe just as much in law and order, and go to church as often, as those who voted for Bilbo.

It happens we're on their side.

It also happens that it does matter to those of us in Alabama whether Bilbo is in the U. S. Senate. Every time he votes against a bill that helps the common man—it hurts the common man in Alabama.

The same thing is true of Georgia. Only in Georgia there were about 58 voters against Talmadge for every 42 who wanted Talmadge.

When Talmadge almost wrecked Georgia's colleges by forcing some of his hickory-nut headed leaders on the boards of trustees—he hurt the whole South.

So we are 100 per cent behind the 58 voters out of every 100 in Georgia who are against Talmadge.

If what we have to say makes sense, it makes just as much sense if we lived in Rabun Gap as it does when we are living in Montgomery, Alabama.

From—(The Southern Farmer)

A Negro Newspaper's View on Voting

Official figures on the results of the Richmond County (Augusta, Ga.) primary election ..... which repudiated Speaker Roy Harris and his Cracker Party, which has been in power there over 20 years, disclose some interesting facts.

First, a majority of the white voters in the county voted for the Independents, thereby repudiating Roy Harris and his Cracker Party and their issue of the campaign, "white supremacy" and the restoration of the white primary. This is significant in that the majority of the white people are showing they don't believe in denying the Negro the right to vote in the primary. This should be a clear notice to the rabble-rousing, race-baiting candidates of the futility of their efforts.

Second, that 1,994 Negroes voted for the Independents and 437 for the Crackers. At first it would seem that this is a small percentage out of a registration of 4,600. But the fact that several hundred Negroes who had been in line to vote long before the polls closed only to be turned away at the closing time, partly explains this. However, there has not been explained how Speaker Harris and his Cracker Party, who ran on a platform committed to disenfranchise our race, got even one Negro vote. For instance, in the Fourth Ward Harris and his ticket received 352 Negro votes as against only 221 for the Independents. It should be noted, however it was in this ward where several hundred Negroes in all probability anti-Harris votes, were turned away at closing time of the election. But suppose the election had been closer and it would have been revealed that Harris and his party won by the margin of the Negro vote? This could have happened. Every single vote is important and every citizen must realize this. We can take no chances with our precious ballots.

We will have little choice in the next few elections. Our simple duty must be to concentrate on the best candidate or ticket to assure that a race-baiting demogogue will not slip into office through a divisoon of the votes. This is common sense and it is a matter of self-defense.

When the race issue is gotten out of the campaigns then we can be normal citizens and consider the candidates and tickets on their merits as to political and economic principles. But until then, we have little individual choice, less we, through division, become re-enslaved politically.

Also we noticed in the Augusta election the practice of using separate voting booths for Negroes was carried out. This enabled officials to tell just how the Negroes voted. This fact may explain why the Cracker Party got some Negro votes. We happen to know that the Cracker Party cracked the whip over the head of every Negro it could reach and demanded support of their ticket. One Negro of questionable influence who was obligated to the Crackers and could not square his conscience with the idea of supporting the Crackers wanted to leave town but he was warned not to do so until after the election.

All in all, considering this election was probably the first time of voting for most of the Negro participants, we have no criticism for their conduct. And, of course, we are very gratified over the results of the election.

(Atlanta Daily World).

Farm Talk With Farm Folk

by JESSE SAFLEY

Following our comparison a few weeks ago of the producer's selling price with the consumers' purchasing price on milk we would like to give a few facts and figures on what the truck farmer receives for his products as compared to the price the consumer must pay at the retail market.

While a cabbage crop has practically rotted in the fields in West Tennessee, less than two hundred miles from Nashville, where the farmers cannot sell their products for, even one-fourth cent per pound the consumer is still paying from three to six cents per pound for cabbage, depending on the market visited.

Still closer home in Franklin County the potato crop is being purchased by the PMA at floor price, which is two cents per pound for "grade A" potatoes, because commercial buyers were not offering that much; yet the consumer is having to pay five to seven cents per pound for potatoes.

Greens, which brings the farmers less than three cents per pound, cost the consumer 10 to 16 cents per pound. Tomatoes, which are yielding the farmer more today than almost any other truck crop are worth about 10 cents per pound to them; but they are worth from 20 to 25 cents per pound in the hands of the retailers. Green beans have been wholesaling for less than five cents per pound and are retailing at 12 to 14 cents. The farmer is receiving about three cents per ear for his corn; the consumer is paying seven to eight cents. Squash that has been wholesaling at less than one cent per pound still retails for five to eight cents per pound.

We could name any number of other vegetables but the price factor would be just the same. The producers of these products are receiving about one-third of the amount the consumers pay for the product.

We are not unmindful of the fact that transportation plays a major roll in the cost of fresh vegetables, and we know that the margin between the producer and the consumer price must be sufficient to care for that portion of the product that will be lost and allow the merchants a profit --but we fail to see where it is necessary to double and redouble the price on the consumer.

We are sure that most consumers fail to realize the condition when they pay 25 cents for a pound of tomatoes or eight cents for a pound of potatoes. It is true that truck farmers have made money during the past few years, but just think how much more his products have cost the consumer than he has received.

Now is the time of year when many gardeners forget their garden. The sun is hot, weeds are large, insects are plentiful and excuses numerous, but now is not the right time to "let up." Even though you have grown a most desirable garden this spring there are just as many reasons why you should do the same during the summer--and these reasons are all in your favor.

There are definitely fewer vegetables being sold on the local curb market than were sold this time last year. Whether the amount will increase will depend largely on the weather conditions during the next few weeks.

If you have suitable soil on which to grow vegetables we believe, by all means you should grow them. But if your soil is not desirable, too poor, too shady, too many cinders, we would be the last to suggest that you waste

time and seed trying to produce vegetables. Even an expert could not grow a garden where some enthusiastic "Victory Gardeners" have tried to grow them.

Assuming that you are planning a fall garden we will suggest that you grow vegetables which will most nearly suit the plot on which you plan to work.

Remember it is more profitable to do a good job growing a few vegetables than a poor job trying to grow a large number.

Book Review

Sermonic Expositions No. 1. by George W. Harvey, Published privately at 1227 Villa Place, Nashville. $1.00 by mail.

Here is a compilation of sermons which will be especially useful in the hands of the busy minister, but which also have special value for other members of the Church. Pithy, to the point, they represent the results of some hard thinking on Christian themes, and reduce basic religious truths to terms understandable by the average member of the congregation.

The interests of the author, expressed in his Sermonic Expositions are wide. His is no single tracked message. He presents the Christian Gospel in living terms, sound in scholarship, yet pregnant with fire and spirit. The arrangement of the expositions is logical, beginning with "What It Means to Be a Christian," and ending with "Life's Proving Ground." In between are discussed 33 topics such as "The Light of Faith," "The Church's True Glory," "Not Far from the Kingdom," "The Gospel Objectives," "The Cross in Christian life," "The Roads of Christian Experience," "The Certainty of Religious Experience," "The Meaning of a Christian's Experience."

This book is very helpful in every way, and easily worth $1.00. There are thirty-three Sermonic of Religion," and "The Beginning Expositions in this book.

CLOVER SEEDS NEED BEES

Bees are essential for the production of clover seed. Wild bees help to do this job as well as the honey bee, but the number of wild bees are usually too small for complete pollination of the clover. A farmer wishing to produce this type of seed should keep at least one colony of bees for each two acres of clover grown or be certain there are bees within two miles of this field.

Newspaper misprint from a Georgia paper: "Mr. and Mrs. J. J. Smith and little son, Adam, have returned from a visit to relatives in Florida."

Cover Crop Need Emphasized by Food Shortages

Food and feed shortages throughout the world emphasize the need for unbroken farm production and point out a contribution Tennessee farmers can make toward world peace, Director C. E. Brehm, of the U T College of Agriculture and the Extension Service, said this week in stressing the statewide cover crop drive. The drive, which started this month, will be carried to every farm family by extension workers and farm leaders.

The drive to "keep Tennessee green" is of three sided appeal; to build and conserve soil fertility and increase farm income; to produce feed for livestock; and to increase food production for use at home and to relieve famine areas of other lands. Many farmers will have to reduce their livestock numbers still more unless more feed is grown at home. The problem, however can be dealt with if some two or three million acres which lie idle during the winter are kept in production. The seeding of this land not only will provide and conserve badly needed feed, but will also aid in erosion control.

There is a place on the majority of Tennessee farms for acreages of both winter legumes and small grains. The choice of these is determined mainly by the type of land, and its future use. County agents who will go all out in the cover crop drive can be of assistance in determining the best choice for particular soils.

Problems which the farmer must face immediately include getting an adequate supply of adapted seeds, arranging for early and orderly flow of fertilizers, and settling upon a program for winter land use.

Cotton Research Outlook Better, Speaker Asserts

Jackson,Tenn., July 27--(AP)--The outlook for tremendous expansion in cotton research is better now than at any other time in history, President Oscar Johnstone of the National Cotton Council said in an address to the Tennessee Cotton Ginners Association this week.

The Scott, Miss., cotton man said the agricultural research bill now pending before the senate make possible an annual federal cotton research expenditure of more than 20 million dollars.

"This amount coupled with the approximately four million dollars now being spent on cotton research by all agencies will give cotton the opportunity it needs to keep technologically abrest of its competitors," Johnston said. "Without a research fund near the 25 million dollar mark, cotton's hope to remain a major factor in the American economic system is indeed slim."

Referring to harvesting of the current cotton crop, Johnston said the pick sack shortage is unusually severe and "there is small prospect that a great deal can be done." He added that "the six month delay of the Civilian Production Administration in issuing a fabric allocation order appears to be the principal reason for the present shortage."

Johnston said that, in the economic sense, there had never been a cotton surplus. Instead, he said, "the problem is one of under-consumption and not over production."

National Barrow Show Scheduled In Minnesota

The official premium list of the National Barrow Show and Swine Industry Congress to be held in Austin, Minnesota, September 16-19 has just been released by the show management committee.

The show is, as its name implies, primarily a barrow show. There are classes in all breeds for barrows, single and pens of three, both lightweight and heavyweight. In addition. there is a class for boars and a class for gilts. And to top off the competition among purebreeds there is a breeder-feeder litter class, each such entry made up of a boar, gilt, and barrow all from the same litter.

This is a strictly spring pig show as all entries must have been farrowed on or after March 1, 1946. Moreover, the barrow side of the show is accentuated by the fact that no exhibitor may enter boars or gilts unless he also enters one or more barrows.

There will also be classes in both weights for truck loads of market hogs. Each such load must consist of fifteen animals, which may be barrows, gilts, or both; purebreads: crossbreds; grades: or any combination.

The show will close with a national sale of prize-winning boars and gilts of each breed as well as an auction of all barrows and truck load lots of market hogs. A total of $21,645 in prizes will be awarded.

Nature Governs Milk Butterfat Tests Show

by MARVIN E. FARRIS
Test Man, Nashville Milk Producer, Inc.

The natural variation in the butterfat content of milk is considerable and often more than is usually suspected. This natural variation is closely associated with the breed of cattle, individual cows within a breed, and with the stage of lactation for individual cows.

The variation of butterfat content of milk among the different breeds is a matter of general knowledge.

The average for a breed is oftimes misleading in the case of individual cows. It is possible and sometimes happens that a particular cow will produce milk that contains much more butterfat than a cow of her breed should. For this reason it is always a good policy to have the milk of each heifer tested as she takes her place in the milk herd.

The stage of lactation also has a marked influence on the butterfat content of a cow's milk. During the first ninety days of lactation the butterfat content is lowest. The percentage of butterfat will then gradually increase for a few weeks and level off as it reaches the percentage nature intended should be average for the cow in question.

As a cow nears the end of her lactation the butterfat content will again noticeably but gradually increase. This is accompanied by a reduction in the flow of milk. There may be as much as one and one-half per cent difference in the butterfat content of a cow's milk when comparing the first month with the last month in a lactation. It is normal that the butterfat content of a cow's milk will rise as the flow of milk decreases. Of course there will be more total butterfat produced daily during the early stage of lactation than later on even through the fat percentage is lower at that time.

Because the vast majority of cows still freshen in the spring it is natural to think of spring as a low testing period and fall and winter as high testing periods. The stage of lactation is the important factor here and not the season of the year. Proper feeding is very important, but the benefits gained are through a greater flow of milk for a longer period rather than higher testing milk. Feed will not materially affect the butterfat content of milk over a period of time. Nature controls this.

The natural variation of milk tests, then, is oftimes considerable; but in the case of individual cows nature has provided that this is gradual and follows a cycle closely associated with the stage of lactation and the flow of milk. Artifical methods of materially changing the butterfat content of milk by feeding have not proved practical thus far. Nature still governs the richness of milk that our cows produce.

Farm Families Urged to Use Beef, Lamb

Little beef and lamb are used by farm families, and yet both are delicious if produced from young, well-finished animals, Grady Sellards, of the Kentucky College of Agriculture and Home Economics. pointed out this week in a plea for the use of more home-produced food.

"There is a wide prejudice against lamb," he said, "many disliking the tallowy flavor. To a lesser extent this prejudice prevails against beef. This dislike usually stems from the animal flavor of the product if consumed too soon after slaughter, and improper refrigeration.

"Tallowy flavor in lamb can be overcome by proper handling and cooking with very little of the tallow.

"Both beef and lamb can be produced largely, if not entirely, on good pasture. Many farmers prefer to finish the animals on grain. But pasture-produced beef may be of just as good quality as the grain-fed product.

"Now is the time to organize meat rings, each member of which furnishes a fat beef or lamb. Thus excellent beef and lamb can be had throughout the year by all members. In all cases facilities for chilling both lamb and beef and ageing the meat for a few days should be made. If frozen food locker service is available, it will serve the purpose well. But if not available, and the weather is warm, other arrangements should be made to chill and age the products."

Fight Polio

Don't get overtired. Extreme fatigue makes you an easier victim.

Dark-Fired Leaf Growers Get Top Figure for Crop

Murray, Ky., July 20-(AP)-Dark-fired tobacco growers of this district received a record average price of $29.25 a 100 pounds for their 1945 crop, Boone Hill of Benton, president of the Western Dark-Fired tobacco Growers' Association, recently reported at the annual meeting of the association here.

Hill's report showed the district produced 11,977,888 pounds at the $29.25 average last year, compared with 15,248,137 pounds which brought an average of $22.89 a hundredweight in 1944.

The association president reported the organization has 11,906 members in 11 counties. Of these, only six members sought cancellation of their contracts, he added. The eight Kentucky counties represented are Ballard, Calloway, Carlisle, Fulton, Hickman, Graves, McBracken and Marshall. Three Tennessee counties having association members are Henry, Weakley and Obion.

Hill declared that since the association's formation "the price has increased from an average of $2.66 in 1931" to the all-time high. "Through our general manager, L. L. Veal of Murray, we obtained a loan from Commodity Credit Corporation to make advances and handle the 1945 crop," Hill said. "Our commitment covered dark-fired type 23 and air-cured one-sucker type 35."

Hill said, "Though we make advances to a very few members, the schedule . . . is conclusive evidence that the association has a major part in obtaining more money for the tobacco grower this past year than was ever known."

According to the association's marketing agreement, Hill explained, members sell their tobacco at the barn or over the loose-leaf floor.

E. E. Shanklin of Dresden, Tenn., is first vice president of the association; S. C. Huddleston of Whitlock Tenn., second vice president, and Joe E. Pace of Murray, secretary-treasurer.

They Knew Better

In the railroad strike a surprising attitude was taken by the strike leaders. It was the attitude generally assumed by the uniformed irresponsibles who call themselves liberals and contend with monotonous stupidity that strikers are the downtrodden thousands while the operators of industry are three or four iron-hearted millionaires. The railroad strikers knew better than this. They know that the railroads are owned by hundreds of thousands of persons--among them many railroad workers. They know that railroad managements have a heavy responsibility to these owners.

A member of Congress, Representative Oren Harris has ably summed up the question of railroad ownership. He reminds railroad workers and everyone else that "the real owners of transportation today are life insurance policyholders, savings bank depositors, beneficiaries of trust funds, educational and charitable foundations colleges and hospitals, and hundreds of thousands of relatively small investors.

"The heads that roll into the basket when the dread blade of bankruptcy falls are not those of brass hatted tycoons, but are the heads of our friends and neighbors who are the real owners of transportation or are the beneficiaries of foundations, colleges and hospitals that own the securities."

When it comes right down to it, there are very few persons who do not have some kind of a stake in the railroads. The acts of the labor union chiefs are very much like those of dictatorial rulers who claim the divine right to expropriate the savings and property of others for use of a chosen few.

A few good winter cover crops help the dairy farmer to serve something for a "grainy" day.

Politics Hinders Farm Electrification

According to a feature article in the New York Times, the private electric companies of the United States have set up a budget of $300,000,000 to be spent during the next three years for the construction of electric lines in rural areas. This money when expended will create assessable property on the tax rolls of the communities involved.

The private companies have sought to cooperate with the REA Administrator to complete electrification of the nation's 6,000,000 farms, but have been rebuffed. What sound excuse is there for such an attitude which delays farm electrification?

More and more one is led to the conclusion that the national program for government ownership of the electric industry is not so much concerned with getting electric power to the people as it is with driving private companies out of business and establishing a socialized electric system in their stead. Where private companies plan to put up $300,000,000 for farm electrification, the REA has been trying to get a Federal grant of $585,000,000 in tax funds to loan to tax-subsidized electric cooperatives during the next three years. A large part of this money would be used to duplicate or prevent private electric companies from rendering services in the territories involved.

What hope is there for tax reduction or encouragement of private enterprise when a powerful government bureau takes such a non cooperative attitude toward the endeavors of private citizens and taxpayers and fosters unfair competition? Only the people can correct such a situation in their expressed sentiment for or against it.

Modern Coal Mining

Mining coal is not just a question of sending men into a hole in the ground with picks and shovels to dig the black gold out. A correspondent for the Christian Science Monitor, after visiting some of the mines, writes: "A typical modern coal mine, bringing out from 2,500 to 8,000 tons of coal a day, is a huge engineering operation, operated on careful cost accounting and on plans which anticipate operations for as many as in some cases, 20 years ahead.' His story of the coal mines is interesting.

No two mines are alike because of varying geological conditions. The roof of one mine may crack and fall as the coal is withdrawn, that of another may bend and sag. Each requires a different type of operation. Equipment ordered this years and delivered next may not be suitable at time of delivery, "for the mine management must sometimes try to predict the unpredictable and calculate the incalculable."

Cost of getting the coal out can be seriously affected by the steepness of the grade up which it must be hauled to the surface. A few degrees of upgrade for bringing the coal out may cost $100,000 a year in extra equipment and power requirements.

"Ventilation is another major problem," writes this observer. "A typical modern mine pumps in over 200,000 cubic feet of fresh air a minute ----------

"Safety measures appear everywhere. Except right at the working face, whitish rock dust is sifted over everything to dilute the coal dust which may be stirred up, down to below the explosion point. Foreman go round tapping roofs in the rooms. Timber shoring requirements are rigid. Foreman carry safety lamps. variation in the flame of which indicate the methane (swamp-gas) content of the air, oxygen conditions, etc. Printed signs in the lamp-house and illuminated signs along the main line underground urge caution on behalf of the wife and children."

This is a different picture of coal mining than customarily given the public.

Future of State's Tobacco Crop Is Timely Question

ROY H. MILTON
Extension Tobacco Specialist

Even though blue mold made a heavy attack on the tobacco beds in the state, Tennessee had the earliest and most plentiful crop of plants I have ever seen. The earliest crop was set and perhaps the best stand in Tennessee's history obtained .The land continued wet until the greater part of the crop had been set and started to grow, then the rains ceased and an opportunity was given growers to cultivate their crop.

The crop was probably freer of crabgrass and weeds than it has been in the last decade. Few if any crops have made a better start. The conditions were very promising for several weeks.

Then something happened in a large number of fields. Plants began to bloom prematurely; in other words they began to bloom at a height of 12, 18 and 24 inches. Why? That is the question on the minds of many tobacco growers It was the writer's privilege to attend a meeting of Experiment Station Research Workers at Tifton, Georgia, recently. At that time, I presented the question to the fertilizer men, and each shook his head and replied: "I don't know."

This is not the first time that I have seen tobacco bloom prematurely. I have noticed in the past, when a crop was set early and the setting period was followed by a cool, wet, cloudy period, mainly where tobacco has been fertilized heavily or was on rich land, the plants bloomed too low, especially when the wet period was followed by a dry period, which was the case this year. No doubt something happened to the internal structure of the plant it was thrown more or less into a dormant state, and too frequently when plants are stunted by any means, they make an effort to reproduce their kind of produc in blooms and seed pods. So evidently the dry period following the extremely cool, wet period, threw tobacco plants into a dormant stage and they thereby set to work to produce seed. Please understand, that is my theory.

I have observed that the narrow leaf variety; known as Barnett Special, has been more severely attacked by black root, and that the plants bloomed much more freely than plants in adjacent or nearby fields set to Kentucky 16 or 41 A.

Now the question is: Where does the crop go from here?" Heavy rains have descended during the past two weeks, and water has run in the tobacco furrows. Many fields I have observed have wilted. I have been asked what caused a field of tobacco to suddenly wilt, and what can be done to remedy the situation. It is my opinion that the air was cut off from the roots by the water, and that the plant drowned like a human being when he gets into water over his head. The oxygen supply is cut off and the man drown. It has been my observation in the past that, when a tobacco plant wilts like it does when water runs into a basin in which tobacco has been set, the crop never returns to normalcy. In other words, the plants turn yellow and eventually dry up on the hill. If the crop would be saved, the tobacco must be cut in the wilted or yellowing condition and placed in the curing barn.

Spraying tobacco beds with Bordeaux mixture has not yet become a universal practice. Wildfire appared in a few tobacco beds in almost every county in the state. That means that wildfire is scattered throughout Tennessee. Should these heavy rains continue for another ten days ,wildfire may spread across the state and take a heavy toll out of the tobacco crop. Today we need sunshine and more sunshine in the centeral part of the state.

The "Charge Account" Comes Due

For years the people have been lulled into the belief that the nation could run indefinitely by spending more than it took in, and still avoid inflation. This was sleight of hand reasoning that those who learned that two and two make four could not understand. They were pooh-poohed into silence if they mentioned their ideas. To carry out the illusion of "holding the line," subsidies to the tune of billions of dollars to pay producers part of the cost for what the consumer purchased, were resorted to--the subsidy came out of the taxpayer and helped pile up the deficit and hide inflation. Then came the cost adsorption" illusion whereby the retailer was forced to absorb growing production costs.

But the old rule that two and two make four still stands. In order to have anything to eat or wear, OPA has had to increase the price for both producer and retailer to make up for the accumulation of wage increases and tax increases which for years were hidden in government deficit spending. As the cost of living goes up, our standard of living goes down because the average person does without or substitutes inferior for better goods.

It is useless to blame the manufacturer or the retailer for high prices. They have to work on the formula that two and two make four. Encouragement of industrial activity, increased production per man, and the old fashion habit of saving, thrift, and reduction in government debt are the only protection against inflation--all the laws, rules, regulations and regimentation to the country.

America: The land where in one generation a family can rise from a plain cabin to a cabin plane.

YOUR MERCHANT FRIEND

"A period of raising prices and raising cost of living is now to get underway," forecasts the United States News. "This is the period when the nation's 38,000,000 families will pay for the wage increases and for the striking among other things, that marked the first half of 1946."

As to just what tendencies the trend will take, is any man's guess. Some think the price rises will be relatively gradual. Others gloomily forecast a catastrophic inflation, ending in a crash. Details notwithstanding, practically everyone seems agreed that price boosts are necessary and unavoidable, and that all the talk about "holding the price line" in the face of the most extreme wage increases in history is just empty talk designed for native ears

The role of the nation's distribution system during this period will be an all important one. Your merchant, be he large or small, a chain or an independent, can't prevent price increases caused by influences entirely beyond his control. He can't sell you something that costs him a dollar, for eighty-nine cents. What he can do--and what he will do--is to hold prices at the retail level to the minimum by efficient, economical operation of his store.

American merchandising is superbly geared to do this job. The basis of the system lies in competition--open, honest competition by all kinds of stores. The door is wide open to the innovator, the man who has a new idea, who wants to do a little better job and get more customers by doing it. He will do all in his power to cushion whatever "price shocks" lie in store for us.

Fight Polio

Don't swim in polluted waters.

Are You Having A Hard Time Getting Butter?

Competition At Its Best

The United States was built by competitive private enterprises. Its industries, large or small always were resourceful. The principal beneficiary was the public because it was the first to enjoy improvements.

Two outstanding industries in the nation have always competed in developing efficient fuels for the operation of the country's railroads and power units. Coal and oil have a fine record of achievement in serving the nation's transportation system with constantly improved fuel.

For years the railroads had to depend on cord wood. Then coal became available and outmoded wood. But competition arrived when oil was found to be a highly efficient fuel, as well as economical. For years the oil diesel has been a growing mode of power.

To meet the competition of oil burning diesel engines, the coal industry has been developing a gas turbine engine to use powdered coal. This type of engine bids fair to become as famous as the oil burning diesel. What the oil and coal industries have accomplished by way of research from which industry and public benefit is a good example of how competition brings achievement. Under private enterprise no industry is large enough to ignore a competitor, however small.

Coal Mining Meets Its Obligations

Coal mining in the United States, according to Coal Age, was in all likelihood the only coal industry in the world to raise individual productivity during the war years.

The major factors in this record were new equipment and techniques which made possible substantial increases in operating efficiency. As Coal Age put it, "Those outlays of money and thought enable coal mining in the United States to meet its wartime obligations in full, in sharp contrast to the record in other countries!"

Constant progress in the American coal industry in the fields of production, safety and economy has placed it sharply ahead of its counterpart in other countries.

The importance of coal to a country has not been dimmed by the development of other sources of heat and power. Practically every important industrial operation requires the use of coal--and lots of coal somewhere along the line. All of us remember when, during the recent coal strike, it was officially reported that unless production was immediately resumed industrial activity would come to almost a standstill. The future of coal mining will directly influence the future of all the American people.

"Health" Vs. "Medical Care"

Writing in Medical Economics, Dr. Lowell S. Goin points out that one grave weakness in most proposed health legislation is to use the term "medical care" and "health" as if they were synonymous. The truth is that medical care is only one part of the health problem. Health consists of not being sick; medical care. on the other hand, consists of efforts to cure or alleviate disease.

In advocating health legislation, to quote Dr. Goin, "Too much confidence is placed in preventive medicine-----The legislation evidences a complete failure to understand that preventive medicine simply has not attained the goals wished for.

"To cite a very few of the problems: How shall heart disease--- be prevented? How shall we prevent, or even recognize, early brain tumors? ---What periodic examination makes one aware of the pneumonia of next week?"

The Wagner-Murray-Dingell-Bill now pending in Congress, is guilty of this confusion between "health" and "medical care." Its objectives, in the opinion of many authorities, are not possible at this time. It would regiment the doctor, thus discouraging initiative and progress. The chance of its having any important beneficial effect on the public health is remote. Its cost, to employer, worker and taxpayer, would be enormous. It would limit the individual's freedom of choice in selecting a physician. Good as many of its provisions are, it should not become law in its present form

Make the Farms Hum

by GRACE ARMSTRONG ALLEN

Whenever and wherever people meet to discuss farming problems there should be at least a small corner of space and time devoted to bookkeeping. Like poultry, bees can be kept on small lots in town, as a sideline. But they should be an integral part of every farm. Statistics show more than 200,000 colonies of bees in Tennessee in 1945, with the United States Department of Agriculture advising five or six thousand more. That puts it up to us.

Most people know nothing about bees except that they sting and make honey—and nothing about honey except that it is delicious. Honey is also beneficial and is a marvelous source of energy. And bees are beneficial as marvelous pollinizers. In fact, agricultural economists claim that the entire national honey crop is less important than the bees' pollination of orchards grains, etc.

So let's have more bees in Tennessee. But let's handle them intelligently. You can't keep them profitably by the know-nothing system. There is a lot to know. Fortunately, up to date farmers are eager to learn. There are government and state bulletins, bee journals and books. beekeepers' associations and meetings. And it is all excitingly interesting

For various reasons beekeeping in Tennessee slumped badly during the 1930's. In late 1944 things began to change. Through 1945 a vigorous campaign was waged for education, increase, organization, and improvement. Things are now humming—both bees and beekeepers. Heading up this recent activity is John M. Amos, appointed state apiarist in 1945 and carrying on tirelessly to increase Tennessee's bee population and honey crop.

Beekeepers need special knowledge along three main lines: the bees themselves; nectar sources and seasons; and beekeeping management, the technique of which is based directly on this essential knowledge of bees and nectar sources, plus the recorded experience of thousands of beekeepers and one's own experience as it develops through the years.

Here is a bird's eye—or bee's eye—glimpse of the kinds of things one needs to know about the bees themselves; the three types—Queen, worker, and drone—and their life histories, what each one does, and how, and when, and sometimes why; something of their anatomy, to help answer the "why," and in general to understand them better.

If some one says that a bee has six legs, four wings, five eyes, and two stomachs, are you going to believe him? (You'll be saying it yourself soon.) If he says that queens never sting, they mate only once, and lay two different kinds of eggs, you'll want to know whether he's right or not. (He is, if you know just what exceptions to make.) If he says that the drone has no father but does have a grandfather, you'd like to know whether to jump to his defense or join the doubting Thomases. (Go to the defense.) What do bees do in winter? Would a drone starve to death in a clover field? Do bees have diseases? Yes, yes, a thousand times yes. In his report for 1945, Mr. Amos said he and his assistants had inspected more than 1,000 apiaries (bee yards, of course) for disease, and found it in about 150 yards. That's one of our big current problems. Every intelligent beekeeper wants to be able to recognize disease in his hives and know what to do about it.

As to nectar sources, no one wants to be like the beekeeper who made himself famous by stating, weeks after basswood bloom had faded and gone, that his bees were all ready for the basswood flow. From the pollen in the first early blooming forest trees to the nectar in the last frozen wild aster, the beekeeper should know what his bees have access to. Do bees, by the way, get nectar from alfalfa in Tennessee? If not, why not? There's been many a yes and no argument. Have you seen bees—honeybees—on your alfalfa bloom?

As to management. Bedford Forrest should have made a good beekeeper. On his famous "get-there-first with the most" principle, he would have had strong colonies all ready to send out vast armies of foragers to attack the various brigades of blossom as soon as they appeared in the field—fruit bloom locust tulip tree, linden, the different clovers, and so on to aster. There are many nectar bearing plants, of varying degrees of importance. Only this very June, at the beekeepers' meeting which was reported on this page, held at the apiary of State President Harry McClain at Morrison, some of us who have kept bees first vetch 30 years saw our first vetch honey. McClain's county had acres of vetch, and his bees were ready for the bloom. Fine honey it was, too.

One must not only have the bees ready for the various flows, but must have ample room for the bees to store the nectar while ripening it into honey; and then must know when, how and how much to take off. No true beekeeper "robs the bees." He manages them so that they store more than they need (which is plenty), and he takes the surplus.

There are many other things to know about managing bees, of course—as how to handle a swarm. You needn't ring bells and beat pans, even if you do read in newspapers that some people do it! But the $64 question is, "How can I prevent swarming?" A swarming colony seldom produces surplus. Yet there have been—and doubtless still are—men who have boasted about a colony that swarmed six or seven times one year. Others have complained that bees don't do well where they live, because the moths kill them. The moths don't kill them out if the beekeeper gives the right care to his bees.

Yes, there is much to learn in beekeeping. There are plenty of ups and downs. It's not a get rich quick scheme, any more than any other phase of farming, but there's enough profit to make it well worthwhile. And there's fun in both the learn and the doing.

So let's make Tennessee farms hum!

HOME FREEZERS HELP TO IMPROVE LIFE ON FARM; VALUABLE FOR STORAGE

by KENNETH B. MCPHERSON

There are many applications of refrigeration to the farm and home. Included among these are the household refrigerator, the ice box, the walkin cooler, and now another is being added to the list the "Home Freezer."

The farm and home freezer is probably the most talked about refrigeration equipment for farm use today. It is something new that will be widely accepted by those who enjoy providing themselves with super quality food.

It is significant that it was even necessary to set up terminology for this equipment. Many terms have been used such as "Sharp Freezer," "Quick Freezer," "Harder Freezer," and many others. Because of the different terms that were becoming confusing, the National Electrical Manufacturers Association at a meeting in Chicago on April 26, 1944, officially recommended the name "Home Freezer" for the "household type of low temperature, mechanically refrigerated cabinet used exclusively for freezing and for storage of frozen food."

Many different types, designs, shapes and sizes of freezers will be produced and placed on the market. Among them will be the chest type home freezer with lift top. Upright freezers with vertical doors will also be available. In some cases doors may be smaller than the cross section area of the compartment. Upright units may have inner doors to prevent spilling of cold air when the outer doors are opened. Others may be equipped with drawers similar to filing cases.

Large size, upright, two temperature reachin and walkin refrigarators with a portion devoted to frozen foods and the balance to household refrigeration of prehaps 35° to 40° F., will also be available. The walkin two temperature units will be a combination cooler and freezer. The temperature of the former will be approximately 38° F. and the latter zero. This type of unit will permit chilling and curing of meat before cutting, wrapping and freezing. There are several units of this latter type in the Nashville area at the present time.

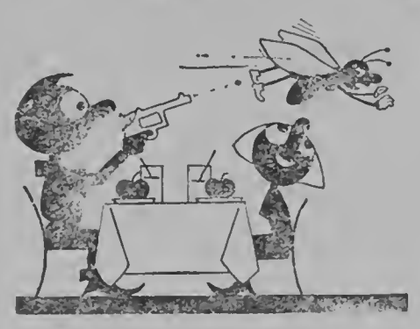
Some have raised the question, "what will happen to my frozen food in case of a current interruption?" Tests have been run to determine the rate of thawing in a well filled box.

Dr. D. K. Tresselr states, "In experimental tests, food in a well filled two cu. ft., cabinet did not thaw to any considerable extent until 72 hours after the current was cut off. The upper layer of packages did not rise above 32° F., until 96 hours had elapsed,even through the ambient temperature was 80° F. The bottom layer of packages required more than 120 hours to thaw. Similar results were obtained in a test of a four cu. ft., home freezer. The larger the freezer, the longer the thawing time."

The home freezer will be another electrical instrument to help make better living on the farm.

Meat and vegetables can be processed and frozen in their prime, right where they are produced, and stored away for use out-of season months later.

Fight Polio



Keep clean. Wash hands before eating. Keep flies and other insects away from food.

Protecting Cattle From Witches

by IDA M. PARDUE

It has been too long since most everyone believed in witches—and many were the strange charms practiced to protect not only human, but also animals.

Not all these charms have fallen into disuse. In some parts of the world, people still follow ancient customs guaranteed to keep witches at a safe distance.

Many a British peasant still ties bits of rowan over the barn door, and nods with satisfaction as he does so,realizing that no witch will come within a mile of a red berry.

For the same reason rowan berries are fed to new-born lambs as everybody knows that witches take particular delight in harming these babies.

In Germany, sick cattle were once treated simply by hanging sprays of bittersweet around their necks.

One of the strangest of all diseases prevention customs was the fire ritual once held yearly on the Palilia, feast day of Pales, goddess of shepherds.

To invoke the aid of the diety in keeping the sheep from distemper, the shepherds built bonfires and jumped over the flames.

Modern Trend of Electric Appliances Contributes to Postwar Farm Home

by KENNETH B. McPHERSON

The question is frequently asked of those of us who in the rural electrification business, what new electric appliances can we expect in the postwar home? That question is a good one. It shows that people are thinking in terms of living in the electric age. It shows that they are letting electricity help to carry the burden of living and remove the wrinkles from their faces.

Very few household electric appliances have been manufactured since 1942. Now that production is starting again it is well to investigate what the future may have in store.

Something close to 140 household electric appliances have been developed and are now or soon will be available. This does not include all types of lights and basement shop tools.

In the field of home lighting, studies made as to the number of lamps that may be used in a modern home indicate that the total for all uses may approximate the 200 mark. This includes lamps for the radio, sewing machine, electric clock, cellar switch, house number, toys, ornaments, range, refrigerator, iron, door bell push button, and many others. There will be infra red lamps for the relief of aches and pains, and for drying hair and fingernail polish, bacticidal lamps for killing whatever germs the air may contain, and sun lamps for producing a swimming beach sun tan in the bedroom at home in the winter.

Refrigeration for the home will change. The home freezer will probably make it possible to cook complete well balanced meals that can be served simply by thawing and heating. It would seem likely that a busy housewife might get a cook one or two days per month and prepare most of the food for the next month.

The dish washer will be available to rinse, wash, spray and then dry the dishes by means of a blast of hot air. All the housewife will have to do will be to put in the dishes, pots, pans, glasses and silverware and push a button.

Electric sinks will dispose of garbage. Bones will be ground finely and washed down the drain.

Washing machines and ironers will be improved. One clothes washer can be converted into a dishwasher or a potato peeler by removing the washing mechanism and inserting the other devices. It is understood that an ice cream freezer and butter churn may be developed for this unit.

Many small appliances like mixers will have such accessories as oil dropper, food slicer, knife sharpener, ice chipper, juice extractor, can opener, silver buffer and others.

The electric heating pad and blanket will be so developed that each bed occupant will be able to regulate his or her side of the bed to suit his own comfort. Entire house will be heated electrically. Many in both city and county are being so equipped now.

It is understood that electric clock will be built to control not only an alarm, but the radio as well. Set the clock for favorite programs and they will come on automatically and not be forgotten. One clock is contemplated that will regulate small appliances. It will, they say, awake you up to music in the morning, and start the electric percolator and toaster as you arise. These appliances are connected to an outlet on the back of the clock case.

Small household flour and cereal mills will make flour and meal in the house.

Electric rat and mouse traps will be on the market. But will be placed in a small space in front of the electrodes. In trying to get to the bait the mouse will be electrocuted. The dead animal will be expelled from the trap which is automatically reset and ready for the next victim.

There will be many other conveniences in the form of new appliances and improvements to old ones. All of them will make their contribution to happier home life on the farm.

Prepare Now for Next Year's Tobacco Crop

by ROY H. MILTON

Tobacco growers have you given any thought to the 1947 tobacco crop? If not, it occurs to me that the time is right to get busy. Regardless of whether you plan to burn your bed or treat with calcium cyanamid, as a large number of growers did last fall, the time to start preparation for the 1947 crop of plants is at hand.

I suggest you start today. Weeds, as you know, do not wait. They have one idea; that is, to reproduce their kind. The early maturing weeds and wild grasses have already begun to produce seed in abundance. When these weed seeds fall on the ground, they must be killed by some method of sterilization. Three methods of sterilization are now in use in Tennessee; namely, (1) burning, (2) steaming, and (3) using a chemical known commercially as calcium cyanamid. The last method has been in use in this state for several years but, during the war period, the chemical could not be obtained. Now it can be obtained on a number of markets.

In getting ready for the 1947 crop, the first thing you will do will be to select a bed site; and unless you plan to treat your tobacco bed site with Bordeaux mixture for wildfire prevention, and with Fermate, copper oil or P. D. B. for blue mold control, you had better change your bed site. It is a known fact that wildfire germs and blue mold germs are carried over in old bed sites, and all too frequently, the disease first makes its appearance where old bed sites have been chosen. I repeat that it is dangerous business to plant old bed sites.

Secondly, unless the bed site has been sown to cowpeas, soybeans or some other crop, destroy the weeds and wild grass growing on that site by some method, such as shaving off with a hoe or turning with a turning plow early, then cultivating at intervals of, say, 10 days until frost has come or the bed has been treated with calcium cyanamid. The idea is not to let any weed or wildgrass seeds mature on your 1947 bed site.

Where a grower elects to treat his bed chemically, I would make the following suggestions:

1. Sometime in October or early November, spray 100 pounds of calcium cyanamid broadcast over each 1000 square yards of bed.

2. Turn the bed site.

3. Apply 75 pounds of calcium cyanamid and work it deeply and thoroughly into the land with a three shovel plow or dish harrow, smooth it and at the same time, break up clods with a 14-tooth cultivator, a Gee Whiz or a spike tooth harrow.

4. Apply 25 pounds of calcium cyanamid to the surface and rake it in lightly with a garden rake.

I might add further that it is my belief that the addition at seeding time of a nitrogenous fertilizer in a tobacco bed that has been chemically treated is dangerous

Seed may be destroyed in germinating, or the plants may even be burned up after they come up. To date, I would recommend that the grower who sterilizes his tobacco bed with calcium cyanamid use only a O 14 7 commercial fertilizer.

WOMAN'S PAGE

Green Foods Are Essential; Supply Minerals Vitamins

by LAVANA TOWNSEND

Our grandmothers were not far wrong in their ideas that greens were the best of tonics. Of course, they had never heard that greens offered a good supply of minerals and vitamins, but they had learned from experience that when the green season came in, the family began to pick up in health and spirits. Nutrition specialists say a person should have at least one green or yellow vegetable a day.

Greens have a secure place in the diet, both for esthetic and for health reasons. They are especially important as a source of minerals and vitamins. Most of them have a liberal amount of the two minerals most often slighted—calcium and iron.

The greener the leafy vegetable, the higher is its iron and vitamin A content. The more blanched the leaf the poorer it is in these two dietary essentials. Turnip tops for instance are much more nutritious than head lettuce.

When the average person hears the word greens he usually things first of spinach. Spinach is a good leafy vegetable, but scientists say other greens are quite as good. Beet tops, chard, dandelion greens, mustard greens, turnip tops, and watercress are often richer than spinach both in calcium and in iron.

So if "Junior" or his father have developed an aversion for spinach there's no point to precipitating a family crisis, over it. There are plenty of equally good greens to which one can turn.

In shopping for any of the leafy vegetables, of course, you look for fresh. young, green, tender leaves. If leaves are very dirty, or are dry or yellow, or have coarse stems, you'll look for a better buy. Such leaves probably will not be palatable or nutritious and will mean considerable waste.

When you're buying lettuce you'll give the head a little hand press to find how firm it is. And you'll look for signs of tip-burn, the telltale brown edging the leaves, particularly in the innermost parts of the head. They would have to be trimmed off which means waste.

Occasionally you'll buy a head outwardly in prime condition. But as you prepare your leaves for a salad you find the nidribs or even some of the rest of the leaf streaked with red-brown. These red brown streakings don't make the leaf inedible—need not even be cut off the leaf unless they make the salad look too unattractive.

The red that develops on cut surfaces of lettuce is something else. If you cut a head across and put part of it back into the refrigerator to serve later, don't be too disturbed on returning to find that the cut edges have developed this reddish brown color. Actually there's nothing harmful about it. The juice in lettuce has a latex similar to that in the milkweed. And that latex turns a brown red when the air reaches it.

Methods of Serving

As to serving green vegetables, many of them can be eaten raw as well as cooked. And that goes for spinach as well as for the dandelions and cress. Those who have tasted spinach in any form except cooked, might try its tender leaves served just like lettuce or cress with a good salad dressing.

For the cooked greens many people like some of the nippy leaves mixed in with the milder ones. For instance field cress or dandelion or dock worked in with spinach. Sweet potato tops make a delicious dish of cooked greens.

Though even the most careful cooking results in some nutritive loss, much of the minerals and vitamins may be conserved. Heat is an enemy both of color and of vitamin C; so greens should be subjected to it for as short a time as possible. And since some of the mineral salts are easily dissolved in the water, the leaves should be cooked in only enough water to prevent scorching. with spinach, just the water that is left on the leaves after they are washed will be sufficient.

Plant acids are among the enemies of the green coloring matter of the leaves. Heat frees these acids, lets them attack the green and break down into ugly brown compounds. Some of the acids, however go off with the stems during the first moments of the cooking. But if a lid is on the kettle the acids in the stem just collect on the lid and drop back onto the leaves to attact the green coloring matter. So to keep the leaves as green as possible. cook them in an uncovered utensil.

Snip Off Stems

To cut down on cooking time and save more nutrients. it's a good idea to snip off the stems of spinach and discard them if they're tough. or if they're not, start them cooking before adding the leaves. With chard, you might use your kitchen scissors to advantage, cutting the midriff out and giving it a few minutes head start of the thinner part of the leaf.

To speed the cooking of broccoli, discard the woody ends, and split the stalks into lengthwise quarters so that each one will have a tuft of the buds.

If you add vinegar or lemon juice to your greens, do so after cooking them. It's that old feud between the acids and green coloring again. They soon turn the cheerful green of the leaves to a drab olive cast.

Butter gives a pleasing flavor to any dish of greens or bacon fat with bits of crisp bacon.

Whichever is your pet way of preparing greens, by all means get them into the menu somehow!

ICEBOX BREAD TORTE

6 slices dry bread
1 tablespoon butter
½ cup peach jam
2 teaspoons lemon juice
¼ cup orange juice
¼ cup chopped dates
¼ cup chopped nuts

Line refrigerator tray with waxed paper, leaving several inches extending past the top. Remove crusts from bread, and butter on one side. Line the bottom of the tray with one half of the bread, buttered side up. Heat jam thoroughly. Add fruit juice, dates and nuts. Pour one half of this sauce over the layer of bread. Place remaining slices of bread over first layer, butter side up, and cover with remaining sauce. Fold waxed paper over top of torte and apply pressure with fingers so that bread and sauce blend together. Chill for at least 4 hours. Serve with cream, whipped cream or ice cream.

Helpful Household Hints

If you do not happen to have a single-edge razor blade for ripping out stitches,take a strip of adheasive tape and fold over one edge of a doubleedge blade..

Purchaser of aerosol insecticides containing DDT should read labels on the containers before buying. Labels indicating that the aerosol was manufactured under a license issued by the Department of Agriculture are a guarantee of safety.

Experiments have proven that green celery is more nutritious than blanched celery.

Experienced homemakers say sort out the new cloth scraps to be used in quilt piecing. Sprinkle and roll up in a piece of cloth. After an hour, iron each piece carefully. make sure not to get it out of shape. The starch comes back to the material by this method and the blocks are easy to cut and sew.

When cutting a meringue covered pie use a sharp knife frequently dipped in cold water.

To loosen a glass stopper that is apt to stick, let a few drops of glycerin soak between stopper and neck of bottle.

If you wipe spots off the floor as they appear, it will not be necessary to wash the entire floor so often.

Tan or black shoe polish stains will usually come off upholstery if sponged lightly with a cloth dipped in carbon tetrachlorode.

A pail of water in a freshly painted room will help to remove the odor.

Canning Surplus Vegetables Urged in Lincoln County

Fayetteville, Tenn., July 13--(Special) Mrs. Ann W. Warren, regional director of the school lunch division of the State Department of Education, recently visited Lincoln County.

During her visit, she stressed the importance of canning all surplus vegetables and fruits to be used in school lunch rooms this winter. Dried beans, she said, will be very scarce since many will be shipped oveseas. Patrons of schools operating lunch rooms who have beans or other vegetables and fruits were urged to can these commodities and sell them for a reasonable amount to the lunch room.

During the 1945-46 school year, the U. S. government sent to Lincoln County $23,983 which was spent for designated foods. The equipment, cooks and other expenses including undesignated food were bought with money the children paid for lunches, which in no case exceeded 10 cents per plate. On this plate was a meat or meat substitute, two vegetables, bread, butter and milk. Any child who attended school and was known to be unable to pay for his lunch was permitted to eat without any distinction being made between paying and underprivileged children.

A lunch room operator should be sure of at least 10 cans of usuable food for each child enrolled if she is to be sure of a complete program this winter, Mrs. Warren said.

Burning of Dead Oak Leaves Helps Kill 'Blight' Pest

Burning of dead leaves will go a long way toward ending what seems to be a blight attacking oak trees, Dr. S. Marcovitch, entomologist of the U T Agricultural Experiment Station, declared today. Another hope is that parasites will do their work well this year.

The real cause of oak leaves turning brown now is not a blight or fungus, but an insect known as the white blotch oak leaf-miner, Marcovitch said. This insect, being small and flat, can live between the upper and lower surfaces of the leaf. It changes at maturity into a tiny moth or miller.

The chances are that these leaf miners will not be troublesome next year, if their parasites become numerous, Marcovitch stated. Many insects such as the fall webworm apear in cycles of 10 or 11 years. In time the parasites get the upper hand and then the insect almost disappears. The parasites do such a good job of destroying the pests that they themselves die or starve, causing the cycles of scarity and abundance.

The oak leaf miner passes the winter as a larva or worm within the dry leaves. It is advisable to rake and burn the leaves. If this is done systematically, good comtrol of this pest should be obtained. A spray of nicotine and soap might kill the pests but spraying is not practical in most cases. Reliance should be placed upon the parasites and burning of leaves.

LIME SNOW

1 envelope plain gelatin
¼ cup cold water
1 cup hot water
½ cup sugar
⅛ teaspoon salt
½ cup lime juice
3 egg whites

Soften gelatin in cold water and dissolve. with the sugar and salt, in hot water. Add lime juice, and cool. When mixture begins to thicken, beat with a rotary egg beater until fluffy. Fold in stiffly beaten egg whites. Place in a large dessert dish or in sherbet glasses and chill until firm. Just before serving, squeeze lime juice over top of desert. Garnish with slices of lime. Serves 6.

A custard sauce made with the egg yokes may be served with the dessert, if desired.

PLUM JAM

2⅛ cup prepared fruit
2½ cups sugar
4½ tablespoons powdered fruit pectin

To prepare the fruit, pit, but do not peel about 1¼ pounds of fully ripe plums. (Sour cherrystone plums give best color and flavor.)

Cut in small pieces and crush thoroughly. Add ¼ cup water; bring to a boil and simmer covered, for 5 minutes. Measure 2⅛ cups into a large saucepan. One-eight cup is 2 tablespoons.

Measure sugar and set aside. Place saucepan holding fruit over high heat. Add powdered fruit pectin (mix content of package thoroughly before measuring) and stir until mixture comes to a hard boil. Add sugar at once. Bring to a full rolling boil and boil hard 1 minute, stirring constantly. Remove from heat, skim, pour quickly into glasses. Paraffin at once. Makes about 4 six ounce glasses.

ORANGE GINGERALE SHERBET

1 envelope, unflavored gelatin
¼ cup cold water
½ cup orange juice
½ cup sugar
⅛ teaspoon salt
1 cup gingerale
¼ cup lemon juice
2 egg whites

Soften gelatin in cold water. Heat orange juice. Add softened gelatin, sugar, and salt, and stir until gelatin is dissolved. Cool, and add gingerale and lemon juice. Chill until firm. Beat with rotary beater until light and fluffy. Fold in the stiffly beaten egg whites. Pour into refrigerator trays and freeze to a mush. Whip mixture with a fork. Return to refrigerator and continue freezing. Serves 8.

Never grainy—
Never runny—

5 MINUTE CHOCOLATE FROSTING

2 squares (2 oz.) unsweetened chocolate
1 1-3 sup (15 oz. can) Eagle Brand Sweetened Condensed Milk
1 tablespoon water

Melt chocolate in top of double boiler. Add Eagle Brand Sweetened Condensed Milk and stir over rapidly boiling water 5 minutes until thick. Remove from heat. Add water. Cool.

Spread on cold cake. Makes enough frosting to cover tops of 2 (9 inch) layers, or top and sides of loaf cake or about 24 cup cakes.

Home Economist Discusses Use of Emergency Flour

by FRANCES AINSWORTH

Everyone I know is talking about the new Emergency Bread. Several of my friends have asked me why it is darker in color and how to use it for home baking—so I went to the best authority I know for information—the Miller's National Federation.

Of course, we all know that our government has asked us to use the new Emergency flour in order to send more wheat to the starving people of Europe. I was interested to learn that the new flour has 80 per cent of the grain extracted—8 per cent more than in regular white flour. This means that part of the outer husk of the wheat grain is now included in our flour—which accounts for the darker color.

I received several valuable hints from the Federation. And. . . after trying all my favorite recipes with the new flour, I'd like to pass these tips on to you.

When you are baking something leavened with baking powder or with sour milk, use the minimum amount of mixing or stirring after flour and liquid have been combined. I've found that with quick bread it's best to mix only until the flour is moistened. Another thing—its best to handle doughs very lightly when making a yeast-leavened product . . . and never let the dough rise more than double.

I've found that by following directions carefully I can make delicious pies, cakes and bread with the New Emergency flour. Try it yourself—you'll be delighted with the results! But remember, to get the light fluffy bread and pastries you've become accustomed to, only the regular white flour can give you those results.

MOLASSES SPICE COOKIES

1 1-3 cups (15 oz. can) Eagle Brand Sweetened condensed Milk.
½ cup molasses
¼ teaspoon ginger
½ teaspoon allspice
½ teaspoon cinnamon
½ teaspoon salt
2½ cups graham cracker crumbs
½ cup seedless raisins
½ cup chopped nut meats

Mix together Eagle Brand Sweetened Condensed Milk, molasses, spices, salt, graham cracker crumbs, raisins and nut meats. Drop by spoonfuls onto greased baking sheet

Bake in modcratc oven (350o F.) about 15 minutes. Remove from pan at once. Makes about 36.

The Byrd Nest

By Rev. Bernard O. Boyd
—Guest Columnist.

Today's Egg—WHAT HAPPENS TO THE FALLING STARS?

One among the outstanding beautiful things of nature is the heavenly constellation which greets men and women by night. There is but one regretful thing to be witnessed while watching the stars: it is to see a star shoot or fall. Throughcut the ages from Adam to this present generation, people have sat and watched the stars twinkle. Poems have been written about them, but it seems no poet finds much joy in seeing a star fall. The star is beautiful, and useful only when it is in place. We have commonly used the word star to describe persons who are outstanding in certain achievements. These stars also are beautiful and helpful only when in place. Nevertheless, from time to time, and throughout the ages, we have seen stars of humanity fall. Samson a star soldier, fell at Delilah's feet. David, a star of righteousness fell on his face before Bath-Sheba. Solomon, a star of wisdom, fell because of his many wives. We find no beauty, no inspiration in their falls.

It seems not to matter how high the star is as it twinkles, there is a possibility of its falling. Stars rise high. Men look up to them with delight, but despite the greatness of their height, we find that these human stars also can fall.

Contrast the effects of the star while in place and when it has fallen. While in place, it gives light. It with many other stars help men to find their way from place to place. They have brought much joy to people who found themselves lost from the roads or paths they traveled. When those stars fall, men lose the guidance the star had afforded. Again we find that if the falling star should strike the earth, it would do much damage to the place of its landing.

Stars of humanity should ever try to keep their lofty place among men, for in a fall they bring an end to their own careers, rob somebody of the guidance that is so much needed, and they do so much harm to the spots upon which they fall.

Despite the losses suffered by people who looked upon the star, when it falls, I feel that the star itself has lost most. It did help some one to find his way, it is true, but if that star falls, there is always another star to take its place. I have no doubt but that stars have been shooting since the days of Enoch and before his days also, but on a clear night, we look up, it seems that not a single star has fallen from its place. Even the human star must not feel that the world will suffer very greatly because of his fall. There is always another star ready to take the vacated place.

The star which shines is always remembered, but where there are so many other stars, the fallen star is soon forgotten. Were it not for the fact that history is recorded, many stars would be forgotten forever.

One puzzling thing about falling stars is, the people seldom learn where they land. As long as they shine we see them. We see them while they are falling, but soon they plunge out of sight in their fall. The question arises, "What happens to the falling stars? We seldom know. The only way to maintain permanent recognition is to keep on shining.

Purple Heart Veteran, James Banks, Hopes To Regain His Health

26 States Will Take Advantage of Federal Lunch Funds

Washington, Aug. 13, 1946—The USDA announced today that 26 states and the territory of Hawaii have already signed agreements to take advantage of Federal school lunch program funds provided under the National School Lunch Act.

During past years, the School Lunch program has been run on a year to year basis. The new Act, signed by President Truman on June 14, makes the program permanent and increases the responsibilities of States in the administrative field. Under the provisions of the Act, which is designed to safeguard the health and well being of the nation's children and to encourage local use of abundant farm crops, States must agree to match federal allocations with funds from sources within the States, and must designate agencies to administer the aid in order to receive their share of available funds.

Local contributions of funds, labor, and equipment are credited to the States as a part of the matching funds. In many States, the value of such expenditures in the past would have been more than sufficient to obtain the presently available federal funds. Under such circumstances, the only direct cost to a State would arise from administrative expenditures by the State agency selected to handle the program.

The National School Lunch Act also provides that nutrition standards in effect under last year's program shall be continued. Children unable to afford the lunches will be served at reduced prices or free of charge. No type of discrimination shall be made against any participants. The law also requires that the whole program be on a non profit basis in accordance with past procedure.

Money for the purchase of lunchroom equipment will be made available to the States under the new law; allocation of such funds to individual schools will be made by the administrative agencies running the program for the States.

Allocation of federal funds by the new law is established by a formula based on school-age child population and State per-capita income in such a manner that States in the greatest need of assistance in maintaining proper child nutrition will receive the

Early Winter Onion Planting Will Insure Better Yield

By DR. FLOYD BRALLIAR,
Garden Editor

This is the time to plant winter onions for best results. We are fully aware that they may be planted for a month or six weeks yet but the later they are planted the fewer green onions you will have this winter.

Onions do best in very rich soil, so when planting your onions fertilize heavily with stable manure if you can get it, or if this cannot be had, use a combination of any good organic fertilizer mixed with a commercial fertilizer. With a fertilizer on the top of the soil, turn it under about five or six inches deep.

If your soil is already rich, you will need no other preparation, but if it is poor, cover the surface of the ground that has been turned about three quarters of an inch deep with well decayed stable manure, or if this is not available scatter evenly a good commercial fertilizer at the rate of a quart cup level full to every square rod of surface. Now rake your soil

Farm Output Is Expected To Top Previous Records

Washington,—(UP)—An Agriculture Department spokesman said today there is a good chance 1946 farm production will top record-breaking levels predicted by the department's crop reporting service.

The crop board said that if present prospects are borne out, farm production this year will be about 27 per cent above the 1923-32 average and three per cent above 1942—the previous banner production year.

Both corn and wheat are expected to hit new highs. Wheat production was estimated at 1,160,000,000 bushels and corn at 3,496,280,000 bushels. The previous highs were 1,123,000,000 bushels of wheat in 1945, and 3,302,000,000 bushels of corn in 1944.

The department spokesman pointed out, however, that the board's predictions consistently have been conservative. Over a 10-year period, he noted, the corn crop has averaged 5.57 per cent larger than the board's August 1 prediction.

If this year's prediction is low

Was With 578th Field Artillery of 3rd Army When Wounded

Washington, D., C. — James Banks, Negro World War II Purple Heart veteran, came home to the 80 acre farm owned by his mother on Route No. 1, Goshen, Pike County, Alabama, last November, but there is a question in his mind as to whether he shall ever be able to do much farming.

Early in 1946 he rented 38 acres, 8 of which are owned by his mother, and obtained a rehabilitation loan of $423 from the Farm Security Administration to purchase a mule, feed, fertilizer, a peanut weeder and 50 baby chicks. He immediately set about razing an old house across the road from his mother's home and building a dwelling for himself, his wife, and two-year old Margaret Lee Banks.

He plans to plant 20 acres in peanuts for market, 4 acres in peanuts for hogs, 10 acres in corn, and 3 acres in truck crops.

"I hope to stay around here and do what little farming I can," he said. "There isn't anything much else that I can do. When I first started I was able to plow three days. Then I had to stop. My back wouldn't let me do it. So I had to hire a boy to help me.

"You know, I thought that I could farm like I always did. I wanted to buy me a small place if I could find one, but I don't know whether I'll ever be able to farm like I used to do."

Banks entered the Army in February 1942. He received training at Fort Brag, North Carolina. He saw action in Africa, southern France and in Germany. It was in Germany that a jeep he was driving struck a land mine. He was unconscious about 12 hours and was injured in the back and hip. He was hospitalized for some time and then went back into action. He receives $11.50 a month for disability pay. He was in the 578th Field Artillery of the Third Army and later of the Seventh Army.

Price Administrator Paul A. Porter Recently Made This Statement:

Reports have been circulating in business circles and even in the press that the Office of Price Administration will prevent adjustments by requiring to jump through hoops of red tape. The time has arrived when such stories must be vigorously denied and the facts presented.

These misunderstandings may have arisen partly because we opposed some amendments to the Price Control Act under which we are now operating while the matter was up for debate. However, the Bill is now on the statute books. The decision has been made. We accept it.

The OPA is determined to follow both the letter and the spirit of the law. This agency has now settled down and is going full-steam ahead to carry out the provisions of the Act. Our price people have been given orders to use every means possible to expedite the granting of legal price adjustments. If production is showed up, it will certainly not be the fault of the OPA. We will grant all price increases called for by the law. We will withhold those which cannot be clearly justified under the standards set up according to the law.

We subscribe fully to Congress' statement in the preamble of the Price Control Act that "adequate prices are necessary stimulants to production," and also to the statement that we need price control "for the prevention of inflation and for the achievement of a reasonable stability in the general level of prices and rents, cost of living and costs of production."

The OPA will continue of its own accord to make prompt price adjustments under the general

(Continued On Page 2 Col. 2)

26 States Will Take

(Continued From Page 1)

greater proportionate share of the Congressional appropriation.

Department of Agriculture officials expect that all States that have not yet signed agreements under the Act will make every effort to do so before the opening of the fall school term, in order to qualify for the benefits under the program.

The following States and the territory of Hawaii are now participating:

Alabama, Arkansas, Florida, Georgia, Illinois, Kansas, Kentucky, Louisiana, Maryland, Michigan, Minnesota, Mississippi, Montana, New Jersey, New York, N. Carolina, Oklahoma, Rhode Island, S. Carolina, South Dakota, Tennessee, Texas, Utah, West Virginia, Wisconsin, Wyoming.

Early Winter Onion

(Continued From Page 1)

down evenly, and smooth, and you are ready to set your onions.

There are three varities of winter onions in common use. White multipliers, yellow potato multipliers, and the Egyptian shallot, but most people prefer the shallot to either of the other onions.

Plant the shallot sets three or four inches apart, in rows a foot or more apart. Plant them just as you would plant onion sets in the spring time. They should make good green onions for pulling all winter and spring.

The multiplier onions are decidedly different from this in their method of growing. Plant small sets this fall if you wish to have large onions next summer. Plant large onions now if you wish to have plenty of green onions next spring. For every large onion you plant will split up into a "nest" of small onions that had better be pulled and used as green onions this winter or early spring, or allowed to mature into a number of small sets for next year's planting.

Farm Output

(Continued from page 1)

by the same percentage, the corn crop may average nearer 3,671,000,000 bushels than the estimated 3,496,280,000.

Agriculture experts attributed the difference between the department's estimates and actual production to two factors—the increased use of hybrid corn and generally favorably August growing weather.

"If August weather is good this year—and so far it has been—the estimates may be exceeded again," the spokesman believed.

Meanwhile, it was pointed out that the new increases in the prospective wheat crop may make it possible to lift restrictions on the use of wheat, except in the case of distillers and feed millers.

Continuing wheat restrictions on those two groups would not matter too much, officials said, because they can use corn just as well, if not better, than wheat.

Lifting of other wheat restrictions would mean a return to whiter bread, normal-sized loaves and more flour, bread, cereals and pastries. Millers now are limited to 87 per cent of last year's flour production.

In addition to wheat and corn, production of oats, rice, cotton, clover and timothy hay, dry beans, sweet potatoes, tobacco, sugar cane, sugar bets, broomcorn and hops are expected to increase over last year.

Decreases are anticipated in production of barley, rye, buckwheat, flaxseed, grain sorghums, tame hay, wild hay, alfalfa hay, dry peas, soybeans, cowpeas, peanuts and potatoes. But many of those crops wil show only slight drops.

The greatly increased supplies of corn and wheat also will mean more livestock feed which, in turn, will mean more wheat, poultry, eggs and dairy products.

Price Administrator

(Continued From Page 1)

earnings standards which are still authorized under the law. This means, for instance, that when an industry's earnings fall below the minimum set forth in the law (normal peacetime earnings of an industry) price increases will be allowed. OPA will also remove price controls from non agricultural commodities which are not important to business or living costs and when supply and demand have come into balance, as required by the new statute.

Supplementary Pricing Standards

An additional set of pricing standards has also been provided for producing, manufacturing and processing industries under the new law. Because there has been considerable misunderstanding over the application of these manufacturer pricing standards, I want to discuss them at some length.

The law clearly defines the standards by which price adjustments are to be granted. Those standards will be the rule by which we will grant adjustments.

It is important for those who have come forward with glib suggestions for a free-and easy method of granting increases, to examine the law. OPA is not a free agent. Cost data must be supplied by industry, then analyzed by OPA. It would be as illegal for us to grant price increases as the result of collective bargaining as it would be for us to roll prices back as the result of states specifically that industry advisory committees must provide cost and price figures to OPA, and that increases can be granted only after such data have been made available.

Because there is so much misunderstanding on this point, it would be well to examine the law, which reads: "Any industry advisory committee may apply to the Administrator for the adjustment of the maximum prices applicable to any product in accordance with the standards set forth in this section, and SHALL PRESENT WITH THE APPLICATION COMPREHENSIVE EVIDENCE WITH RESPECT TO COSTS AND PRICES."

Obviously, you can't reach into a hat and pull out cost data for an entire industry. Such information can come only from industry itself. It won't be easy, I know, for industry to provide this information, but the law requires it and OPA must have it in order to grant legal adjustments. After comprehensive figures come in they will be carefully analyzed and legal adjustments granted as speedily as possible. Though the law gives a limit of 60 days, I am certain that if industry provides all necessary information, in a large number of cases results will be available before the 60-day deadline. However, businessmen themselves know that analysis of cost data is not a sleight-of-hand trick—it is a job that takes careful, methodical calculation.

There can be no doubt that it will be difficult for some industries to collect the statistical material necessary. Congress recognized that OPA, on its own, could not assemble data for each industry rapidly enough to do an effective job. Therefore, it wisely placed a major share of this responsibility upon industry itself. Some industries may find that their books have not been set up properly to obtain the necessary breakdowns—some may find it necessary to hire additional accounting personnel.

We are determined to grant adjustments on a businesslike basis, and urge industry to present complete information when asking for adjustments. We do not intend to engage in collective bargaining. We intend to grant adjustments which will be based on the formula provided by Congress. That is, maximum prices wil be established on the basis of the industry-wide 1940 average price of a product plus the industry-wide average cost increases since then. This formula is subject to limitations: (1) if the current price covers the total current costs plus the industry's overall 1940 percentage ratio of profit to sales, no further increase would be required; or, (2) if the industry cannot show that a substantial increase in production is practicable without reducing the output of another equally needed product, then the law does not require that an adjustment be given provided the product is realizing a REASONABLE profit.

We are well aware of the fact that industry is worried about the words "reasonable profit" which were written into the Act of Congress. Our staff has been working overtime drawing up definitions which will clarify such phrases and spell out the procedures which must be followed by industry to obtain relief. These procedural regulations not only will outline methods of obtaining price adjustments, but set well up standards for relief; explain what is meant by "substantial increase in production' 'and "reasonable profit;" set up a definition for "representative sample;" and list in detail the kinds of data required and how they should be presented. Every effort has been made to draw up these procedural regulations so that they will be easily understood. Obviously, however, it is a complicated matter and not as simple as A, B, C. One thing must be pointed out—the law does not give OPA any real leeway and the procedural regulations are drawn up to conform with the statute.

If industry believes that the accumulation and presentation of cost data will be a headache, let me assure industry that it will be as difficult for us to analyze the information as it was for industry to present it. However, the OPA and the industry and the American public have a common stake—that is production. Everyone realizes that production is the most effective means of preventing a wild inflation. Uncontrolled inflation is, in the long run, as disastrous for industry as for consumers and the nation as a whole.

Some industrialists may want to hold back production until price adjustments have been granted. This is a shortsighted point of view that can be proven on two practical grounds: (1) many industries will probably find that their costs figures will allow only moderate price increases. Holding back will in the long run be more costly to them than getting under production with a knowledge that necessary, justified increases will be granted in short order; (2) price control has only one year to run and the law provides that products shall be decontrolled as rapidly as supply approaches demand. The sooner manufacturers get into full production, the sooner they will reach the stage where all controls can be removed. Immediate production means immediate money in the bank, a high level of employment, and the approach of decontrol.

Steel Supports American Industry

For a great many years, the basic barometer of industry production has been steel output. The reason for that is simple. Steel is essential to the operation of almost every industry, farm and home.

Steel makes our motorcars. Steel goes into our kitchens in great quantities. Steel products package the food we eat. Steel builds our trains and planes and ships and buses. Steel is indispensable on the farm. Even the most primitive form of transportation, walking, involves steel— in the form of the nails in our shoes!

Some time back there was talk to the effect that steel's dominant place in our industrial life might lessen, due to the development of new, competitive materials. It is true that great progress has been made with other metals and with plastics. They have found an important place in our industrial picture. But we still need steel more than ever for countless new uses.

During the steel strike, America's industrial machine moved inexorably to a virtual stop. The effects of the strike are still being felt, in the form of shortages of steel products. For this is the vast industry, basic in every sense of the word, on which all other industry depends.

Government Spending and Your Dollar

Of all the issues which will face the next Congress, none will be more important than that of a balanced budget. Continued deficit spending, with the war over and the country undergoing a boom period, is the greatest threat to the value of the dollar, the savings of the people, and the future stability of the nation.

In depression times, the advocates of free spending enthusiastically backed the John Maynard Keynes theory, which, to put it simply, is that government must go in the red and prime the pump when conditions are bad. Now the same group seems to have forgotten the logical development of that theory—which is that in good times government must retrench, spend less than it receives, and build up some economic fat for lean years to come.

A sound fiscal policy now must have three progressive phases. First, the budget must be balanced. Second, there must be an orderly program for reducing and eventually liquidating the public debt. Third, when sufficient progress has been made along the first two phases, taxes on industry and individuals must be gradually reduced.

This is a long-term program. Its results will only be apparent over decades. But it must be the backbone of any fiscal policy which will spare us from government-induced inflation, the struction of insurance values, the collapse of the currency, and the kind of general economic collapse we are witnessing in Central Europe, China and elsewhere.

The Problem of Medical Care

The problem of extending and improving medical care for the American people breaks down into two phases. First, we must avoid the ruinous mistake of subjecting the doctor to political dictation which would destroy much of his initiative and lead inevitably to a decline in medical progress. Second, we must find some means of financing it which will not impose an excessive burden on people who are already bowed and staggering under the vast weight of social security taxes, income taxes, property taxes and many other governmental drains on their income.

The pending Murray-Wagner-Dingell health bill fails on both these counts. It would create an enormous bureaucracy with sweeping, centralized powers over doctors, clinics and hospitals. It would impose a heavy tax on all workers and employers, thus still farther reducing "take home" pay. And the revenue thus derived would in all likelihood be insufficient, making it necessary to subsidize the measure from the strained Federal treasury.

The best solution thus far offered for the medical care problem is the voluntary group medicine plan, under which families, in effect, insure themselves against sickness. If illness or accident occurs, they are treated by doctors of their own choice—not politically appointed doctors. They receive hospital and clinical attention when needed.

In addition, rural areas, of their own volition, are experimenting with other ideas. Out of such efforts, progress is made. And the fact remains that the American people already have the highest standards of medical care in the world— including those countries where medicine has been socialized and regimented for years.

A fiery-tempered business man wrote the following letter:

"Sir: My secretary, being a lady, cannot type what I think about you. I, being a gentleman, cannot say it. You, being neither, will understand what I mean."

Fair Wages for the Iron Horse

The American railroads, now operating with the same level of freight rates they obtained in 1940, are faced with staggering increases in wages and material costs. That is the essence of a vast amount of factual information provided by the railroads in support of their application for increased rates which is now before the Interstate Commerce Commission.

The testimony of one major line is typical. According to a top executive, a dollar buys a third less labor now than it did in 1940. Fuel costs over 62 per cent more; cross ties cost 127 per cent more, and steel rail costs 22 per cent more. So it goes, all along the line. And in addition to cost increases, some of the abnormally favorable factors of operation that existed in wartime are disappearing. For example, average tonage per car is on the decline. Turn around time for freight cars is increasing, which simply means that the line in question will have to provide more equipment to handle the same load. What this all adds up to is that this railroad will fall short of earning its fixed charges by about $16,000,000 this year. And most of the other major lines are in exactly the same boat.

The only solution is substantial freight rate increases consistent with the economic conditions under which the railroads must operate today. They have gone the absolute limit in reducing the cost of operation. Their standards of efficiency and economy are of the highest. If they are to continue to serve the country, they must receive more for their work.

Jobs and Wages

Labor has received enormous gains in the form of wage increases, reduced hours of work, welfare funds, and so on. Even so, there are rumors of new labor drives to obtain still greater benefits. There is talk of more strikes in basic industry, which would stifle production and thus contribute to greater inflation.

What labor should realize is that destruction of industry— and policies which unreasonably increase the operating cost of industry—will destroy labor's gains. An excellent example of this is the coal industry. To quote Coal Age, "Coal will have to be minded because the country cannot do without it. That alone should assure good business—although not necessarily profitable prices—for at least a year or two more. But the increased casts imposed on the industry . . . . plus the production interruptions that have kept the users of coal in a lather since the war started, favor a competitive upsurge that can cost coal a great deal of business and miners a great deal of earnings unless prompt steps are taken in the direction of less interference with management, fewer production stoppages and higher efficiency. Coal now is definitely on the danger line—if not over it . . . ."

If coal costs eventually go too high, industrial users will find a cheaper power substitute. And then the tens of thousands of jobs coal mining provides will disappear.

Labor wants good pay. And labor also wants an abundance of jobs. These are legitimate goals. But when labor demands too much it starts a process which can destroy the very source of its livelihood. This is simply one more example of the fact that you can't have your cake and eat it too.

State's Wheat Goal Set

Washington, Aug. 15—(Special)—Tennessee's wheat goal for 1947 is 475,000 acres, the Agriculture Department announced today.

This year about 419,000 acres were planted in wheat.

Health Is not a Commodity

The Citizens Medical Refcrence Bureau in a recent report declared that compulsory health insurance would result in medical control of the individual by the government.

"The practice of the healing art is not a commodity which can be bottled up at a fixed price per person," the report states. "What is meat to one person is poison to another. . . .

"Any attempt by the government to establish and maintain a monopoly of the healing art by compelling all wage earners to contribute to the support of such a monopoly must inevitably stifle progress and foster a mediocre type of treatment. . . .

"The labor difficulties experienced during the past year and the food crisis at home and abroad serve as a reminder that the Federal government has its hands full to handle its own problems without endeavoring to take over the personal problems of the states and the individuals in the respective states."

It is possible to extend Federal assistance to the state in such matters as tuberculosis and venereal disease control and child welfare without establishing a medical dictatorship in the process. The very great progress made in voluntary health insurance on recent years point to the solution of medical care problems in the nation.

Big Returns Reported From Ladino Clover

From an investment of $85 in seeding 10 acres to barley and ladino clover, J. E. Burcham of Hickman County, Kentucky, sold $2,400 worth of clover seed in addition to grazing cattle and hogs. County Agent Warren Thompson announced today.

The field was seeded in October of last year with one and a half bushels of Missouri beardless barley and three pounds of ladino clover seed to the acre.

On March 15 Burcham turned into the field 83 hogs averaging about 100 pounds and 54 cattle averaging about 650 pounds. For six weeks the cattle received no other feed; the hogs were given some corn. The barley was grazed completely down and the clover was only about two inches high when the stock was removed.

The first week in July, 1,600 pounds of recleaned ladina clover seed were harvested, selling for $1.50 a pound, and there is a possibility that a second seed crop may be produced.

Justice for Industry

The people of the United States have suffered untold millions of dollars in damage from automobile strikes, coal strikes, steel strikes, railroad strikes, and smaller strikes too numcrous to mention. The technique of the modern strike organixer is to make his demands, set a deadline, eall a strike, and force an arbitrary settlement.

Fortunately for the public, industry does not follow the same process in seeking rate or price inereases. But it cannot prevent the inconvenience or damage suffered by the public as the result of dilatory practiees by public authorities in granting relief which is necessary to render efficient public service.

Today we are seeing the months drag by while regulatory authorities consider rate increases asked by the railroads to meet the tremendous rise in wages and costs of materials which they must now bear. During the war they did a magnificent hauling job. Because of the shortage of material for war purposes, they were denied almost all new equipment while they wore out their rolling stock and engines in war work. Now that their expense is up a billion dollars a year, while their income is going down, they are kept hanging in the air on a rate increase made necessary by conditions which have affected every other industry. As a result they are delayed in their ability to procure needed new equipment. According to W. C. Kendall of the Association of American Railroads' car-service division, the boxcar supply is "tighter than for any period during the past 25 years."

For a variety of reasons the railroads are unable to handle the same volume of freight per car, in many cases, as during the war. Strict wartime orders for maximum loading and minimum turn-around time no longer obtain. Manufacturers, anxious to move stuff quickly, don't wait until they have full carloads. Work weeks are shorter and cars frequently lie unloaded over the week end. Nevertheless, the roads are still making records in handling the traffie.

Is it not possible for a government agency which is responsible for the regulation of an industry such as the railroads, to get quicker action on rate questions which are causing confusion and loss to the railroads Or has it become the established government policy to hold industry up for months and years over such questions while government agencies settle labor demands which rates and prices, on the barrelhead?

Dams in the Missouri Valley

The farmers of this country should take a long and critical look at the proposal to build an enormously costly series of "flood control" dams in the Missouri Valley, the Southwest, the Columbia Basin, and elsewhere.

These projects would be similar to those built by the TVA. And, according to Representative Whittington of Missippi, "It is a fallacy to assert that TVA has proteeted the Tennessee Valley from floods. The TVA has put in the bottoms of reservoirs substantially all of the lands that were subject to overflow. . . . .The flood problem of the Tennessee Valley has been eliminated by submerging its valleys."

Some interesting comment has been made on the projected reservoirs for the Missouri Valley. According to the Missouri Farmers Association, these would inundate 90,000 acres of fertile land with an annual productivity of $18,000,000—more than twice the estimated annual loss from damage in that region. And a representative of the Jefferson County, Missouri, Farm Bureau recently, said one proposed dam would flood 18,000 acres to protect 9,000 acres!

Professor W. C. Etheridge of the Missouri College of Agriculture said: "I am convinced that the system of dams now proposed for Missouri would damage our bottom lands out of all proportion to the benefits the dam might develop in the control of floods."

Volumes of evidence to this effect could be cited. The truth is most of the proponents of a billion-odd dollar dam program arn't interested in flood control. They are primarily interested in socializing our electric power industry, as in Russia. Every flood control project so far approved, such as TVA, has proven itself to be primarily a power project. And every one has worked to the destruction of taxpaying, free enterprisc.

Fires That Never Happened

Organized fire prevention work by cooperation of civilian fire protection engineers and the armed services during the war materially held down fire losscs in military establishments and war plants.

When losses in World Wars 1 and 2 are compared with total values, the rate of fire loss in World War 2 is 40 per cent less than in World War 1. Experience and preparedness in the fire insurance business helps save hundreds of millions of dollars in property for use against the nation's enemies.

Immediatcly after war started in Europe in 1939, the National Board of Fire Underwriters passed a resolution placing all its engineering, inspection and other services and facilities at the disposal of the government for the duration of the emergency, just as it had in World War 1.

The armed services utilized the servicc of the civilian fire protection engineers in countless ways in instructing classes of Army and Navy officers, studying the effects of experimental bombs as well as the results of active bombing, and in consultation with bomber commands.

The work reached virtually every phase of the nation's armament and military program, including shipyards and navy yards. As training camps were hurriedly built, engineers drew plans for fire protection. Projects were inspected, fire engines and fire boats tested, standards for automatie alarms developed, water supply tables worked out, and new fire fighters trained.

All these services, involving the work of hundreds of fire prevention engineers, and thousands of manhours, were given without cost to the government.

Electricity for Agriculture

The Prize Awards Committee of the Edison Electric Institute has announced the resumption of the Thomas W. Martin Rural Electrification Award, which was suspended during the war years. It will again be presented annually to the electric operating company which makes the greatest contribution to the progress of rural electrification and agricultural advancement.

It is particularly fitting that this award should be resumed at this time. For the electric utilities of the nation are inaugurating a rural electrification program of record scope. Utilities in all parts of the country are involved. An idea of magnitude is found in the fact that all agencies concerned with rural electrication continue their present growth, the job of connecting farmers to electric lines is expected to be almost completed by the end of 1948.

The utilities do not stop with building power lines to serve the farmer. They are equally interested in helping him apply his power to farm tasks as efficiently as possible. With labor costs increasing, the farmer must rely more on machinery to get his work done. So the utilities are cooperating with state universities and other agencies in developing new and better methods of power utilization in agricultural pursuits.

Those who believe that the federally-subsidized Rural Electrification Administration pioneered rural electrification may be surprised to learn that about two thirds of the nation's 3,000,000 electrified farms are served by privately operated utilities. And these same taxpaying, business-managed utilities are the leaders in the campaign to extend power to the other 3,000,000 farms which don't yet have it.

A pedestrian is a man with a wife, two sons, three daughters and one automobile.

Heroine in Blue

by DORIS A. FLOOD

I think the little story of the heroine in bluc should be told for her valor may servc to lift hearts heavy with burdens and hardships.

In the beginning she seemed to us just another blue jay mother, perhaps tamer than the rest, because she never took to that nervous flight at our approach which is so characteristic of her family. This was more remarkable since she was accompanied by her three children, yet fearcd neither for herself nor for them. She would perch nonchalantly on the wire fence, only a few yards from the porch where we sat, with her children distributed carefully around her to share the crumbs she had obtained from the feeding ground nearby.

It was on one of these occasions that I first noticed with what difficulty she maintained her balance, and looking very closely, I saw that she had but one leg.

Oh, what a lesson to the faint-hearted! In a world peopled overabundantly with natural enemies and not overly furnished with the needs of life, this little lady had not only managed to survive herself, but had raised a fine family of three.

She managed them extraordinarily well, too, and not one of the little ones would crowd for his meal nor stir from the spot she had appointed when she flew off on urgent business. Indeed, it seemed as though her unusual strength of will had communicated itself to them and won whole-hcarted respect, even beyond the normal code of birdland.

She was not without her winning ways, either as her special ruse the lining up of her three, direetly in front of our eyes, the minute we appeared on the pourch, so that crumbs would be forthcoming. If buried in a book, we could count on plaintive calls to rouse us, too. When returning after a day's absence, we would find the family perched suggestively on the tree at the kitchen window. Who eould deny that she was the ever-watchful sentinel of our comings and goings?

The little story ends here. The children, of course, reached independence as the summer advanced, and the mother appeared alone. Gradually her appearances became less frequent and her motions more labored. Then she appeared no more. It seemed as though, having done her highest duty, she had earned her everlasting repose.

The Super State

During the war, we accepted an enormous extension of the powers of government into every phase of our national life, on the grounds that it was essential to the achievement of maximum war effort.

Now, with the war over by a year, we seem to still accept super-government, despite the obvious fact that, in principle, super-government was the main thing we were fighting the war against.

Under the fascist system, government owns or absolutely controls all the main productive resources of the country. And here in the United States, government is moving toward that end.

One example of that is the elcctric industry. The campaign to destroy the utilities through socialization began in earnest with the great TVA system. It moved on into the field of rural electrification. Now many influential public officials are advocating other great regional systems which would rapid ly make private power development and operation a thing of the past. And this is being done in spite of the fact that the privatc industry is completely capable of supplying our power needs, and that it supplied more than 80 per cent of the power used by all war industry, and that its record of redueing cost while paying enormous taxes is unexcelled.

There can be such things as limiting government domination to one or a few industries. If the trend is permitted to continue, it must inevitably end only when all industry is the creature of government. The super-state is the ultimate in monoply. It eannot exist save,through dictation. It can never brook competition. And, sooner or later, it abolishes the right of dissent—precisely as was done in Germany, Italy and Japan.

We must make the decision. We will have either free government or dictatorial government. And no halfway measures are possible.

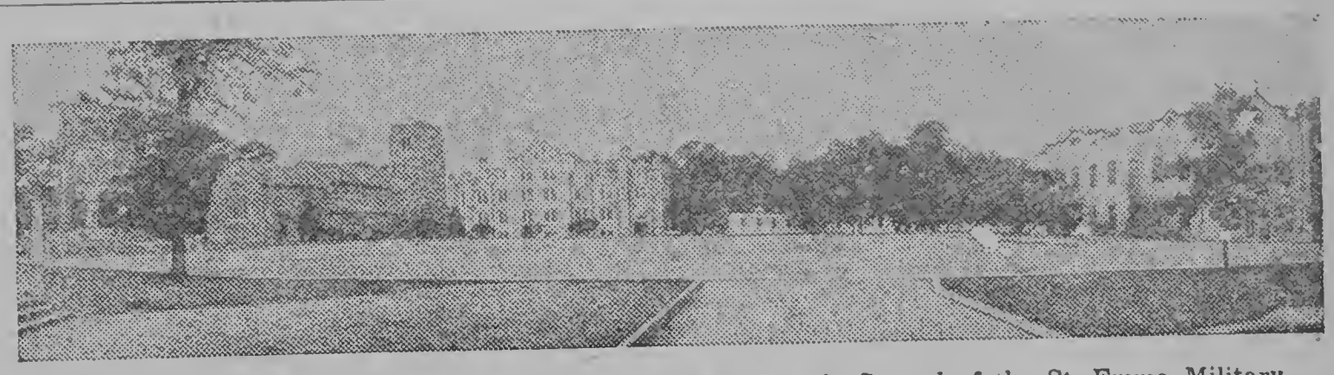
Retailers of Tomorrow

Addressing a Retailer-Veterans Conference, Gordon K. Creighton of the National Retail Dry Goods Association said: "Retailing's future will be built by the merchants who are able to bring the new abundance most effectively to an eager publie, and among these will be many of thc unknowns of today as enterprise and initiative have made many of the unknowns of twenty-five years ago into the outstanding retailers of 1946.

"Chief among these unknowns are you veterans who would already have had four or five years progress in retailing to your credit, if it had not been your business to win the war first. But history is on your side. Many of the successful merchants of tomorrow are in your ranks and these veterans will display the same dogged determination to win in business as they won in war. These are the men who will faithfully follow their commission as purchasing agents of the public."

The veteran who starts in retailing today does so at a time when the industry is putting forth maximum efforts to serve the public. Thc country is faced with a long list of critical shortages, and retailers are trying to make limitcd supplies go as far as possible. With the drastie change in price control, retailing in general and chain store systems in particular are doing yeoman service in protecting the consumers' poeketbooks by holding unavoidable priee increases to the minimum consistent with rising costs.

Retailers are aiding veterans through organized conferences in which experts discuss and instruct the ex-soldier in retailing as a career. This serves the veteran by showing him the mistakes he must avoid if he is to succeed—and it serves the public by assuring a "new erop" of retailers who will be well trained in their complicated craft.



ROCK CASTLE, VIRGINIA. Within a few weeks, the Parade Ground of the St. Emma Military Academy will become the center of Cadet activities, as both old and new students assemble for the Fall term at this boarding high school on the James River near Richmond. The U. S. Army will continue the Junior R.O.T.C., and all Cadets will follow a course in the Agricultural School or a trade in the Vocational School in addition to their high school academic studies. Many activities and courses curtailed during the war are being resumed. A Cadet Band will be organized, and student participation in outdoor and indoor sports encouraged

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.

Giles A. Hubert _____Editor
Sadie Wilson _____ Secretary
Henry Allen Boyd_____ Publisher
Office, 403 Charlotte Avenue.

Devoted to the interests of the Farmer, Truck Gardner, Livestock and Poultry, Breeder, the Home and the People.

Entered as Second Class Matter, April 10, 1929, at the Post Office at Nashville, Tenn., under act of March 3, 1879.

All contributions for publication in the Modern Farmer, should be addressed to The Modern Farmer, 403 Charlotte Avenue, Nashville 3, Tenn.

No libelous matter will be published. Unsigned articles or letters, and those written on both sides of the paper will not be used.

Subscription price $1.00 per year, 75c for six months, payable in advance. Personal checks must be certified. Make all checks or money orders payable to The Modern Farmer.

Advertising rates and sworn circulation figures presented upon application.

Plan Now

To seed small grain, rye grass or some type of winter legumes on al land that was devoted to row crops during the summer.

To see the new Extension Service film, "Dairying in Tennessee," at your earliest opportunity.

To store each piece of farm machinery, in a dry place, as you finish with it for the year.

To grow some type of greens in the family garden during the fall and winter.

To plant alfalfa before September 20, if possible. But don't sow the expensive seed on an improperly prepared seed bed.

To help decrease the number of costly forest fires that invariably come with fall.

To increase milk profits and decrease soil erosion through fall seeding of small grain and winter legumes.

No Alternative

Conditions confronting the railroads constitute the strongest showing that the proposed increases in freight rates should be made effeetive immediately. There is nothing speculative about the fact that traffic is declining rapidly or that wage rates and prices of materials and supplies have increased tremendously while freight rates remain at prewar levels.

Railroads did not want to ask for an advance in freight rates but they had no alternative if they are to remain in a solvent condition.

Alabama Cotton, Corn Damaged by Drought

Athens, Ala., Sept. 9—(Special)—The long dry spell has greatly damaged both cotton and corn in Limestone County, and local experts predict at least a 25 per cent shortage in the crops.

It was too dry for early corn to mature, and late corn is small and immature, while upland cotton has suffered badly. However, cotton planted on bottom land is not badly affected.

Fall Crop of English Peas Possible if Planted Now

By DR. FLOYD BRALLIAR
Garden Editor

Many people do not know that it is possible to grow a fall crop of English peas in the vicinity of Nashville. But every year for some time a few more people have been planting these peas than planted the year before. If you are especially fond of these peas we recommend that you give them a trial.

The early varieties of peas require only about 65 days to mature. Possibly it would have been better to have planted these peas last week, but they are very hardy to cold and do much better when it is cool than when it is warm.

Plant your peas exactly the way you would in the spring, using only the very early varieties such as Alaska, Blue Bantum, or Laxton's Progress. Laxtonian is just as good as Laxton's Progress for this purpose. In order to get the seed up promptly, soak them in water until the first sprouts begin to break through the seed, then plant them at once. In soaking any seed the water should be poured off every 12 or 14 hours and new water put on. This supplies the seed with plenty of oxygen to promote growth and to prevent seeds from rotting.

It is well to distribute a little commercial fertilizer under the rows of peas. Make the trench about four inches deep and scatter the fertilizer at the rate of one quart (two pounds to every 100 feet) and cover it an inch and a half or two inches deep with soil. Now plant your seeds and cover them over, leaving the ground level. Planted in this way the seeds should be up in three or four days. Give thorough cultivation.

Vetch Considered Valuable Legume for Cotton Land

Veteh and Austrian winter peas are among the valuable legumes which should be considered for much of the half million acres of cotton land ordinarily left bare through the winter, H. W. Welhausen, Extension agronomist, U T College of Agriculture, said today.

These legumes have been found particularly adaptable on eotton land that is frequently cropped in eorn or cotton. Peas and vetch can be produced on land with lower fertility, and on land with less moisture holding capacity than is necessary for crimson clover.

When seeded in cotton rows after the first or second picking, it is recommended that 20 to 30 pounds of vetch and 45 to 90 pounds of Austrian peas be seeded. However since the supply of vetch is limited, it is recommended that small grains, oats, rye, or barley, be mixed with vetch and peas. This will reduce the amount of peas and vetch seed required to give ground cover.

Inoculation of peas and vetch is necessary for good stands; otherwise the seed is likely to be wasted. Each of these crops requires phosphate, and the seed should be recovered from one to two inches.

Seedings should be made by the middle of September for such combinations, although winter peas alone can be seeded as late as the middle of October.

Further information on recommended cover crop combinations and seeding eonditions can be obtained from county agents.

Man Couldn't Pull Hybrid Corn Stalk

The inability of a man to pull up a stalk of hybrid corn attracted attention at a recent meeting at the farm of John D. Duff of Linefork, Letcher County, Kentucky. Stalks of ordinary corn were readily pulled.

In addition to big, sturdy hybrid corn, the visitors saw a meadow of red clover, lespedeza, timothy and redtop, and herds of brown Swiss cattle and IOC hogs.

Five hundred and eighty-four persons attended the meeting, according to County Agent Corbett Lovely.

Independent Stores Organize

The independent retail stores of the country are getting set to meet whatever competition the chains have to offer in this postwar period. That is the gist of a recent article in the Wall Street Journal.

As the Journal says, "Significant of the determination to 'keep the pace' is the fact that more and more independent merchants are associating themselves with large central supplying organizations, which, because of their giant size, can offer to their small retail associates merchandising advantages enabling them to compete with the big chain outlets."

Some of these big supply outfits furnish dry goods. Some furnish foods. They all work on the principle of big turnover and small unit profits—which is precisely the principle that led to success for the chains. One of the old-established alliances has more than 5,000 independent stores affiliated with it, thus out-distancing any chain organization.

This is the kind of progress that makes fair competition for all retailers—and guarantees maximum service and economy for the consumer. Chain competes against chain, independent competes against independent—and chains and independents compete against each other. And the customer profits thereby.

No one need worry about the chains driving the independents out of business. The intelligent independent gives the chains plenty of competition. It gets its fair share of the business. And the public benefits all along the line.

MOTHER: "I hope your roommate at the training school is a nice boy, Robert."

ROBERT: "Judge for yourself, Mom. The other night he barked his shins on a chair in the dark, and I heard him say, 'Oh, the perversity of inanimate objects!'"

Legitimate Distributors Handicapped

While Congress discusses the future of OPA, black markets spread. If they continue to spread, the legitimate retail distribution industry cannot be expected to operate successfully. The threat is serious enough to have a bearing on renewing the Emergency Price Control Act. No law should be allowed to work against retail distribution.

The New York Times cites an instance of the black market problem—beef. Says the TIMES: "With about 75 per cent of the nation's beef at retail levels having passed to the control of black markets, the time is at hand when definite steps should be taken to restore that essential product to legitimate ehannels of trade if one of the world's finest food distributing systems is not to be damaged irreparably."

If it is to be a choice between saving the OPA and saving the distribution system there is no alternative. The country can live without the OPA; it cannot live without orderly distribution.

Another Retreat

Now that the air has cleared around the coal strike controversy the terms of the settlement are beginning to show in familiar outline. It is the old story. When the strike reached the point of crisis the government took over the mines and gave the miners what they wanted. If the coal industry refuses to accept the terms of the agreement arrived at by Mr. Lewis and the government, apparently the government would take over the mines permanently. Once again arbitration was thrown out the window in another step toward permanent socialization of the mines.

The tactics of the unions and the government are destroying private industry—the kind of industry that must survive if independent jobs are to survive, in fact, if representative government itself is to survive. If private industry and private property are fiped out, the basic reason for the labor union will also disappear.

Some of the conclusions to be drawn from the latest government union coal agreement, as described by Paul Mallon, Washington corerspondent, are: "Lewis won the right to tax 5 Cents each ton of coal produced and this will net the union $25,000,000 to $30,000,000 or more each year, depending upon production. . . . The operators are to collect this presumably in the price of coal and turn it over monthly to a board of three: Lewis, the government coal mine administrator . . . or some Truman appointee, and a third man chosen by agreement between Lewis and the Truman appointee. Even after the mine operators get their mines back, they, the public or even the miners would have no say or knowledge of the handling of the fund, except as provided by these three. . . .

"After being off work 45 days in the strike, the text (of the agreement) directs all miners to take a 10-day vacation beginning June 29 for which they are to be paid $100 each in advance ($4,000,000 for 400,000 miners, in the midst of reconversion after the strike absorbed stocks and forced industries to close).

"The additional pay raise is about 20 per cent . . . ."

The miners were entitled to pay increases and other benefits offered by the mine operators before the strike, but the operators and the public deserved some consideration too which as usual they did not get. Intelligent labor legislation is a neeessity.

Fire Is a Menace

If the news was flashed over the nation that one of our principal citics was destroyed by fire, with a lost if 10,000 lives, everyone would be running for an extra edition of their newspaper to read of the disaster. And yet such death and destruction happens every year in the amount of property and the number of lives lost by fire, and most persons think nothing of it—in fact, they help ereate the holocaust by their carelessness.

This tremendous loss the nation suffers annually could be cut to a minimun if the public would eliminate the fire hazards which are entirely within their control.

Human beings must have fire for heat and power, but is not necessary to be eareless with this two-edged sword which destroys or creates. Fire is a hazard at best and it is advisable to treat it with respect..

The Power-At-Cost Racket!

Communities throughout the United States now being urged to organize public utility districts (PUDs) to acquire the existing electric companies serving them or put in duplicate lincs to use power from tax exempt government-owned power projects, can afford to stop, look and listen when they read how PUDs work in the State of Washington.

The May 18 issue of the Oregon Voter says, "Washington PUDs, including several which have been in operation sincc 1942 or longer, are this year collecting $329,052 from the pockets of taxpayers of their territories. This is a means of holding down the cost of kilowatt hours of electricity, not publicized by PUD promoters and advocates. One never hears about the fact that PUDs in Washington make a better showing than otherwise would be possible because of the hidden revenue taken as taxes. Thirty-one Washington PUDs have levied a grand total of $2,552,809 against taxpayers. Figures are all taken from official sources, those for 1946 from a report by the Division of Municipal Corporations of the State Auditor."

When it is considered that PUDs are not taxed as are private electrie companies, when it is considered that they destroy taxes paid by highly taxed private electric companies, and when it is considered that on top of that they tax local communities to enable them to make a showing of low power rates, even a child can see the unfairness of their competition with private enterprise and the manner in which they bleed the taxpayer.

If socialized power is a success, it could pay taxes to support government as does private enterprise. If a community is to be taxed to provide low power rates which are the least of a family's bills, why not tax it to provide butter, eggs, bacon, and clothes below actual cost? Or must some private industry be left to tax to financc socialized industries?

Recipe for Scarcity

A year ago, when the war ended, the American people were regaled from all sides with extravagant forecasts concerning the reconversion of industry and the production of consumer goods. According to the optimistie predictors, the country would soon be treated to an enormous flood of merchandise ranging from unlimited quantities of nylons to revolutionary new-era automobilies.

The truth has turned out to be the exact opposite. As Benjamin H. Namm, president of the National Retail Dry Goods Association, put it in a recent address. "I do not hesitate to state that there's less goods, staple merchandise available at popular prices today than at any time in my experience as a retail merchant. There are less shirts, hosiery and men's clothing on retail shelves than at any time during the war years, when we were fighting two wars on widely seperated fronts, maintaining an armed force of 12 million men and sending out vast quantities of goods under lend lease.

"We have governmental reports, of eourse that our productiion is the 'highest in years.' These figures, however, are grossly misleading. They take no cognizance of quality deterioration, the disappearance of low-price goods, subsidies or the greatly decreased value of the dollar."

So long as businesss remains the slave of politics we will have an economy of scarcity instead of an economy of abundance.

Another Billion Dollar Tax Baby

The Senate Foreign Relations Committee has released the minority report filled by Senator Walter H. White, Jr., of Maine, covering a resolution to ratify the agreement with Canada for completion of the St. Lawrence waterway and power project.

The Senator takes emphatic exception to the resolution. First, he contends, that the Construction requires ratification in the form of a treaty subject to approval by two-thirds of the Senate. If international agreements concerning matters of such great magnitude and costs may be approved by a mere majority vote of the two houses of Congress, it will divest the Senate of its treaty-making power.

Senator White is highly dubious of figures which estimate a total cost for the entire project of $619,500,000. This estimate was based on 1939 and 1941 costs, and omitted a number of necessary items including interest during construction amortization, and expense of deepening channel entrances. The Senator believes additional cost of completing the project would run it to $771,000,000--and that, if past expenditures made by the United States and Canada are added, the total expense would be at least $936,000,000.

Of very great importance, Senator White questions the old claim that the American farmer would benifit from the project. Of the total grain crop raised annually in the 16 states tributary to the proposed waterway, he says, less than one-half of one per cent is exported. Under normal conditions, the United States exports less than 2½ per cent as much grain as does Canada. In Senator White's words, "The benefit to any one farmer would be insignificant, but this flimsy bait has been dangled before the farmer's eyes for over 25 years to obtain his support of the project.

The minority report makes other telling objections to the St. Lawrence proposal. They should be impartially weighed before we commit ourselves to a project which would cost approximately a billion dollars, be damaging to vital American industries, and return few if any benefits to the country at large.

Tomorrow May Be Too Late

The old saw that "great oaks from little acorns grow" is applicable to fire prevention as well as to other matters. A little care can prevent great conflagrations.

As an example of this, a large merchandising system has adopted the policy of collecting daily all trash which is not immediately disposable and placing it under an automatic sprinkler system in the store basement. This has prevented at least three fires during the past year.

Fire prevention is as much a duty of the small business as of the great industry. During the war years, most property has depreciated from lack of maintenance--and the fire danger has increased accordingly. If a home or a business is destroyed, the cost of replacing it is two or more times as much as in 1941--and in many instances, sufficient labor and materials are not available even if cost is no object. Last, and most important, every fire brings with it the risk of loss of life--as the recent hotel disasters so horribly demonstrated.

Such hazards as accumulated trash, inadequately insulated heating systems, worn, exposed electric wiring and faulty cooking equipment are responsible for a high proportion of fires in homes. All of these hazards can be corrected. And this is literally a case where tomorrow may be too late to effect the needed rspairs.

Farm Shop Will Pay Dividends; Not Too Expensive to Set Up

by KENNETH B. MC PHERSON

One of the rural institutions that is passing off of the American scene is the country blacksmith shop. Just a very few years back at least one blacksmith and sometimes two could be found in every good agricultural community in the land. Their establishments were so close together that most any farmer could ride his mules to the shop for shoeing in a short time, or drive any broken implement there for repair. The shop was a favorite gathering place for men, boys and mules on a rainy spring or summer day.

The popularity of the automobile for transportation and the tractor and other more complicated machinery for heavy farm work, have combined to almost eliminate rural repairmen. Those that remain are getting along in years and very few young men are learning the trade. The young men with mechanical talent are going to the garages and mechine shops where the opportunities seem to be better.

The practical answer to this repair problem is a shop on the farm with whatever tools that are necessary to fit the neens. Electric shop tools have lessened the skills necessary to fit the needs. Electric shop formerly were done by hand and by guess work.

A well equipped farm shop is not too expensive to set up and counting the time and money saved, will pay dividends from the beginning on.

If a good set of tools is available, each year during the slack season, all farm tools can be inspected and overhauled if they need it. In this way years are added to the life of the machinery, and when work in the field is to be done, the tools are ready. It is probably true that keeping things in good condition is of more value than fixing brokendowns. Keeping the number of breakdowns as low as possible, and the machinery working during seeding and harvesting, means less loss of profit and a great deal of satisfaction.

An electric arc welder and a one-half inch speed drill are two power tools not ordinarily found in farm shops but which would be found most useful. The arc welder saves time during the busy season, as many repairs can be made on the machines without dismantling. This saves repair parts, much labor tearing down and reassembling, as well as trips to town. The speed drill should be equipped with a stand so it can be used in place of a post drill. In such a way the drill can be easily removed by loosening one thumb screw.

Along with the two power tools mentioned above should go a high speed tool grinder. To do a complete grinding job it is necessary to have a one-half horse power motor or larger so heavy duty work can be performed. One stone should be provided for sharpening small tools, another for sickle and moving blade grinding and the third heavy duty wheel for plow points, axes and similar tools. In every case long shafts and small pulleys should be provided to permit free movement of the parts being ground.

An air compressor helps in many ways. In the future, in fact it is practically true now, all moving implements will be mounted on rubber tires. Proper inflation will add to the life of the machine as to the length of service of the tire. Compressed air is needed for machine cleaning and can be used for spraying paint on any machine.

Table saws and sanders will help with repairs to implements and buildings.

These power tools with a good assortment of small hand tools will make up the equipment of a good shop.

Not only will there be a feeling of security in knowing one is ready for any emergency, but also, it will give the farm boy. if there is one, a place to put into practice some of the things he has studied in farm shop in school.

Safety in the Mines

Despite the abundance of evidence to the contrary, ill-informed commentators periodically intimate that the coal industry has been notoriously remiss in improving safety conditions in the mines, and that accidental death and injury to miners is of small concern to the operators.

The truth is that the coal industry has given as much attention to inceasing safety as to any other problem. During years when it was losing money, it still made investment in new equipment and in more efficient and safer methods of work. Accidental deaths in coal mines, have, generally, gone steadily down over the years. In 1945, for instance, the average number of deaths per million tons was 1.-72 as against 3.80 in 1918.

The industry is continuing its elaborate program in the interest of maximum safety. Some of the problems involved are extremely difficult, and their solution requires time and enormous amounts of money. Strikes and governmental interference have unquestionably been a retarding factor in many instances. The industry, regardless of these difficulties, is fully cognizant of its responsibilities to the worker, and is progressing accordingly.

State Medicine Costs Money

It is no accident that very little is said by the proponents of state medicine as to the cost of their proposals. Their arguments are confined to humanitarianism because the problem of cost is too unpleasant to discuss.

But the people have got to face the cost of social security and socialized medicine, for they must pay the taxes to support them. They should not be sold a bill of goods until they know what it will cost.

One competent authority writes, "During the next ten or fifteen years, the total annual cost of social insurance will be somewhere between one seventh and one-sixth of the payroll, or $10 to $12 billion. It is almost certain that before the costs are stabilized, they will equal or exceed those of the British system which are estimated at 24 per cent of the wage bill." The same authority estimated the cost of state medicine alone, such as proposed in the Wagner-Murray bill, at 7 billion dollars by 1960.

This is something for all Americans to think about.

Free Market Vital

For years chain stores have had to withstand discriminatory taxation and legislation intended to limit their number and existence, on the theory this would benefit non-chain stores. Such class measures are still in effect in many states, to the detriment of the buying public.

Adam Smith, a great philosopher of the 18th century, emphasized that, "To widen, the market may frequently be agreeable enough to the interest of the public; but to narrow the competition must always be against it, and can serve only to enable the dealers, by raising their profits above what they natually would be, to levy, for their own benefit, an absurd tax upon the rest of their fellow citizens."

This logic has a direct bearing on anti-chain store legislation. A market can't work as a free market when a merchant is penalized for bringing greater economy to the consumer. Class taxation or restrictions is a dangerous weapon and a very destructive force in a free economy. There can be laws to protect the market from unscrupulous trade practices which destroy legitimate competition, but legislation to cripple one business for the alleged benefit of another does not protect a free market.

A Blazing Nation

Fires in the United States are now taking a toll of 10,000 lives yearly in the most horrible kind of death—burning.

The nation will suffer the largest fire loss in history in 1946, says Frank A. Christensen, President of the National Board of Fire Underwriters, unless united effort is made nationally to check present excessive burning which is due largely to carelessness.

"The appalling rate of increase in our national fire losses calls for the attention of everyone interested in the general social and economic welfare of our country. If the present rate goes on through 1946, the toll of our real wealth, much of it productive wealth which our people can ill afford to lose today, will surely pass $600,000,000. That will make 1946 the worst year of reckless burning our nation has ever known.

"Equally shocking and appalling is loss of life. A few months ago newspapers and radio news periods had extensive reports of a 'Blazing Sunday,' on which 26 lives were lost in a few spectacular fires. That seemed unusual but it was not. An average of 27 lives are lost in fires every day."

Too many people still feel that fire prevention is something that the other fellow should practice. The fire loss will never be controlled until every individual becomes conscious that fire is dangerous and helps eliminate fire hazards.

Mr. Christensen, in asking public cooperation in fire prevention, is merely asking for the people to help save their own lives and their own property. Fire insurance can replace some property but not lives. It can never cover many of the effects of fire such as lost jobs, irreplaceable articles, the tragedy of being without a home, not to mention articles of sentimental value.

The Framework of Industry

The people of the United States are so used to big figures and an abundant supply of everything when they want it that they pretty much take the nation's basic industries and the products they produce for granted. Even disastrous strikes have been unable to cripple the country to the extent it would seem they would.

Comparisons are necessary to appreciate our industries. For example, the wartime output of steel in Japan was $9,656,000 tons in the record year of 1943. But the United States mills could have made that steel in 38 days.

Few people think of steel in connection with farming. The bond between steel and the farmer in this country is as old as the steel industry itself. The first iron made here was produced in 1645. Many of the first iron workers were farmers whose needs for the metal were so pressing that they would leave their fields to work in the local blast furnaces making iron for ploughshares, nails, hand tools, etc. The farmer is now among the largest consumers of steel. Strange as it may seem, steel has largely replaced the horse on farms. Without modern motor equipment the farmer would be helpless today.

It would not be many months before the United States would come to an absolute standstill if its steel was shut off.

It is a good thing for the public to become aware of how it is affected by conditions which encourage or discourage our basic industries, and steel is the framework which supports all industrialized America.

Power for 3,000,000 Farms

"The utility industry. . . . .is about to launch the greatest rural electrification program in the electrification of some 3,000,000 farms half of the nation's total,--which are not electrified at present.

Plans for this enormous undertaking were laid at a meeting between the electric light and power companies and the American Farm Bureau Federation, the county's largest farm group, some months ago. It is significant that the industry invited the Rural Electrification Administration head to join in the program, but he refused.

Whether or not the REA Cooperates, Mr. Callahan states, the program will go forward. Private utility companies have already budgeted $300,000,000 to cover construction and extension of electric lines in farm areas. Before the end of 1948, according to estimates, farmers will buy more than $500,000,000 worth of electrical equipment to use the power furnished.

This program differs only in scope from previous rural electrification projects undertaken by the private electric industry. It pioneered rural electrification decades before the government-subsidized REA existed. In good years and bad, it has expanded its service and reduced its rates. And it has done it with its own money, not tax money.

The new program will mark a milestone in the history of agriculture. It will mean greater production at reduced labor and cost and a higher standard of living on the farm.

The Public Health Problem

No one can quarrel with efforts to improve the public health, such as motivates the pending Wagner-Murray-Dingell Bill, now in Congress. But the proper means of attaining the desired end are certainly debatable.

This bill would attempt to meet the problem by establishing what would amount to a Federal bureaucracy to control and administer the practice of medicine. It would heavily tax the worker and the employer to meet the costs—thus still further reducing the employes' "take home" pay. It would limit the individual's freedom of choice in selecting a doctor. Worst of all, from the standpoint of medical progress, it would place in the hands of a political appointee, sweeping and all-important powers over doctors, hospitals and the medical arts in general.

This is not the proper solution. During recent years, very great progress in the extension of medical care has been made through the voluntary prepayment group plans for hospital and medical care. Under this system, the worker pays, on a purely voluntary basis, small sums monthly to a private organization. In case of accident or illness, he receives all medical services needed. The finest of facilities are provided. Certainly, this is a far better thing than "regimented" medicine—and the Wagner-Murray-Dingell Bill would make regimentation inevitable.

Wages and Employment

It's easy to sympathize with the workers' desire for higher wages. At the same time, wages can be carried to a level where employment is endangered.

Coal is a case in point. Heavy increases in wages and other labor costs have made high prices for coal unavoidable. And when the price gets too high, consumers begin looking for cheaper forms of heat and energy. Then demand falls off, and employment drops with it.

No one knows just what the "price saturation point" of coal is. But it is obvious that it can't increase in cost indefinitely—and it is equally obvious that operators can't long sell at a loss. The industry has made very great progress over the years in improving producing methods to hold down prices. But arbitrary wage increases could offset all this.

A fair price to the consumer is as important as a fair wage to the worker and a fair return to the owner. We must achieve a sensible balance between all three if our economy is to survive—and we are to have sustained employment.

A Steady Market Counts

It should be made clear to the public that the costs of certain basic commodities and services like oil, electricity, and insurance do not rise in price every time the market suffers an upsurge.

William R. Boyd, Jr., President of the American Petroleum Institute made the statement recently that the prices of gasoline, fuels oil and other petroleum products have always been determined by the costs of production and the eeaseless eompetition among the eompanies in the industry.

He said, "The petroleum industry like other sound American industries will do its best to hold the lines on product prices. Under normal conditions costs vary, and prices vary with costs. If we all work together, in due eourse not only can product prices be held, but in many cases they can be reduced as full production and efficient operation are achieved by the effective eooperation of companies, employes and the public."

A sound industrial policy is not based on the theory that the greatest profit comes from inflated prices. Industry depends for its existence on a stable and steady market. As Mr. Boyd points out, prices reach a natural level when full production and efficent operation are achieved.

Politics and Your Money

Lost in the welter of news concerning the A-Bomb, the United Nations Conference, and other items of cosmic importance, is a fact whieh should be known to all people of the United States. That fact is: this country, for the first time in many years, can have a balanced Federal budget.

All the American people should also consider the words of President Truman when he said: "For fiscal 1948 we must plan not only for a blanced budget but for a . . reduction of the national debt. Sizeable debt reduction is nothing short of obligatory."

As Time put it, the President's budget "might not please practical politicians, but would be applauded by practical fiscal experts." Its prineipal points are that tax reductions shall not be made at the present time, and that strict economy prevail in government spending.

Just what is going to happen to this policy remains to be seen. It is evident that Congress is about as free with the people's money as ever. It is still voting money for needless waterpower developments, to name one source of gigantic waste, and other useless luxuries. This is an election year, and the boys who want the votes are saying it with the public's dollar.

We will have economy in government only if the people make it clear to Congress that unbridled spending is the road to political defeat--and not the road to eternal reclection. And if we don't have government economy, we will have inflation and eventual economic ruin on a scale unpreeedented here. Profligacy can be as destructive to a nation as to an individual.

Two and Two Make Four in All Countries

"It is useless to talk of labor's purchasing power encouraging business if business is asked to produce goods at a loss," says the New York Times éditorially. "We cannot have full employment if people are discouraged from becoming employers."

When business can no longer employ and produce, government will step in and the state bureaucrat will be the economic dictator. Then we'll have exactly the essentials of faseism, here at home, that we fought the most destructive war in history to destroy.

Responsibility Comes with Power

In an editoral on labor legislation, Collier's recently said: "We need labor laws which will preserve the strength of the unions and their right to strike in proper cases, but which also will require them to be as responsible as they are powerful. . .. . .

"We can't see why a labor organization should not be liable in money damages for injuries which it wantonly and directly inflicts on other people. . . .Corporations are liable for personal injury and property damage, and for breaeh of contract. Why not labor unions?

"The time has come, we think, when labor organizations, because many of them nowadays are big businesses, must be required by law to publish periodic, detailed, independently audited statements of their finanees--full accounts of who contributed how much money each year, what it was spent for, who spent it."

Unions are in a preferred position in all negotiations with industry. The extremely unfair Wagner Act, however exeellent the motives, makes that inevitable. Industry is bound by a rigid set of rules, and the government sees that the rules are kept. The unions, on the other hand, are virtually free to make up their own rules as they go along--and to change them at will when that seems desirable. Breaeh of contract is commonplace.

Every piece of legislation, no matter how moderate, which is designed to place the unions on the same legal basis as other organizations is fought virulently by labor leaders. These leaders don't see that when the public gets a bellyfull of labor abuses, it will demand legislation which will really crack down on labor boss dictation and destroy some of its most prized rights. It is to labor's direct interest to support legislation of the type Collier's advocates. And it is to the interest of citizens to see that Congress acts.

The Simple Issue

The seeds of another worldwide armament raee among the great powers are being planted now--less than a year after the end of the most destructive war in history.

All of the major nations are earrying on extensive experiments with "bigger and better" tools of slaughter. Pilotless airplanes--rockets which are an "improvement" on the horribly destructive German V-2 type guns which fire streams of molten lead instead of bullets electrically guided bombs of unimaginable force--these are but a few of the hideous weapons now in the laboratories or the proving grounds.

Topping them all, of course is the atom bomb. According to authorities the bombs so far exploded developed only a microscopis percentage of their potential destructive foree. Compared to the bomb of tomorrow, they are like a firecracker beside a stick of TNT. And no scientist believes that atomic bomb construction and development can long remain the secret of one country. No nation has a monopoly on scientific knowledge and intelligence.

Here is the greatest of all arguments for international understandings, international tolerance, fair international give and take in the interest of a permanent peace. So long as mistrust runs rampant through the world, all the great powers will seek new and even more terrible weapons. And every arms race in history has ended in war.

The issue is a simple one--we will have life or we will have death. We will build a better world or we will destroy it utterly. We will have peace bteween nations or we will have no nations at all. Today all mankind faces the greatest problem it has ever known.

"Why do you have sueh a high bed for your little boy?"

"So that we ean hear him if he falls out of it."

Need Is Cited For Additional Alfalfa Crops

By Glenn G. Summers

The acreage of alfalfa in Middle Tennessee has doubled and trebeled in the last few years. There is, however, need for further expansion of the crop. Few dairy farms have enough alfalfa hay. Agriculture authorities have suggested as a goal for dairymen, a "one acre of alfalfa for each cow in the herd."

From the standpoint of livestock food production per acre, only one other erop that we grow in Middle Tennesseee can approach an aere of alfalfa and that is sorghum for silage. Here are tabulations or returns on alfalfa compared with returns on other crops. Alfalfa that yields three and one-half tons of hay per acre provides 6,328 pounds of dry matter, 741 pounds of digestible proteins and 3,521 pounds digestible nutrients. Clover will produce about one and one-half tons of hay per acre which is equal to pounds of digestible proteins and 2,601 pounds of dry matter, 207 1,536 pounds of digestible nutricnts. Sorghum for silage will produec about 12 tons of silage, which is equal to 3,888 pounds of dry matter, 160 pounds of digestible proteins, and 2,533 pounds of digestible nutrients.

From the above one can see that alfalfa produces more dry matter per acre than other crops. Whilc the three and onc-half ton yield is about average on that basis alfalfa produces 741 pounds of digestible proteins per acre. In other words it would take 21.9 bags of 41 per cent protein meal to equal the amount grown on one acre of alfalfa. In addition to producing the equivalent of 22 bags of cotton seed meal, alfalfa produces 2,966 pounds of other digestible nutrients. Also on the same basis, there would be taken off in the hay 581 pounds of mineral mostly lime and phosphate.

The rains we have had through out the Nashville milk shed area during the past several weeks, should show many farmers to get their alfalfa ground in excellent shape. A well prepared seed bed is of vital importance. The land should have already been turned but if not it should be turned immediately. If there is a crop of weeds it would be advisable to disc the land before turning it. Immediately after breaking the ground it should be harrowed and worked down. A cultipacker probably will be your best tool in farming and pulverizing the seed bed. After the land has been paeked down it should be limed, using approximately three tons of ground limestone per acre. The lime should be disced in and then the ground cultipaeked behind the disc. Also there should be applied 20-25 pounds of borax ahead of seeding.

The most favorable seeding dates are August 20 to September 20. The land should be harrowed and cultipacked immediately before the sceding is done. The amount of seed to sow probably can be set at 20 pounds per acre.

The best recommended practice is to sow 10 pounds of seed each way. The seed may be sown with a regular alfalfa seeder or any of the sand seeders as cyclone, horn, wheelbarrow, etc. Many good growers prefer to sow 10 pounds of seed one way and follow that immediately with a cultipacker and then sow the rest the ether way and then cultipacker again. No other covering of seed is needed. In the absence of a cultipacker a light drag harrow can be used for covering the seed. It is recommended that Kansas or Oklahoma grown seed be used. It has not been found advisable to use the grim or hardy type in Tennessee. The seed, of course, should be innoculated.

On soils that will respond to fertilizer an application of 200-499 pounds of 20 per cent acid phosphate and 100 pounds of muriate of potash should be used per acre. If it is not possible to get straight potash and phosphate, then 300 pounds of 37-6 fertilizer ean be used. This will not furnish as much potash or phosphates as the amount suggested above but it should be sufficient.

So far I have not said anything about the type of soil to use in growing alfalfa. About the only requirement is that the soil be well drained and not subject to overflow. Other than that, all types of soil in the Nashville milk shed will grow alfalfa. The better the soil, tthe better alfalfa crop you can expect. Alfalfa will work well on land that has become infested with Johnson grass. The frequent euttings of alfalfa hay will keep the Johnson grass in eheck and it will not be possible for the Johnson grass to mature seed. If alfalfa is seeded on such land it should be seeded in the fall and never in the spring.

The Hobbs Bill

Passage of the Hobbs Bill, whieh was singed by the President on July 3, was made neeessary by the racketeering activities of eertain organized labor groups.

Genesis of the bill goes back to 1941, when a New York City teamsters' union stopped trucks arriving from outside the eity, and compelled shippers or buyers to employ union drivers and pay them the union scale. Threats and violence were employed. A farmer driving his own truck and helping his own produce was forced to hire a union driver. A test case was taken to the Supreme Court, which held these activities did not violate the Federal anti-racketeering act, and that remedial action would have to be taken by Congress.

The Hobbs Bill is the result. It simply makes it unlawful for unionists, along with everyone else, to interfere with interstate commerce by extortion or robbery. It does not interfere with labor's rights to strike or picket. It is in no sense a "class" measure.

It is a remarkable fact that some labor leaders vehemently objected to the passage of this bill by Congress, and its signing by the President. To all intents and purposes, those objectors were saying, in effect, that union labor has a right to rackeer, to threaten, and to use violence to gain its ends. The plain fact is that such a measure should have been enacted long ago, and Congress' long delay in passing it is indefensible.

The Hobbs Bill is not designed as the answer to all our labor difficulties. It simply puts unionists on the same basis as all other eitizens so far as the observance of ordinary rules of law and order is concerned.

His Master's Shoes

By Fred Cornelius

"BUTCH," our three-year-old neighbor, went for a walk the other day, all by himself.

When he was about a block from home, he sat down and pulled off his shoes and socks, and when he started out again, he left them right there on the sidewalk.

Butch found his way back home at last, just as his mother was about to go in search of him. The shoes were not missed till later.

In about an hour, "Gus," the boy's pet bull puppy, also went out for his daily walk.

He came upon the shocs and sniffed them. He must have recognized a familiar smell for he gathered the shoes up in his mouth and trotted home. He laid the shocs down in his own front yard and went back and brought in the little red socks.

Then he lay down near them and waited for someone to come and take them into the house.

What's in a Name?

Shakespear's statement in Romeo and Juliet: "that which we call a rose by any other name is just as sweet" apparently does not hold true with people north of the Mason-Dixon line who buy sweet potatoes. Hazel Mcacham, marketing specialist of the North Carolina Extension Service, says the sweet potato becomes a "yam" when it crosses this imaginary line.

She says the northern and eastern consumers buy yams as improved sweet potatoes. She pointed to marketing tests in which a sign "Sweet Potatoes, three pounds for 28 cents" was displayed. The potatoes sold very slowly. When the sign was changed to "Yams, three pounds for 28 cents" for the same bin, the potatoes sold much more quickly, she stated.

Farm Depression Forecast Unless Curbs Are Invoked

WASHINGTON—(AP) — Looking beyond the postwar relief period, the agriculture department yesterday envisioned the nation faeing a ehoice between "rigid rationing of land and labor" to curtail farm production, and measures designed to maintain a high level of eonsumption and exports.

Otherwise, it said in effect, agriculture may be thrown into another depression by "revolutionary changes" in farm production which have taken place in the last quarter century.

In a report entitled "Changes in Farming in War and Peace," the department said that "regardless of the market outlook, there is no road back from the agricultural revolution that has been expcrienccr during the inter-war period and World War II."

Can Be Expanded

The department said that "as markets for farm products can be expanded, and as the total volume of farm output cannot be reduced without rigid rationing of land and labor," it appears that the country should reverse the slogan of the thirties—"adjust production to market demands."

Recalling efforts to curtail farm output under the AAA program, the report said experience "suggests that it is less difficult in times of depression to increase the market outlet for farm products than it is to reduce the total volume of farm output."

The report was written by Sherman E. Johnson, a department economist in charge of research on farm production. He asserted that "human distress would be aceentuated if farmers were to attempt to reduce the total volume of food output."

Should Have Insurance

The report said, however, that in periods of depression, farmers should have "income insurance" which would protect them against disastrously low prices. This, it stated, would be the farmers' counterpart or minimum wages and unemployment insurance.

"Procedures can be developed that will promote a high level of demand for farm products—for domestic consumption, for industrial uses, and for export," the department said.

"A national goal of adequate food for health available to all citizens, regardless of the level of economic activity, would go far in the direction of providing stable outlets for farm products.

The department said, however such a goal would require that public measures be devised to provide adequate food for those who cannot afford it even in times of prosperity, and that such programs be expanded as needed if depression eomes.

The report did not suggest any specific measures, but department officials previously have suggested a broad food stamp program patterned after that used before the war to move surpluses to dinner tables of low-income groups.

New Soybeans Are Better

Two new varieties of soybeans, developed in Georgia and North Carolina, promise farmers more and better hay and higher yied of seed with higher oil content. Both varieties, the Roanoke in North Carolina, and the Gatan in Georgia, were developed by agronomists of the respective experiment stations.

The Roanoke matures around October 25 and produces a seed smaller than other varieties. It has given higher seed yields and a greater volume of oil than other varieties in tests since 1941. It also shows resistance to shattering, say Dr. E. E. Hartwig and J. A. Rigney, agronomists who directed the work.

In Georgia the Gatan variety, a cross from the older and well-known Otootan, has much the same characteristics and promises a larger and better hay yield. It averaged 14.7 bushels per acre in ten-year tests as eompared to 8.2 bushels for Atootan, reports R. P. Bledsoe and W. R. Gore, agronomist who developed the new variety at the university.

Stabilizing Wage Dollars

Writing in an official AF of L publication, William Green recently urged the 7,000,000 members of his organization to "stabilize their wage dollars by helping to increase volume of production which can wipe out scarcities and the danger of runaway inflation." An accompanying cartoon drives this thought home with its caption: "Bring prices down by producing the goods!"

If Mr. Green is able to make this message felt he will be doing a signal service for all the American people, as well as union labor. For, as the New York Herald Tribune puts it, "Here in the simplest terms is the fundamental answer to the whole problem of inflation—production." There are, of course, other factors involved, such as excessive government spending which in itself is a strong inflationary influence. But production is at the root of everything.

Our industrial potential is the greatest on earth by a wide margin. We have, in addition, a superbly efficient distribution machine to take the goods to the consumer once the factories produce them. Retailers, led by the big chain organizations, have been a frontline defense against unavoidable price increases. They have led the war against the black market. But, until adequate production is resumed, their work can be only partially successful.

Price control by government, at best, is but a temporary and incomplete expedient. Rising prices are the symptoms of inflation—not the cause. If we produce the goods, we will have price stability.

Nothing Is "Good Enough"

So far as the consumer is concerned, the main job of the oil industry is to provide him with a constant, reasonably priced supply of gasoline, fuel oil and other petroleum products when and where he wants them and in the quantities and grades desired.

Looking at the oil industry from the point of view of the long pull, however, some activities which few consumers ever see at first hand are of even greater importance.

First, it isn't enough just to have sufficient oil in sight for this year or next year. The industry must think five, ten, even twenty years ahead. It spends enormous sums in prospecting new potential oil bearing areas. It sinks deeper wells, in order to get the most out of every field. It carries on elaborate conservation activities to safeguard oil reserves. As a result of this, vast new reserves are constantly being discovered.

Second, it carries on unceasing laboratory work to develop better oils and lubricants. The many special fuels, used for military purposes during the war, such as gasoline of extremely high octane content, are an example of this. The great progress made is now being adapted to eivilian needs. So, little by little, you get better gas for your car.

Great producing industries must also be great research industries. Nothing must ever be considered good enough—instead, a constant search must be made for something better. Oil typifies that industrial philosophy.

Protection for the Shipper

The long-established railroad rate-making machinery, which will be destroyed if the current anti-trust suits instigated by the Department of Justice are successful, was developed primarily for the benefit of the nation's shippers who find it necessary to negotiate rate adjustments with the railways, George H. Shafer, General Chairman of the Northwest Shippers Adisory Board, recently stated. He added that this machinery has enabled the shipper, at all times, to know just what rates are proposed for competing territories, and has provided an opportunity for him to present his views and arguments.

In essence, the anti-trust suits against the railroads would prevent the carriers from conferring with each other on the subject of rates. At the same time, the Interstate Commerce Act makes it mandatory that carriers establish joint rates meeting with the approval of the Interstate Commerce Commission. Just how joint rates could be established without conferences among the various railroads is a completely unanswered question.

The solution to this serious problem lies in passage by the Senate of the Bulwinkle Bill which was approved by the House last December by an overwhelming vote. The Bulwinkle Bill would simply remove any doubt as to the legality of present rate-making practices under the anti-trust laws by placing the entire matter within the jurisdiction of the ICC. It would in other words, maintain in effect a system of rate-making which has been praeticed for years, and has operated with efficiency and fairness to all. It is significant that when testimony on this bill was taken from all parts of the country unanimously approved it.

No one need fear that this measure would give the railroads a chance to unjustifiably raise rates. The ICC, one of our most respected and non-political government agencies, would have the last word in every case. The interests of all would be completely protected.

The Unconscious Arsonist

Arson is one of the most detested of all crimes. The law imposes extremely severe sentences on convicted fire-bugs. For, when a man deliberately starts a fire, he is imperiling lives, to say nothing of causing potentially great losses in property values.

There is another group which the law can't touch. These are the people who might be called "unconscious arsonists." That group includes a high proportion of the population.

The sin of the "unconscious arsonist" is that of omission, not commission. He doesn't purposly set a fire. He just fails to do the things that will prevent fires.

Have you, for example, ever put off "until tomorrow" fixing afrayed lamp cord? Have you let a slightly defeetive heating plant go. figuring it will last another month or so Have you been careless in handling inflammables like gasoline, on the grounds that probably nothing will happen? Have you let old papers and other trash accumulate in closets and basements and attics because you don't feel like carting it down to the junkman?

These are typical examples of "unconsious arson." And the man who can answer "No" to all the questions is a rarity indeed. The hundreds of millions of dollars of property destroyed annually by fire are a dubious tribute to the indifference of otherwise good citizens. So is the fact that fire loss is showing an alarming increase at the present time. Do your part, in your home and business, and fire can be licked—and the lives and dollars it destroys will be saved.

Can the Farmer Afford It?

The Country Gentleman recently ran an editorial on the plan to extend "social security to farmers" in the form of pending Wagner-Murrary-Dingell Bill.

This bill, among other things, would give the farmer old-age and retirement pay, a system of government-controlled medical insurance, carious disability benefits, and unemployment insurance. All of this may sound very appealing. But when the cost is computed, a good deal of the appeal vanishes. The total cost of the plan to farmers, according to the Country Gentleman, which bases its editorial on a recent research study by Social Forces, would be $420,000,000 a year, using 1940 as a base. In a more prosperous year, such as 1943, it is estimated that the the cost might rise to $565,000,000. By comparison, all farm real-estate taxes paid in 1940 totalled only $400,000,000.

This plan would be financed, in part, by taxing the farmers' income. A farmer with an income of $2,000 a year, for instance, would pay $100. Further he would be liable for a 4 per cent payroll tax if he hired any help. Lastly it is estimated that even this revenue would be insufficient and the government would have to make up the deficit from other sources of income-which means eventual higher taxes on everyone, farmers included.

As the Country Gentlemen concludes., "It seems that such a vast and complicated affair calls for more study before action is taken." The rural health problem, which is at the core of the Wagner-Murray Dingell Bill, can be solved without establishing government dictatorship of medicine. All of us are sympathetic with the motives behind such measures. But many thoughtful people are extremely dubious of the soundness of the method proposed.

Away from Squandermania

The President along with other national leaders, has done considerable talking concerning the need for strict control of government expenditures. This policy is urged as inflation control, no less than practical necessity to a nation confronted with a debt of almost $300,000,000,000.

If Congress is interested in following the Chief Executive's advice, it has many fertile fields for action at hand. As a starter, it could do worse than to investigate thoroughly the various appropriations for waterpower development, flood control, etc., which are constantly coming before it. These costly tax-exempt power development measures and their total runs into the billions—are unnecessary. At best, they would simply duplicate a service which is already being provided, without cost to the taxpayers, by the private, business-managed electric utilities. At worst, they would lead to the destruetion of private enterprise in the power business, and the lost of the gigantic sums in taxes which the publicly-regulated private utilities pay to all units of government.

As the Chicago Herald-American said in a recent editorial, "If the 70,000,000 life insurance policyholders, the 45,000,000 owners of savings accounts, and the millions who hold government bonds understood their own interests, they will insist on remedial fiscal policies at the nation's capital. In political terms this calls for a radical transition away from SQUANDERMANIA baek to frugality and thrift."

It is time, in other words, that we learned that the great spending orgy has to end. If it doesn't end, we will have a ruinous inflation. Economy in government must become a national policy if we are to successfully make the transition from war to peaee without destruction of the institutions and form of government we fought to preserve.

1,200 Pounds of Butter Is Declared 'Surplus'

VANCOUVER, B. C. A United States vessel, the Fairmount Victory arrived here recently with 1,200 pounds of surplus butter in her hold, and Capt. H. C. Gibb said the butter would stay aboard when the ship sailed for England and still would be there when it arrived back in butter-short America.

Captain Gibb said the butter was declared surplus by the United States war shipping administration when the vessel arrived at Seattle with troops from Yokohama.

He said the WSA told him to leave the butter aboard it had no use for it.

A Modified OPA

The recently enacted OPA bill is a compromise between those who believe the Office should be indefinitely continued in its old form, and those who believe that the time for governmental tinkering with the law of supply and demand is over. It is obviously designed as a sort of transitional measure, to bridge the change from a government-dominated war economy to a free enterprise peacetime economy.

The most important new feature is its establishment of a three-man "decontrol" board with power superior to those of the OPA administrator. The job of this board will be to remove controls from commodities when supply is in sufficient quantity so that the free market will automatically assure fair prices. If the board does that job successfully, it will be of immense aid in getting this country back to its traditional ways of doing business.

In the meantime, the consumers of the nation must realize that the basic solution to inflation lies not in law, but in vastly stimulated production and distribution. So long as the supply of available goods is below demand, we will continue to have black markets. So long as labor troubles, governmental interference, or anything else blocks the production machine, an out-of-line price problem will eontinue to be a major factor in our national life.

The distributive machine is doing a fine job, and it is ready to do still better when goods again become plentiful. Retailers in all lines of merehandise, paced by the big chain systems, have consistently worked against price increases. They cannot, of course, prevent price increases and necessary by higher wage, supply and tax costs. But they are a constant guarantee of the lowest price for what you buy, consistent with the economic conditions of the time.

Justice to All

There are alarming similarities between the current deliberations over treaties and the Versailles agreements which followed World War 1—and did so much to sow the seeds of World War 11.

Again the great powers are fighting for spheres of influence. Again, the dark shadow of "balance of power" politics hangs over the meetings. Again, the work of the delegates is hampered by secret commitments made during the war. This has been an especially difficult problem for Mr. Byrnes. And again, many of the smaller powers are living in fear of being sold out by the Big Four. The vehement protests registered by Dr. Evatt of Australia are an indication of this.

What seems to have been largely lost is that conception of "One World" which was so brilliantly argued by Wendell Willkie and which, in all its essentials, was once supposed to be the guiding policy of all the Allies. It was a conception based solidly and practically upon the conditions of the times. Today, space is of small importance to a nation's security—a bombing plane can fly anywhere in the world in a matter of hours, and a stratosphere missile can do it in minutes. A fragile peace, based upon force and fear, will be only a breathing space between the last war and the next.

The tremendous problem before the world is to establish a peace which will be fair to all nations, which will respect the rights of all nations, and which will make it possible for all nations to live together in the world without need of resort to arms. That kind of peace cannot come from deals between the great powers which use the small powers as trading material. It can only be built upon the sound foundation of justice to all.

Teacher—And what parable do you like best?

Boy—The one about the multitude that loafs and fishes.

Pepper Shortage Is Laid to Government

Baltimore—John N. Curlett, vice president of McCormick and Co., Inc., is a statement blamed the short age of black pepper in America on "Government agencies charged with handling it during the war."

He declared much "misinformation" has been disseminated as the the reason for the scarcity, adding, "the commodity has been very poorly handled by Government agencies."

He stated the agencies have "missed opportunity after opportunity to bring back pepper into this country, using an alibi the war and price control," and "ignoring suggestions" offered by the spice industry regarding pepper imports.

Mr. Curlett said all other countries enjoy free trading in pepper, enabling them to purchase and sell the spice at world price without restriction, while the commodity is rigidly controlled and under subsidy in America.

Because of this, he said, "the consumers have no pepper."

Prices Paid Farmers in June Are Highest Since Middle 1920

Washington—The Agriculture Department reported that prices received by farmers in June were highest since mid-1920.

Farm prices averaged 218 per cent of the 1909-14 level, compared with 211 per cent in May and with 206 in June a year ago.

The Department said that the June increases reflected advances in priees of cotton, feed grains, fruits, livestock products. The only decreases of any size were reported for rye, potatoes and apples.

The rise in farm prices has been accompanied, the Department said in a statement, by an increase in prices paid by farmers for things they buy.

Wheat Crop Estimate Boosted Materially

CHICAGO—C. M. Galvin, crop statistician for James E. Bennett and Co., revised his June 1 wheat crop estimate upward more than 50,000,000 bushels.

He estimated total wheat production this year at 1,072,543,000 bushels compared with 1,091,320,000 a month ago.

Mr. Galvin estimated winter wheat production at 831,171,000 bushels, compared with 751,089,000 a month ago and the latest government estimate of 774 588,000. He said there had been a marked improvement in the Southwest because of favorable weather.

Spring wheat was forecast at 241,372,000 bushels, compared with 268,231,000 a month ago and the latest government estimate of 250,921,000. He said a period of dry weather caused a lessening in production.

Mr. Galvin estimated the oats crop at 1,540,044,000 bushels compared with 1,454,860,000 a month ago and the government figure of 1,492,783,000.

West State Sweet Potatoes Sell at High Level

Sweet potatoes in West Tennessee this week are selling for 10 cents per bushel above the opening price of $1.25 when the market opened about a week ago, according to Tom Wingo, county agent of Gibson County.

Wingo said $1.35 per bushel was the price now being paid for the graded U. S. No. 1 potatoes. Other grades were selling slow and those that were moving were selling for about 60 cents per bushel. Farmers are accepting the price without much discussion he said.

Producers believe the potato crop is about average which is near 75 bushels per acre. Some are reporting yields of almost twice that amount.

The Porto Rico variety composes the bulk of the crop.

WOMAN'S PAGE

CHEESE SOUFFLE—WHEN MEAT IS SCARCE

Here's the answer for today's meal and many other days ahead—golden-brown Cheese Souffle that's a picture of deliciousness as it comes out of the oven. Light as a summer breeze and so easy to make with this tested recipe, it is also a perfect substitute for meat. Serve the family's favorite vegetables and round out the meal with fresh fruit and iced tea or coffee. The family will never miss the meat and you'll win new honors as a cook.

Light as a feather, it melts in the mouth

CHEESE SOUFFLE

4 tablespoons Spry
5 tablespoons flour
teaspoon salt
1-4 teaspoon paprika
dash of cayenne
1 1-2 cups milk
1 cup grated yellow cheese or a cheese
6 egg yolks, beaten until thick and
6 egg whites, stiffly beaten.

Melt Spry in saucepan, add flour, salt, paprika, and cayenne and blend well. Add milk gradually and cook until thickened, stirring constantly. Add cheese and stir over low heat until cheese is melted. Remove from heat. Add beaten egg yolks, and blend thoroughly. Fold in beaten egg whites. Pour into 1 1-2 quart Spry-coated casserole and place casserole in pan of warm water. Bake in moderate oven (350 degrees F.) 40-50 minutes. The souffle should have a golden brown crust on top. Serves 6.

CAMPFIRE TREATS

Did you ever make a kabob? They're easy and half the fun of eating them is the satisfaction you get out of making your own. Thread bite-sized pieces of meat and small bite-sized pieces of meat and small whole onions, tiny tomatoes and mushrooms on wiener forks or sharp sticks. Brush with oil or French dressing and roast over an open fire. Liver and bacon, lamb, onion and tomato or beef and mushrooms are good combinations.

SHRIMP CREOLE

2 tablespoons fat
1 teaspoon kitchen bouquet
1-4 cup finely diced onion
1-4 cup finely diced eelery
1 1-2 pounds cooked shrimp
3-4 cup catsup
1 tablespoon vinegar

Melt fat in 9-ineh frying pan.

1 large green pepper

Add kitchen bouquet and blend thoroughly. Add onions and celery and saute for 10 minutes or until golden-brown. Add shrimp. Saute over moderate heat, for five minutes. Blend together and add catsup and vinegar. Slice green pepper into one-inch pieces and add. Bring to a boil and simmer eight minutes. Taste and, add salt, if needed. Serve on hot cooked noodles.

FISH FLAKES IN RAMEKINS

2 cups cooked fish, flaked
4 tablespoons melted shortening
4 tablespoons flour
1-2 teaspoon salt
1-4 teaspoon nutmeg
2 cups top milk
1 tablespoon lemon juice
2 hard-cooked eggs, chopped
1-2 cup flaked cereal, crushed

Blend melted shortening, flour, salt, and nutmeg in a saucepan. Stir in the milk and cook until thickened. Add the fish flakes, lemon juice and eggs, place in individual oiled casseroles or custard cups, cover with crushed eereal and bake 20 minutes in a 350-degree oven. Serves 6.

POTATO SCONES CONSERVE FLOUR

Potato griddle scones—The Scottish housewife's version of a biscuit—not only serve as a quick bread with a meal, but can be used like biscuit in shortcake types of main dishes, with creamed leftover meat, fish or vegetables poured on top. The following recipe yields 5 or 6 servings.

Sift together 2 cups of sifted flour, 1 teaspoon salt, and 3 teaspoons baking powder. Cut in 3 tablespoons fat, using 2 knives or a pastry blender. Blend in 1 cup cold mashed potatoes. Mix 1 egg, beaten, with about 1-3 cup milk and add to the first mixture. Mix slightly. Roll three-eighths inch thick. adding just a little more flour, if needed. Cut into squares and bake slowly on a hot, greased griddle or frying pan. Turn several times to cook through. Makes 10 to 12 scones.

BAKED LIME TARTS

2 tbsps. shortening or butter
1-3 cup sugar
4 eggs separated
1-2 cup light corn syrup
2 tbsps. flour
3-4 cup milk
1 teasp. lime rind
1-3 cup lime juice
8 baked tart shells
Whipped cream

Cream shortening: add sugar; cream until fluffy. Add egg yolks; beat well. Add corn syrup and flour; mix thoroughly. Add milk, lime rind and juice; mix well. Beat egg whites until stiff; fold into lime mixtures. Fit pastry loosely into 8 individual tart pans or muffin pans, fill with lime mixture, bake in hot oven (400 degrees) for 45 minutes; cool. Remove from pans and garnish with whipped cream. Makes eight 2 1-4-inch tarts.

HOT CORNED BEEF AND TOMATO SANDWICHES

Toast one slice of bread to a serving, and spread lightly with butter or margerine. Cover each slice of toast with sliced corned beef; spread lightly with mustard or horseradish. On top of the meat, place tomato slices (not too thin) dipped in French dressing. Sprinkle with grated cheese. Place on rack of broiling pan, about 2 inches from the heat, and broil until the cheese is melted. Serve immediately.

VEGETABLE-CHEESE FONDUE

1 1-2 cups canned mixed vegetables
2 tablespoons table fat
1 tablespoon chopped green pepper
2 tablespoons chopped onion
1 tablespoon chopped celery
2 cups milk (scalded)
1-4 pound cheese (grated)
1-2 teaspoon salt
1-8 teaspoon pepper
1 tablespoon minced parsley
3 cups bread cubes
4 eggs

Drain vegetables from jar and measure. Melt table fat and to it add green pepper, onion and celery. Simmer until tender (about 5 minutes.) Gradually add the scalded milk, cheese, salt, pepper, parsley and mixed vegetables, stirring constantly until well blended. Put the bread cubes in a greased casserole. Add the well beaten eggs and then the sauce. Bake at 325 degrees for 40 to 45 minutes or until golden brown. Serve at once. Six servings.

BAKED EGGS AND TOMATOES

4 eggs
4 thick slices tomato
1 tablespoon chives
Salt and pepper
1 cup sour cream
Bread crumbs
Butter or margerine

In a greased baking dish place tomato slices. Poach the four eggs with crumbs, dot with butter or margerine, and bake in 400 degree oven until crumbs are brown—about 15 minutes.

MOCHA PECAN ICE CREAM

1 envelope unflavored gelatin
1-4 cup cold water
1-2 cup strong coffee
1 square chocolate
3-4 cup sugar
1-4 teaspoon salt
1 1-4 cups milk
2 cups light cream
1 1-2 teaspoons vanilla
1 cup unsalted pecans, broken.

Soften gelatin in 1-4 cup cold milk and dissolve in hot coffee. Melt chocolate over hot water and add hot coffee gradually, stirring constantly until smooth and blended. Add sugar. salt, milk, cream, and vanilla. Pour into refrigerator tray and freeze. stirring several times. until mushy. Fold in pecans and freeze until firm. Serves 6-8.

June became popular as a wedding month, because June gets its name from Juno, the faithful wife of Jupiter and the goddess of marriage.

TASTIER FISH

For broiled fish at its best, use moderate heat, placing fish about six inches away from the broiler. No extra fat is used with oily fish, but lean fish is rubbed with margerine or bacon drippings before broiling.

A pint of ice cream has been found to contain more than a milligram of vitamin G and almost half a millegram of pro-vitamin A.

HAM AND NOODLE CASSEROLE

1 1-2 cups noodles
3-4 cup grated ham
1-2 cup grated cheese
1-4 cup chopped green pepper
1-4 cup chopped celery
1 or 2 eggs
1 1-2 cups milk
1-4 teaspoon paprika
1-2 teaspoon salt

Cook noodles in briskly boiling Drain. Grease a baking dish and put a layer of noodles into it. Combine ham, cheese, green pepper and celery. Sprinkle a layer of this mixture over the noodles. Continue layering until ingredients are used up, ending with a layer of noodles on top. Beat egg or eggs slightly and combine with the milk. paprika and salt. Pour over the noodles. Cover the top with buttered crumbs and bake in 350-degree oven for an hour.

FOR A TEMPTING SUPPER PREPARED IN THE COOL OF THE MORNING

By-the-Sea Salad

Carrots and celery curls, Spiced beets, Cheese, Fresh peaches, Blue Plate Iced Coffee

How to prepare BY-THE-SEA SALAD

2 tablespoons plain gelatin
1-2 cup cold water
1-2 cup lemon juice
2 cups hot water
1 teaspoon salt
1 tablespoon sugar
2 hard boiled eggs, cut in halt
Paprika
1 cup green peas
2 cups fish, boiled and flaked (perch, haddock, salmon etc.)
2 teaspoons finely minced onion
Blue Plate Mayonnaise

Soften gelatin in eold water and dissolve in hot water. Add sugar, salt, lemon juice. Stir well. Cover bottom of mold with gelatin and chill. Sprinkle eut side of eggs with paprika. Place flat side down in mold. When remaining gelatin thickens, stir in fish, peas, and onion. Fill mold and chill till firm. Serve with generous portions of rich, creamy, Blue Plate Mayonnaise.)

How do famous chefs make mayonnaise? They use fine salad oil—blend their spices artfully—use only ehoice ingredients—whip them to velvety smoothness. And that's exactly the way the Wesson Oil people make Blue Plate Mayonnaise.

COFFEE FLUFF

Combine 3 cups warm double-strength brewed coffee with 1 1-2 cups marshmallow fluff. Beat or shake until well blended. Pour at once over cracked ice or ice cubes in tall glasses. Makes 6 to 8 servings.

FOR A WHOLESOME LUNCH YOU CAN FIX FAST

Sandwich Grill
Green Salad, Canteloupe, Blue Plate Iced Tea

How to prepare SANDWICH GRILL

Spread bread from crust to crust with smooth, easy-to-spread Blue Plate Peanut Butter. Top with slice of skinned bologna or salami, on which you place 1 tablespoon finely chopped tomato. Run under broiler till meat cups up.

If potatoes must be peeled ahead of time, they should be put in salted water. The longer they stand exposed to air, the more vitamin C. they lose. If there are left-overs, they should be kept covered and in a cold place until used.

SALMON SPAGHETTI SALAD

1 tablespoon salt
1 cup ldiced celery
3 quarts boiling water
4 bunches elbow spaghetti
2 cups flaked salmon
3 hard cookekd eggs. diced
1 cup cooked peas
1-4 cup chopped green pepper
1-2 cup salad dressing
2 tablespoons French dressing
1 tablespoon Worcestershire sauce
1 tablespoon lemon juice
1 teaspoon salt
1-8 teaspoon pepper

Add 1 tablespoon salt to actively boiling water. Gradually add spaghetti and continue boiling until spaghetti is tender (about 8 minutes). Drain and rinse with cold water. While spaghetti is cooking combine salmon, eggs, peas, celery, and green pepper. Mix salad dressing, French dressing. Worcestershire sauce, lemon juice, 1 teaspoon salt, and pepper. Combine salmon mixture spaghetti, and salad dressing. Chill well. Serve in lettuce cups. Yield: 4 servings.

Sardines are an excellent source of phosphorus and calcium.

SCALLOPED TUNA, AND POTATOES

5 medium-size cooked potatoes
1 7-ounce can tuna
1 tablespoon diced onion
1 can condensed celery soup
Paprika

Slice potatoes and flake tuna Fill greased casserole with alternate layers of potatoes, tuna, onion and celery soup until all are used. Pour the oil from tuna over mixture and sprinkle with paprika. Bake in hot oven (425 degrees.) about 30 minutes. Serves 6.

Salmon, shrimp, oysters or clams may be used instead of tuna.

Carrots are a good buy when smooth, firm and bright in color, with tops green and unwilted. Beware of deep cracks. They are usually a sign of poor quality.

HOUSEHOLD HINTS

For good circulation of air around a refrigerator, allow three or four inches space at the back and at least 10 inches above so that eondenser coils may become properly cooled.

You can starch curtains in your washer. Make a solution of one part starch to ten of water, following the instruetions on the package for making starch. Add four cups of the solution to a washer filled with warm water; Drop in the curtains, run the washer two or three minutes.

BAKING TIP

Pastry made with emergency flour tends to brown quickly during baking. Some cooks prefer baking pie shells made with this type of flour at 425 degrees, instead of the usual 450 degrees.

LEG MAKEUP REMOVER

A new liquid hosiery remover is designed to take off bottled leg make-up in a hurry. Pour the liquid into the hand, apply to legs and rub gently. Rinse with water and dry with a towel to leave the skin soft and smooth.

Learn to Make Hands an Asset To Appearance

By Antoinette Donnelly

Beautiful hands are hands that are well groomed and graceful in expression. Any hands, if they are well cared for and correctly used can be greatly admired.

So, let's go into the matter of the care of the hands. They must be kept soft and smooth. Use your favorite cream or lotion regularly. Apply it after every hand washing. If you do your own housework, use the cream or lotion more plentifully .

If your cuticle tends to be dry and your nails chip and crack easily, put plenty of oil or cream on them. Wearing and working with gloves over this protective coating will do as much good as if you sat and massaged the product into the fingers.

To promote a soft cuticle and unbreakable nails, a daily soaking in warm olive oil is beneficial Keep the fingertips immersed in the oil for a few minutes, then push back the cuticle gently and work in the oil with the fingertips

With the beauty routine taken care of, let's ponder the way you can use your hands so they will contribute to the general picture of beauty and grace.

If you are in doubt as to how to use your hands, watch yourself in a mirror. Stand in front of the mirror and pretend that you are talking to some one. Tell this make-believe person a story. Watch yourself closely. Do you tell half of the story with your hands in such a way that the listener would be distracted by watching the motions of your hands? Or, are they motionless by your sides, giving no assistance whatever?

Short, sharp and jerky motions with hands do not add to poise or grace. You must use hands slowly and lightly. Graceful hand motions, if not natural to you, demand a great deal of practice.

BUTTON TRICKS FOR FALL

Gilded plastic buttons, reproducing the coins of several countries. are among the brilliant contributions to the fall fashion picture. String several together on fine wire to make a chatelaine for your wide leather belt. Others may be tied on colored cord to make a smart coin bracelet.

Another trick with buttons: Let gleaming metal ones march double file up the front of your nipped-in-dandy suit. Sew a larger one on the shoulder to hold the strap of your over-the-shoulder bag secure from slipping.

CANNING TIP

Cooking salt is better for making pickles than is table salt because no starch has been added. Starch makes the pickling liquid cloudy.

Vacuum clean small rugs erosswise instead of lengthwise. Rugs are not as apt to wrinkle up under the cleaner.

POTATO BREAD

1 cup milk 1-2 cup boiled, riced potato, well packed
1 teaspoon salt
1-2 tablespoon fat
1 tablespoon sugar
1 cake yeast

Scald milk, add potato, salt, fat and sugar. Be sure that potato is thoroughly mixed with milk. Cool to lukewarm and add the crumbled yeast. Stir in 2 1-2 cups of flour, and mix well until blended, reserving the rest of the flour for kneading. Sprinkle kneading board liberally with reserved flour. Turn out dough on board and knead until smooth. Let rise 1 1-2 hours or until double in bulk. Punch down and let rise 1 hour. Kneed lightly, shape and let rise in pan 1 hr. bake 15 minutes at 375 degrees. Lower heat to 350 degrees and continue baking 45 minutes.

Pageantry Aids Farm Leaders In Fight on Soil Erosion

The Byrd Nest

By Rev. Bernard O. Byrd
—Guest Columnist.

Watch the Fire-Works

Many Americans have enjoyed themselves on the Fourth of July, re-enacting the scenes of the revolutionary war, by shooting fire-crackers, roman-cannons, sky-rockets, and torpedoes. While having a great deal of fun in these things, many joyful Americans, carelessly handling the fire-works brought destruction to property and injury plus death to humanity. The persons meant no harm but the fire-works didn't know it. Because of the danger of flying fire-works, every thrower should watch his cast.

The reader may say that I am late with such instruction. I admit that if it refers to physical fire-works only, I am too late for the 1946 celebration. Nevertheless I am more concerned about the fire-works of the mind and heart than about the fire-works made of powder. The tongue is against fire-crackers; and although it is lighted and thrown with no evil intent in mind, it sometimes falls into inflammable ears causing destruction of friendship, injury of reputation and death of a name. A man should never light up his tongue unless he has a safe place to throw his words.

Jealousy and Envy are roman-cannons bearing powder of meanness and balls of reflection. One shot follows the other until the supply has run out. Each report is followed by many sparkles of hatred which help to draw attention on the candle while shooting. When roman-cannon has finished its work it learns that its reward is banishment to the trash pile with a black interior.

The torpedo is a bundle of slander which begins with one person, and is thrown somewhere else to explode, thus making it appear that there is something wrong elsewhere. The trouble with the torpedo of slander is that it is hard to find out where it originated. You mostly know where it explodes. The torpedo seldom explodes with its maker.

Selfishness is a sky-rocket which takes great delight in going up, but rarely finds a place to perch. It is hard to keep selfishness from going up, but harder to keep it from coming back down. It goes up, makes a sound indicating that it has reached it height and then unnoticed, unheralded, and uninvited, it falls to the ground. The sky-rocket of egotism then has nothing to lift it up again; no, not even enough selfishness to shoot it back into the air.

Fire-works never do any good. They are seen and heard, do not bring forth anything to be utilized by others. Think of the noise that fire-crackers make and the good tongue could be converted into wisdom, it would produce power sufficient to roll the wheels of progress farther up the road. If the sparkles of the Roman-cannon of jealousy could be changed into influence, they would help many persons find the right path. If the missiles of the torpedo of scandal could be changed to advice many mistakes would never be made. If the blaze of the sky-rocket of selfishness could be charged into the eyes that

Four Negro Consultants Designated by Adm. Of Retraining And Re-employment

Four Negroes prominent in educational affairs of the Nation have been designated as consultants to the Retraining and Reemployment Administration to strengthen and advance that agency's services to minority groups in the fields of retraining, reemployment, vacational education and vocational rehabilitation, it was announced by Marine Major General Graves B. Erskine, RRA Administrator.

Three of the designations have just been made and the fourth, that of Dr. F. D. Patterson, President of Tuskegee Institute, Tuskegee, Alabama, was announced some time ago. Those just announced include:

Julian A. Thomas, New York City, Director of the Department of Industrial Relations, National Urban League, who will serve as an advisor to Shane MacCarthy, Assistant RRA Administrator in charge of the Re-employment Branch.

Lieutenant Colonel W. A. Clark, Dean of the Graduate School of Tuskegee Institute and field advisor to the Commanding General of the 7th Army Headquarters in Atlanta during World War II, who will be advisor to Robert K. Salyers, Assistant Administrator in charge of Field Service.

Dr. Ambrose Caliver, Specialist in Negro Education, U. S. Office of Education, Washington, D. C., advisor to George L. Glasheen, Assistant Administrator in charge of Retraining and Vocational Education.

The four consultants have been asked to make studies and submit data and recommendations which will assist RRA in the formulation of policies and programs of benefit to minority groups in the carrying out of its overall postwar reconversion functions.

"In our haste to replace the choice of war with the tranquility of peace, we must not overlook the welfare and well-being of those minority groups who constitute a substantial segment of our population," General Erskine said. "Any program of peacetime reconversion which does not do this will have missed the objectives for which many of our people gave

Winners of Soil Conservation Awards

DR. HUGH H. BENNETT, chief of the Soil Conservation Service of the U. S. Department of Agriculture (center), looks at a $100 check awarded to Sib Newsome, first prize winner in Georgia's Statewide soil conservation contest. Left to right, are: Dr. Benjamin F. Hubert, president of Georgia State college, father of the jamboree; William Baker, fifth prize winner; Willie G. Stewart, forth placer; Dr. Bennett, Mr. Newsome, P. H. Stone State Extension agent for Negro work; Wm. Paul Perry, second place and Thomas Skrine third prize winner.

8 Million Children To Participate In School Lunch Program This Year

Washington, D. C.: As the school bells ring this year, approximately 8,000,000 white and colored children in 48,000 schools have bright prospects of being served nutritious noonday lunches under the permanent school lunch program, the U. S. Department of Agriculture estimates. Last year 7,000,000 school children participated in the program.

Three months ago the school lunch program became permanent with the signing of the National School Lunch Act by President Truman. Committees now are no longer forced to plan their school lunch programs on an uncertain year-to-year basis, but can make long range plans for providing nutritious lunches for the pupils.

4-H Clubbers Form Co-operative Insurance Plan

The colored 4-H club boys and girls of Alabama have organized a cooperative insurance plan to protect their prized livestock, according to reports received by the U S. Department of Agriculture from the Alabama State Extension Service.

The plan was developed at a Statewide meeting of 4-H'ers at Tuskegee, July 29 August 3. After an organization—the State 4-H Club Council—had been established the boys and girls immediately took up one of the major problems facing them—protection for their club calves. Figures were presented showing the number of calves exhibited at the stock shows and the number that died each year while being raised by the 4-H'ers.

To meet this problem, the club boys and girls established and a

Unique Way Of Calling Attention To Farmer's Problem Used

Through pageantry and dramatics, colored farm leaders of Georgia are intensifying their campaign against soil erosion—the demon that robs the farmers' land and threatens to keep them poor.

In Log Cabin, Georgia, recently, the colored farmers held their first annual State-wide soil conservation jamboree to help focus attention on the need for waging constant warfare on soil erosion. The unpleasant facts about soil erosion which already has washed away most of the topsoil from 282 million acres of America's crop and grazing land were told in a dramatic skit supported by pageantry and folk dances.

Dr. Hugh H. Bennett, chief of the Soil Conservation Service of the U. S. Department of Agriculture, was the principal speaker at the jamboree. Following the awarding of $2,200 in cash prizes to farmers for outstanding soil conservation achievements, Dr. Bennett praised the farmers for the important part they are playing in the tremendous task of safeguarding the nation's soil resources.

About 500 colored farm people and 60 SCS and Extension Scrvice officials were in attendance at the jamboree which was initiated by Dr. Benjamin F. Hubert, president of Georgia State College. Last year only a county-wide jamboree was held, but this year the program expended into a State-wide festival. P. N. Stone and A. S Bacon, colorcd State Extension Service supervisors, assisted Dr. Hubert in developing the soil conservation event.

Top winner in the State-wide soil conservation contest were: Sib Newsome, a Farm Security Administration client, who received the $100 first prize award; Wm Paul Perry. a cotton and cattle

The Negro Agricultural Association of Conway County

In the meeting of Soil Conservation Community group leaders, of the Central Valley Conservation District, Conway, Co. Morrilton, Arkansas: Jessie L. Taylor, Negro Soil Conservation Assistant, explained the seasonal practices that the Soil Conservation Districts are establishing with their cooperators, and how each community group leader can assist the District in getting a better job done.

Conservationist Taylor emphasized the values that farmers and the soil will receive from full cooperation in the BLANKET OF GREEN campaign that the Soil Conservation Service and the Extension Service have on for the farmers of this State, for this Fall and Winter.

One community leader asked the Conservationist about the duties of Soil Conservation group leaders. Seventeen duties were listed and explained as to how each leader can serve his community and the Soil Conservation Service as follows:

1. Assist in calling and Conducting Meetings, Tours and Demonstrations and Encourage Neighbors to Attend.
2. Assist Supervisors in Determining Priority Work Areas.
3. Assist Supervisors in Efficiently Handling Erosion Control Equipment.
4. Assist Supervisors in Securing Applications in Your Neighborhood group.
5. Assist the Supervisors in Securing Information for Their Annual Report.
6. Assist the Supervisor in Securing the Status of Every Tract of Land in Your Group.
7. Assist in Ironing Out Difficulties Leading to Failure of Farmers to Carry Out the Plan on Their Farm.
8. Assist by Demonstrating on

Economic Opportunities for Women

New York, N. Y.—Harlem will be the scene of an intensive project to encourage and assist women to turn their crafts into cash and to set up successful small business_cs of their own, according to Mrs. Sadye J. C. Williams, president of the New York chapter of the National Association of Negro Business and Professional Women's Club and a member of the New York Woman's Council which was appointed by Governor Thomas E. Dewey to promote economic opportunities for women.

Plans to hold a "Career and Small Business Forum" at the 135th Street Branch Auditorium of the New York Public Library in Harlem, October 2nd and 9th, were formulated at a meeting of prominent local women in the Harlem area on September 16th. Economic independence was the keynote of the meeting, at which community leaders expressed the need for many attractive new shops and small businesses, and discussed wide opportunities that are open to women who are interested in commercializing their talents or running their own businesses.

The Harlem Career and Small Business Forum is one of a state wide series of forums sponsored by the New York Woman's Council under the chairmanship of Jane H. Todd. According to Miss Todd, who is also Deputy Commissioner of the New York State Department of Commerce, the Forum project is part of an official state program of economic planning and development. Through its encouragement to small businesses, the State is promoting jobs and money making opportunities for the men and women in the State. The women's angle comes under the aegis of the New York Woman's Council which includes, in addition to Mrs. Sadye Williams, President-Elect Sarah Blanding of Vassar College, Ruth Young of the CIO, Betty Hawley Donnelly of the AF of L, and other women leaders from industry, education and community volunteer organizations.

These forums are designed to assist women in developing salable products, successful merchandizing technique, and market outlets. Speakers and guest experts provide professional advice during each forum. Admission is free. As a result of the Career Forums held so far under the auspices of the New York Woman's Council, a large number of women have added to their incomes and according to Jane Todd, in many cases have become financially independent.

The first forum in the series was held last March in midtown New York City and was concerned exclusively with commercializing homemade food products. At the preliminary meeting in Harlem this week it was decided to devote two evenings to the Harlem Forum concentrating on the subjects of launching a money_maker and setting up a shop. One session will deal with the problems of producing, packaging, labeling, and merchandizing handicrafts and articles that women make themselves, which can be sold through volunteer shops and similar outlets. Another session will be devoted to diplay, publicity, financing, and other problems involved in setting up a successful shop or business.

Member of the steering committee working with Jane Todd and Mrs. Sadye Williams include: Mrs. Ruth A. Handy, President National Association of Negro Business and Professional Women's Clubs, Inc.; Mrs. Minnie D. Hurley, President, Board of Auxiliary Mother A. M. E. Z. Church; Mrs. Rose Blocker, Fraternal Organizations; Mrs. Ada Battle, President, Omicron Chapter Iota Phi Lambda Sorority; Janie B. Mapp, Vice President of Woman's Voters' Council; Mrs. Edith M. Alexander, Associate Director Mayor's Committee on Unity; Mrs. Gertrude A. Robinson, New York Chapter of Delta Theta National Council of Negro Women; Mrs. Iolanthe Sidney, Sidney's Employment Agency; Mrs. Lucille Chance, Attorney; Mrs. Corrine Thomas, President, Ivy Art Circle; Mrs. Maude B. Retailers And The Black Market

The head of a large retail trade association recently wrote Paul Porter, the present OPA administration, pledging unqualified cooperation in controlling prices. One sentence in the letter said: "Now that the Congress has spoken, the job of all of us is to join in carrying out the law."

That has been the attitude of the vast majority of established retailers, chain and independent, since price control began. A great many of these retailers differ with provision of the law and policies laid down by OPA. But, once the law goes on the books, they do everything possible to make it work.

All the talk about black markets has tended to cast an unjustified shadow over the retail industry. It is true that an enormous volume of goods moved through black market channels—and will continue to so move until supply catches up with demand. It is also true that a very small pereentage of established retail stores were ever involved in the black market tie-up. The majority of these stores sold what goods they had at legal prices— and when they couldn't get new supplies they found substitutes or left their shelves bare.

The fine record made by retailing, now and in the past, must not be obscured by the unsavory activities of the few racketeers. Your typical store isn't out to exploit the consumer.

Soil Conservation A 'Must' For Farmers Of The South

Better health, better education, and better opportunities will come to the white and colored farmers of the South with the application of improved soil conservation practices, says former Governor Sam Jones of Louisiana, in an article appearing in a recent issue of the U. S. Department of Agriculture publication, **Soil Conservation**

"Depite our obvious dependence on the land for our very existence," says the former **Louisiana** governor, "this nation as **a whole** is seeing its soil material washed at the rate of three billion dollars and blown away through erosion a year. At least 500 million dollars in soil is being washed from the states of the South into the Gulf of Mexico each year.

Pointing to the low standard of living on the farm, former Governor Jones says that before the war Louisian farmers averaged only $186 a year in cash income. Continuing, he said "Louisiana was no exception_____the average income of the South's people as a whole was $25 per capita per month, the cash income of our owner farmers was $15.50 a month, and of our tenant farmers, _6.25 a month."

The former governor also states that before the war 30 percent of the Louisiana farms had no milk cows, 27 percent had no hogs, 10 percent no gardens, and 11 percent, no chickens. And he says that the state was importing 50 million dollars worth of livestock and seven million dollars worth of poultry that could have been produced by Louisiana farmers.

However, he says that the situation is changing. "Already we have the most complete soil conservation set_up in the nation." We are wiping our deficiencies in live stock, says the former governor. "In 1941 we had no agricultural lime plants and we placed only 10,000 tons of lime on all Louisiana farms. In 1944 we had three lime plants in operation and placed 300,000 tons of lime on our farms and pastures. We need three million acres of improved pastures."

Dr. Buck's Effective Weapon Against Bang's Disease Lauded

By Frank Carey

Washington, Sept. 23—(AP)—It was a great day for veterinary science and for the cattle industry when Dr. John M. Buck met up with a cow named "Victor's Lady Matilda."

The late Dr. Buck, a veterinarian in the Department of Agriculture's Bureau of Animal Industry, was responsible for development of an effective weapon against Bang's disease or "infectious abortion," one of the worst of cattle plagues.

The disease, also called brucellosis is transmissible to man as undulant fever.

Victor's Lady Matilda was a famn_colored Jersey which furnished Buck with just the right strain of Brucellosis germ eulture to produce a vaccine. Long and repeated tests with other cows had proved unavailing. The vaccine was released to cattle raisers just before war began.

Any aid against Bang's disease was important in wartime because this malady was a saboteur of meat and milk production. It is estimated that it still costs the United States one fifth its potential milk supply.

Government veterinary authorities recommend that the vaccine be used only on calves between four and eight months of age.

During the war years, between 15,000 and 20,000 calves were vaccinated each month in this country.

Among countries which received quantities of vaccine material during the war was Italy. The American Veterinary Medieal Association said at the time:

"Widespread vaccination of Italian calves is also expected to curtail risk of human undulant fever, as most of that nation's milk supply is consumed without pasteurization."

Veterinarians say that calfhood vaccination is no substitute for sound **sanitation** and herd man_**agement and for regular systema**tic **bloodtesting** or nerds to eliminate susceptible adults.

But the American Veterinary Medical Association says:

"Certainly, Dr. Buck and Matilda, the Jersey cow, gave us an instrument that is of inestimable value in fighting the disease."

Recently two researchers at New York State Veterinary College reported "encouraging" results from experiments using the newly_developed drug streptomycin against brucellosis induced in Guinea pigs.

Another development in veterinary science—achieved entirely during the war—is a technique which Army "vets" believe will prevent "Moon Blindness" in horses and mules.

Scientifically known as "Periodic Ophthalmia," the malady results in a loss of more than $17,000,000 a year to American horsemen. It has been called "Moon Blindness" because of an ancient supersition that it was due to changes in the moon.

There is no known cure for the malady, which is marked by complete or partial blindness.

But researchers of the Army's Veterinary Corps at Front Royal, Va., indicated that a deficiency of riboflavin (Vitamin B_2) is involved and that the illness may be prevented by supplementing the usual horse ration with small amounts of the vitamin.

Army "vets" **also have develop**ed a new anesthetic for horses. It's described as offering a new safety factor in the virtual elimination of kicking and floundering which often accompany a horse's reaction to an anesthetic. Injuries to both animals and operators have resulted from such antics.

Developed at Fort Riley, Kans., the anesthetic is made by adding pentobarbital sodium to the solution already commonly used as anesthetic for horses. The latter solution is based on choral hydrate ("knock_out" drops) and magnesium sulfate.

We never used to be able to find grandma's glasses, but now she leaves them just where she empties them.

Lewis County Making Corn Fertilizer Tests

By O. R. Holley,

Assistant County Agent, Lewis County

The first successful attempt of the English to grow corn in North America was in Virginia in 1609.

When Columbus discovered America in 1492, he marvelled at the strange grain which the Indians called "maize." Squanto, the Indian chief, who taught the Pilgrims how to grow corn, symbolizes the passing of the new world's greatest crop into the hands of the white race. The Indians also grew squash, pumpkins, cucumbers and melons.

"No other crop is distributed over so large an area, and only one other, wheat, occupies a large acreage. The Russians have more than 8,000 varieties. The number af leaves varies from eight to 48, the height of stalk from less than two feet to more than 20, and the number of stalks produced from a single seed ranges from one to 12. Size of ear varies from the diminutive ears of some of the popcorn varieties, which are no larger than a man's thumb, to the gigantic corn growing in the Jala Valley of Mexico, which produces ears measuring, with the shucks still attached, three feet in length and stalks so tall that the ears may be harvested from horseback, and so stiff and strong that they are sometimes used for pickets in stockade enelosures for domestie animals,"—Texas Station Monograph.

A century ago Tennessee was the leading corn_produeing state with a crop of 3,000,000 bushels. Iowa wasn't even listed. Today, Iowa leads with 600,000,000 while Tennessee has 60,000,000.

Corn is the staff of life of 90 per cent of the native Mexican people In the South most of the older people can remember when in time of adversity eorn bread was eaten three times a day and wheat bis**cuits were a** delicacy for Sunday **breakfast and** when the preacher **or** other **distinguished** company **came.**

It appears that the Indians used fish, shells and ashes as fertilizer for their crops. One writer said it took about a thousand fish to fertilize an acre of corn, placing one fish in each hill. Without fish no corn was planted.

Do heavy applications of commercial fertilizer to corn cause the corn to "fire-up," or the lower blades to dry up prematurely? This question has been argued pro and con probably ever since commercial fertilizers have been used. The Purdue Station, in their tests, found heavy fertilization, particularly with nitrogen, kept eorn green longer.

There are four corn fertlizer tests now in progress in Lewis County, the results from which probably will answer this and other difficult questions. These demonstrations are on the farms of Luther Baxter of Buffalo Valley, Horace Lawson on Linden Road, H. McCord on Cane Creek and the Rev. B. F. Webb of Rlondy. Each test plot consists of one acre. Early last spring soil samples from each of these plots were sent to the Soils Testing Laboratory at Nashville for analysis and recommendations as to lime and fertilizer needs and they were followed. Each plot was planted with Tennessee hybrid No. 10 seed. Unfertilized check plots were left in **each** demonstration. The cultivation of the plots was shallow and as nearly as possible on the level and no suckers were pulled so tests would be uniform. Anyway, for economical production, should suckers be pulled off? When small boys, some of us would have been happy to have known the findings of the Nebraska Station, which was that pulling off the suckers reduced the crop yield.

Several years ago the UT Agricultural Experiment Station predicted that the corn yields could be increased 25 per cent or more by the use of better adapted seed. Neal's Paymaster, developed by the late W. H. Neal at Lebanon more than 30 years ago, has been for many years the leading variety of open-pollinated corn in Tennessee. Several years ago this variety was said to have been worth more than a million dollars to the farmers of the state because of its increased yields. However, this forecast has been more than fulfilled by the advent of the double-double cross hybrid seed. The increased use of double-hybrid seed. The increased use of double_hybrid seed corn has been spectacular, so much so, that more than 90 per cent of the crop grew in the Corn Belt last year was double_cross hybrids. G. H. Snell at Cold Spring Hargor, Long Island, and E. M. East at Illinois and later at Connecticut, working independently, perfected methods which made commercial hybrid corn possible in 1905. Henry A. Wallace of Iowa was one of the first to become interested in the commercial possibilities of hybrid corn.

Probably the weakest link in corn production is fertilization. Therefore, the fertilizer tests were amply justified. Experiments in this and other southern states have given proof that 75 to 100 bushels of corn could be grown economically on many southern soils when all the approved practices were carried out together with adequate fertilization. The Perdue Station found that the following nutrients are needed to make ears and stover for -100_bushels corn erop; 120 lbs. nitrogen (N), 45 lbs. phosphate (P2O5), 100 lbs, potash (K2O) 30 lbs Caleium (CaO), 30 lbs. magnesium (MgO), 50 lbs. sulphur (S), traces of other minor elements, and 20 to 30 inches of rain per year. The moisture supply is frequently the first limiting factor on sandy soils and where the soils are low in organic matter (humus).

Many units and area_test demonstration farmers of the state have received greatly increased yields of eorn from the applications of ammonium nitrate and nitrate of soda while others have received no response whatever in fields where heavy green manure crops (crimson clover and hairy vetch) have been turned under just preceding the corn crop.

Corn is a heavy feeder, using large quantities of plantfoods, especially nitrogen. Chemists estimate there are about 35,000 tons of nitrogen in the air above each acre of land. The crimson, vetch and other legumes, by means of tiny bacteria, succeed in trapping in the soil immense quantities of this precious plantfood. The crimson and vetch not only add large quantities of nitrogen to the soil, but when turned as green manure crops, they also add organic matter (humus) which holds moisture. Lack of soil moisture and nitrogen hunger are probably the two most important factors which keep our crop yields low.

Solving The Health Problem

The state of Oregon offers an excellent example of how voluntary medical insurance plans, conducted at low cost and free of governmental red tape, can solve most of a commonwealth's health problems.

The Oregon Physicians' Service recently announced that it had extended its activities to 15 of the state's 36 counties. Many of those counties are small in population, and are principally agricultural. The system used is sponsored by the Oregon State Medical Society and fully meets the high standards set by the American Medical Association's council on medical service. It is planned to extend the service to more counties in the state as rapidly as local medical groups approve it.

Purpose of the Oregon Physicians' Service is to offer the public more and better medical treatment than would be possible under any scheme for "political medicine." As 95 per cent of all doctors in Oregon cooperate, each client may choose his physicians, surgeons and consulting specialists—something that would not be the case under socialized medicine. Workers covered by the plan may extend surgical and hospital coverage to their entire families. The cost is extremely moderate: $2.00 per month for a spouse, $1.35 for one child, 75 cents for a second child and 50 cents for a third child. Additional children receive the same care without charge.

Other states have similar voluntary plans. They represent the soundest and least expensive solution yet proposed to the health problem.

Road To Inflation

Apologists for continued deficit spending by the government often argue that the goal of a balanced budget is defeated by the magnitude of appropriations for the armed forces. The appropriations, due to the cost of occupying conquered countries and maintaining adequate strength for defense, are at record peacetime levels.

This argument, however, will not convince anyone who takes even a cursory glance at some of the appropriations bills which were approved by the last Congress and will come up for consideration by the next. Bureau after bureau, whose need for existence is highly dubious, is getting as much as it ever did. The appropriation for OPA, though its activities are to be steadily curtailed during the coming year, was not far from its wartime level. We've appropriated hundreds of millions for unnecessary dams, and current proposals would run the cost to stratospheric levels. We are continuing to support in style such agencies as the REA, in spite of the fact that the private, taxpaying electric utilities are able to do the job, and are now embarking on the most ambitious rural electrification program in history.

Government income this year will reach the astonishing total of some $40,000,000,000. Never in peacetime history have revenues come within shouting distance of that. And yet, according to the spenders, we can't live within that income. We're in a boom period—yet we must prime the pump forever, while the national debt goes sailing upward. What will happen to the nation in a slump?

Government itself is paving the road to inflation—real and severe inflation. This is the road to eventual collopse of our fiscal and monetary system. Will we follow it?

Wheat Insurance Deadline Set

It is still not too late to insure your 1947 wheat crop through the Federal Crop Insurance Corporation, Howard Allen, administrative assistant of the PMA, said today.

He reminded, however, that September 28 was the closing date for growers to file their applications for the protection and suggested that the growers go to their local AAA office before that date if they were not contacted by an agent of the corporation.

Out of the 2,500 growers who had protection on their 1946 wheat crop almost 450 claims, totaling more than 12,000 bushels, have been made. Allen said the corporation will make payment on the claims totaling almost $25,000. This would have been the amount the farmers would have lost had they not carried the protection.

To date 3,500 wheat growers in the State have insurance on their next year's crop. However, that number represents only about 25 per cent of the total number of wheat farmers.

Allen said the average cost for all risk protection was less than six tenths of a bushel of wheat per acre. The Federal Crop Insurance Corporation is a farmers' cooperative sponsored by the Federal Government.

Clean Orchards Now To Curb Bitter Rot

"Clean orchards clean" to help eliminate apple bitter rot is the advice U_T Extension plant pathologists are giving fruit growers. The primary source of disease carry-over is mummied fruit left hanging on the tree; hence now is the time to strip affected trees while the fruit can be seen.

Apple bitter rot is a serious disease in some orchards of Tennessee, it is severe this season as in many past years, thus affording an unusual opportunity to make a long stride in eliminating this trouble. A thorough stripping is especially important in orchards where the disease has been taking a heavy toll.

It is recommended that especial pains be taken to make a clean sweep at harvest which will help materially in cleaning up later, and which will facilitate next year's spray program in giving effective control.

Oil For National Emergencies

It has been urged that, in the interest of national defense is come future emergency, the government should take over certain oil fields, and that government, rather than the private oil industry, develop oil in public lands. These ideas are often accompanied by the additional suggestion that an enormous quantity of cured oil and oil-products be stored indefinitely in preparation for the possible emergency.

This whole plan is in contradiction to the lessons of history. Emergencies are met by aggressive industries. That was true in the last two wars. The very cost and mechanics of storage make it unfeasible to keep an adequate emergency supply on hand at all times. And it is not necessary to have large supplies on hand so long as the industry in question is able to immediately step up production to meet whatever need arises.

There will never be a shortage of oil for national defense. The reserves for that purpose, as one authority puts it, "will comprise all the oil of the entire nation and owned by all the citizens." When emergencies come, in other words, the government takes all that it needs and what is left must suffice for the rest of us. And to "lock_up" or freeze reserves under government ownership or control would endanger emergency by hampering the producing industry at a time when it would otherwise be developing, conserving and exploring old and new oil lands and mapping reserves to serve coming generations.

Oil consumption during World War II was unprecedented—but we never lacked for a single barrel. Better techniques minimized waste and loss, and kept our reserve supplies at adequate levels. Should another emergency occur, the oil industry, if it is left free of government restrictions which destroy initiative, will do whatever job is given to it.

Read These Figures

Our disgraceful fire loss record continues to worsen. According to the National Board of Fire Underwriters, estimated losses for July totalled nearly $41,000,000—an increase of 20 per cent over the same month last year. This was a new high record for the month.

Our bill for waste by fire for the first seven months of the year stands at the stupendous figures of $338,304,000. That is more than was recorded in any entire year from 1933 through 1942. And losses for the 12-month period ending July 31 amount to well over half a billion dollars.

Read those figures again. Try to visualize them in terms of homes, businesses, product, labor savings. Think for a moment of the 10,000 lives that fire destroys each year—a total which may be well exceeded in 1946 if present carelessness continues. Then ask yourself if you, because of ignorance, careless ness or just plain inertia have been responsible for part of the loss—or may be responsible for part of the loss that will occur next month or next year.

Fire prevention is very largely an individual matter. It's up to the homeowner, the businessman, the employe—in short, it's up to you. It's your problem just as much as it's anyone else's problem. And your property and your life are involved.

This year, due to the record loss, efforts to make us conscious of what is happening will be redoubled during Fire Prevention Week. If we are to lick fire, we must think of fire and fight fire every week of the year.

Negro Farmer Produces This Year's First Bale Of Cotton In His County

Ernest Harris, colored farmer of Houston County, Texas, produced and ginned on August 10 the first bale of cotton of the season for his county. The bale, which weighed 470 pounds and brought $250, was placed on display in the lobby of the First National Bank of Crockett.

Glad To Be Back

An ex GI. observed the way "the other half" lives in his travels around the world. Ex_Sergeant Wm. T. Garvey saw what any G. I. could have seen who passed thru the cities of the Orient enroute to "the bush"—India's beggars; cows ambling nonchalantly along sidewalks; Mohammedans turning to Mecca; the painted marks of religion and caste; the roadside vendors of insect_ridden cheese and fruit, shoe laces and worthless trinkets; the haggling over price of wares; the smells, scarcity of food of any sort; the ragged thousands sleeping the clock around on the floor in any public building or railway station; clothing beaten to shreds on thousands of staggering skeletons flat rocks in lieu of washing; waiting something to eat.

It is no mystery to him why living standards are so low in these countries. Methods employed in gaining a livelihood in such countries are still so primitive that men can barely produce enough to keep alive, whereas in America, capital has built up great industries which make the United States a land of luxuries. Few, indeed, are the locations outside America where people take for granted automobiles, radios, refrigerators, bathtubs, washing machines, vacuum cleaners, sewing machines, telephones, electricity, gas, fresh running water and modern sewage disposal.

India can't duplicate what we have in America overnight, "because capitalism requires saving. To enjoy greater comforts at a later date," the soldier explains," we must forego some of the satisfaction of the present. By pooling our savings with others we can purchase production equipment beyond our means as individuals, and produce consumer goods cheaply and in quantity. In India capitalism is just in the beginning.

"I like our American system. I like my radio and electric refrigerator, an extra suit of clothes, and meat on the table. I was never impressed by the street corner propagandist who was always trying to prove that the "capitalists' were oppressors grinding a heel on the neck of downtrodden common people. There was a time when I used to think that they didn't know what they were talking about. Now I know. Of course there are abuses of the capitalistic system, but I've seen how 'the other half' lives. I'm back home and glad of it. I like it here."

FARM FIRES COUNT HEAVILY AMONG LOSSES

While fires which take several lives at once make the headlines, countless isolated fires add up heavily in the nation's increasing fire loss of life and property. Extension specialists at the U. T. College of Agriculture said today. This is especially emphasized this year, when losses in the first half of the year amounted to more than the yearly loss in eight years of the last fourteen.

Farm fire prevention is a subject which should be discussed at any rural group meeting, specialists pointed out, with special attention to the eliminating hazards during Fire Prevention Week, Oct. 6-12. A farm or home inspection list can be obtained against which to check individual farms. Church and school groups are also urged to do their part in reducing preventable fires. Figures show that on an average, seven school buildings catch fire every day during the school year, and there are 42 church fires every week.

The best defense against fire anywhere is (1) keeping it from starting; and (2) putting it out while it is small. Simple measures are often effective, as for example, provision of a strong, lightweight ladder for quick use in case of trouble. Plain "good housekeeping" such as this will help in many situations.

The most common cause of fire in farm dwellings is the defective chimney, including flues and stove pipe connections. Before cool weather comes, these should be cleaned thoroughly. In addition, a check should be made for cracks, or loose mortar.

Some folks give according to their means, and some according to to their meanness.

—George Eliot

"Sieg Heil!"

Opportunity Offered

When Eric A. Johnson gave his farewell address upon his retirement as president of the Chamber of Commerce of the United States, he emphasized the importance of capitalism encouraging greater opportunity for all, and added that there can be no equal opportunity without fair competition. He defined competition as that which provides opportunity for ideas, for leadership, for thinking. It holds prices at reasonable levels and makes for better living.

The National Retail Dry Goods Association recently held its first Retailer_Veteran Conference in Altoona, Pa. During this meeting the merchandizing craft was discussed. It is the intention of the Association to hold similar meeting throughout the country, in order to aid veterans who wish to enter the distinctive field, either with some company or in their own stores. Veterans will be able under this arrangement to discuss practically any phase of retailing and receive instruction and advice from experts.

The Association is carrying out the very thing the retiring. Chamber of Commerce president pointed out as vital in the preservation of capitalism. True capitalization.

Choose Breed You Like, Expert Tells Stockmen

Choosing the best breed of cattle, hogs or sheep is a simple matter: the best breed is the one of your choice, Dr. J. C. Miller, head of the Animal Husbandry Department UT College of Agriculture, said to day.

The breed is of relatively little importance if one has no preference. Dr. Miller said. Each breed has certain outstanding points and each differs in some respects under different systems of management. To that extent, it is best to select the breed most likely to respond best under the management system to be used. In any case, if the livestock raiser is breeding grade animals, he should choose one breed and stick to it.

Three fundamental considerations in the selection of breeding animals are individuality of the animal in question; its ancestry, and its offspring. In the case of beef breeding animals, Dr. Miller recommended attention to these five points:

Breed and sex character; constitution; early maturity; natural fleshing, and quality. There are other details which should be considered in selection of beef animals, but these outweigh all others.

Kentucky Barley Growers Favor Marketing Plan

Louisville, Ky., Sept. 23—(AP)—Burley tobacco growers in 43 Kentucky counties have voted in favor of the four-point burley marketing program recommended by the burley growers steering committee and grower delegates from 71 Kentucky counties and five states.

In announcing the program's approval by the growers, Horace Cleveland of Pleasureville, chairman of the steering committee, said the remaining counties have not held meetings to vote on the program.

The program calls for:

1. A strong, active, area-wide cooperative tobacco marketing association.

2. A sound, workable production control program.

3. Expansion of market outlets for tobacco and tobacco products.

4. The maintenance of reasonable marketing costs.

Growers in each burley producing county in Kentucky voted Saturday on county delegates who meet today to select a member of the board of directors of the Burley Tobacco Growers Cooperative Association, Cleveland announced.

The next meeting of the steering committee is set for tomorrow at Lexington.

White County Farmers Receive AAA Payment

A report released recently by the White County AAA committee showed that farmers in that county received $138,928 in payment from the AAA for soil conservation practices carried out in 1945.

The report showed the farmers applied 19,616 tons of lime, 3,218 tons of phosphate, 900 tons of basic slag, seeded 14,272 acres of winter cover crops, and harvested 163,417 pounds of crimson clover seed.

In addition to receiving approximately $139,000 for soil building payments the farmers were paid $38,147 in dairy production payments and $450 ir beef and sheep subsidy payment.

The committee's report further showed that payments received by the farmers through the AAA amounted to almost four times the total farm taxes for the county.

The White County committee is composed of C. E. Crooks, chairman; W. L. Sullivan, Albert V. Fraser and County Agent H. W. Andrews, W. T. Watson is chief clerk.

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.

Your Own Farm the Feasibility of Practices As Planned.

9. Assist in Stopping Unfound Rumors and Misinformation by District and its Program from First Hand Sources.

10. Encourage Adjustments in Type of Farming and Farming Practices That Will Insure Good Soil Conserving Practices.

11. Encourage the use of a flexible Farm Lease that will Improve the tenure of eaeh cash and share tenant so they are willing and able to etstablish permanent control practices.

12. Encourage each farmer in your group to earn all his AAA Soil Building allowanee with the use of and the need of permanent practices.

13. Assist the Supervisors in securing the services of other ageneies of the State and Federal Government in carrying out the District Program.

14. Assist your neighbors by routing all their requests for any kind of assistance in carrying out their farm plans, to the District Office.

15. Assist by becoming efficient in establishing conservation practices so you ean give your neighbor the proper information or show them how to establish certain practices, thereby saving the District employees many contacts enabling them to serve more cooperators.

16. Assist by giving the local papers stories about the accomplishments in your group.

17. Assist the Supervisors in providing information to keep the work program up to date.

Zelma M. English, Reporter.

look inwardly, like Robert Burns said, "It would from many a blunder free us, and foolish notion."

All the Fire-crackers, Romancannons, Torpedos, and Sky-rockets were not shot up on the fourth of July, there are some near you. Take the writer's advice, and watch the fire-works.

It is better to be wise than foolish, but it is better still to be good than bad.

Unique Way Of

(Continued From Page 1)

farmer, who was awarded $50 as second plaee; and Thomas Skrine, a dairy farmer, who received $40 as third place winner for the State and $72 in county and community prizes.

Dr. Bennett, who posed for a pieture with the winners, told the farmers in his address that the Log Cabin jamboree is one more outstanding proof that the farmers and ranchers of the country are making long strides along the road to real, sound soil conservation and better living.

Continuing, he said, "Poor land makes poor people—people with empty pocketbooks and empty stomachs, living empty lives. Soil erosion is the surest and quickest way to make land poor—and yourselves poor along with it."

Turning to the nutritional aspeets of soil conservation, Dr. Bennett declared, "many authorities agree that the fertility of the land has a lot to do with food value, or lack of it, of crops grown on a given piece of land. We know, too, that in the past all the many people right here in the United States have not had enough of the right kind of food to eat all through their lives. It is especially significant that these conditions have existed more generally in those areas where the land had been 'farmed to death' and the top-soil had washed off into the creeks and rivers."

The Soil Conservation chief pointed out that increasingly colored technicians are being employed to assist colored farmers with their soil conservation problems. "There are nearly 50 Negro teehnicians on the Soil Conservation Serviee staff here in the southeastern region alone," Dr. Bennett said.

The soil conservation jamboree may soon be expanded into a South-wide event, according to Dr. Hubert, who has been interested in an effective soil conservation program for a number of years. Originally, he was interested primarily in helping his neighbors in Logg Cabin to maintain the fertility of their 28,000 acres in Hancock county.

How, he plans developing the jamboree into a South-wide festival. He believes that through sound soil conservation practices, many tenants and sharecroppers, who now are threatened by mechanization, may be able to survive the meehanical cotton picker by shifting their improved land from cotton to food and food crops.

Four Negro

their lives on the field of battle in two great wars of our generation. namely to preserve our way of life, and to assure for us all complete freedom of thought and action

"The Retraining and Reemployment Administration has been charged with the responsibility of directing and supervising the activities of Federal agencies relating to retraining, reemployment, vocational education and vocational rehabilitation, in order to eliminate duplication and overlapping. Obviously, it was intended that during this period of reconversion the aetivities in these four fields should not only be worthwhile and effective, but also of benefit to all of the people as well.

"Accordingly, through the designation of these four eonsultants, who possess the very highest degree of ability and intelligence, and who, I am sure, can assist us materially in the execution of our responsibility to the people of their race, the Retraining and Reemployment Administration feels that it will be in a better position to further the attainment of the goals of human reconversion which Congress had in mind in enactment of the general program of peacetime readjustment."

Statement Of Ownership

The MODERN FARMER as required by the Act of Congress, Aug. 24, 1912, State of Tennessee
County of Davidson.

Personally appeared before me, a Notary Public in and for the State of Tennessee, County of Davidson, S. B. Wilson, who having been duly sworn according to law deposes and says that she is the Business Manager of the MODERN FARMER and the following is to her knowledge and belief, a true statement of the Ownership, Management, etc., of the said publication for the date sworn in the above caption requested by the Act of Congress, August 24th 1912, embodied in section 443 Post Office laws and regulations:

1. That the name and address of the publisher is Giles A. Hubert Nashville, Tenn., and business manager of the MODERN FARMER is Nashville, Tenn., S. B. Wilson.

2. That the owners are Henry Allen Boyd and S. B. Wilson both of Nashville, Tennessee.

3. That there are no known bonds, mortgages or other security holders or owners holding 1 per cent or more and that there are no bonds, mortgages or other securities on the corporation.

(Signed) SADIE B. WILSON
Sworn before me this 20th day of September 1946
R. B. J. Campbell, Notary Public
My commission expires October 7, 1947.

8 Million Children To

(Continued from page 1)

Congress has appropriated 75 million dollars to help carry out this year's program. This compares with only $57,500,000 in 1945. Up to $10,000, 000 of this year's appropriation may be spent for school lunch equipment refrigerators, stoves, dishes, dish washing machine and other facilities.

The $75,000,000 will be divided among the States on the basis of need and the number of school children between the ages of 5 and 17. Already 43 States and Hawaii have signed agreements to take advantage of the School Lunch Act.

Through 1950, the Federal government will match State contributions dollar for dollar. For those States in which the average income is below the national average, the Federal contribution will be proportionately inereased.

Food and labor supplied by the schools and the lunch sponsors may be counted as part of the State's contribtion. However, all Federal monies must be spent for food, except of course, the $10,000, allowed for equipment.

Lunches are to conform to standards set up by the U. S. Department of Agriculture. As formerly, there will be three types of lunches for which States may claim reimbursement: Type A, a complete lunch with a halfpint of whole milk; type B, soup, or salad, or a sandwich with a half-pint of milk; and type C, consisting of a half pint of whole milk only. Maximum reimbursements for type A is 9 cents, type B, 6 cents, and for type C, 2 cents.

No pupil may be discriminated against for his inability to pay for the lunch. Children receiving free lunches are not to be seated separately, nor is any distinction to be made.

Department of Agriculture officials point out that school lunches serve a double barrelled purpose: (1) provide an additional outlet for farm products and (2) make the important contribution of safeguarding the wellbeing of the nation's children. Reports show that pupils who have received school lunches have gained in health and improved in scholarship. Absence of pupils due to illness also has been reduced in many cases.

Communities wishing to parti-cipate in the school lunch program should confer with the State Board of Education or the State office of the Production and Marketing Administration.

He was more than a humorist who said, "Our women have become fur-bearing animals."

Plan Now

To be as careful with fire as you tell others to be. Fall, with its dry leaves and dead grass, always brings an increased number of fires caused by careless hunters and picnickers.

To support your school in all of its, activities. educational as well as recreational.

To be one of the many farmers who is protecting his farm during the winter with cover crops.

To put a ring in the pigs nose before they root up some of the new alfalfa.

To insure your wheat crop before September 28.

To treat all peach trees for peach tree boars before the weather becomes too cool for the chemicals to be effective.

To have fewer garden inseets next year by cleaning away all vegetation in and about the garden that might offer winter quarters for the insects.

To insure your home and barns against fires by moving all fire hazards from within and without.

To have a farm workshop next year. Many items are becoming available which will prove both time and money-savers in a farm workshop.

To join the 4-H Club members in their drive against rats. Rats cost American farmers millions of dollars annually.

To rid the barn of rats before the new crop of corn is harvested. The job will be more difficult after the corn is in the crib.

To check the family supply of stored potatoes. One rotten potato in a box or bag now might cause the loss of a greater part of the other potatoes.

To allow no one to hunt on your farm, day or night, unless you are with them.

To provide feed boxes and troughs that will not leak feed. Grain is far too expensive to waste.

To remove all mummy peaches from and about the trees. This will help to reduce "Orchard trouble" next year.

Individual feeding of dairy cows is as important as running to capacity any other production machinery.

4-H Clubbers Form

(Continued From Page 1)

dopted a cooperative program to insure their ealves. Dr. J. R. Otis, State Extension leader for Negro work, says that 4-H club boys and girls will exhibit about 400 calves at the fat stock shows in the State next April.

Dodd Favors World Program For Assuring Adequate Food Supply

Under Secretary of Agriculture Norris E. Dodd, U. S. Delegate to the Food and Agriculture Organization conference now in session in Copenhagen, Denmark, had told the conference that the United States favors the establishment of an FAO commission to help stabilize agrieultural prices at levels that will assure improved nutrition throughout the world.

"Reeurring famines and undernutrition, along with food surpluses, have always been a part of world history, and wars have aggravated these problems," said Dodd.

"In the face of the serious problems of the moment and of the future, it is imperative that the governments of the world plan now for the protection of producers and for better nutrition for consumers.

"We are all familiar with the surpluses and hunger of the 1930's. Even today, in the midst of a world food emergency there are those who fear increased food proauetion because of its possible future effects. At the same time, we recognized that agricultural production must be inereased if the people of the world are to have an adequate diet. This condition is not new but it is a paradox whieh the world can no longer afford. The solution to this problem will be essential to securing a lasting peace and greater well being.

"We are, therefore, strongly in favor of the general objectives laid down by Sir. John Orr. In order to work out a plan for the achievement of these objectives, we recommend the establishment of an FAO commission to work out in detail an international program for the stabilization of agricultural prices at levels which will be fair to producers and consumers and whieh will bring about the improvement of nutrition throughout the world."

Set Cotton Picking Wage Rates

The U. S. Department of Agriculture has announced maximum wage rates for eotton picking in 19 counties in the Delta area of Mississippi. The rate is $2.60 per hundred pounds of cotton picked as compared with last seasons rate of 52.10 per hundredweight. The new rate became effective on September 9. Wage ceilings are also in effect in California and Arizona. In the former the rate is $2.65. Negotiations are underway in California to increase the rate to $2.65 per hundredweight.

A 9,171,000 bale cotton crop for the United States is forecast for this year by the Crop Reporting Board of the Department. This is 119,000 bales, or 1.3 percent less than the August 1 forecast. Last year production totaled only 9,015,000 bales as compared with the 1935-44 average of 12,553,000 bales.

Abandonment of cotton crops since July is expected to total 2.9 per cent or about a half million acres. This leaves 17,775,000 acres for harvest, only 500,000 acres more than last year's 17,241,000 acres, smallest since 1884.

The price of Middling 15-16 inch cotton at the ten spot markets was 36.04 cents per pound on August 9—highest since the early 20's.

On July 31, Secretary Anderson announced that under the 1946 eotton loan program, the average loan rate for 7-8 inch cotton (gross weight) will be 22.83 cents per pound—92 1-2 percent of the August 1 parity price.

Cotton mill consumption of all kinds of cotton during the 1945-46 marketing season was reported by the Bureau of the Census on August 21 at 9,200,000 bales, or 400,000 bales less than cotton consumption during the 1944-46 season.

Safety In The Coal Mines

In the long article in the Saturday Evening Post, Elsie McCormick discusses the problem of safety in the nation's coal mines. It is a story of great achievement-by operators, unions and the United States Bureau of Mines—and it points as well to additional safety work that remains to be done.

The mining of coal is basically one of the more dangerous occupations. The hazards of explosions, fires and cave-ins are always present. The problem is to cut the risk to the absolute minimum. The uninformed belief that the operators are indifferent to this is thoroughly disproved by Miss McCormick's survey. She writes: "More than 100 different safety devices and methods have been introduced into American coal mines during the past two decades, at a cost to the operators of more than $100,000,000."

Workers themselves, strange as it may seem, have often blocked essential safety regulations. For instance, operators establish no smoking rules in gassy mines—but some miners apparently feeling their personal rights are being infringed, smoke anyway. The result is unnecessary accidents, and more names on the roster of miners who died violently. In one case, miners refused to wear hard safety hats furnished by the management, on the grounds they might damage their hair—and this was in an industry where rock falls are a major cause of death and injury.

The accident rate runs high in very small coal mines of the "marginal" type. By far the greatest progress has been made by the larger operators.

All in all, the record is an encouraging one. New devices and techniques are constantly being tried, and once they prove their worth, become standard practice. No industry has had a tougher safety problem—and none is working harder to solve it.

FAO Conference

The Food and Agriculture Organization conference got underway in Copenhagen, Denmark, on September 2. It is expected to last about two weeks.

The American delegation includes N. E. Dodd, Under Secretary of Agriculture who is this country's member to the conference; L. A. Wheeler, Director of the Office of Foreign Agriculture Relations of the U. S. Department of Agriculture, who is the deputy member; Keith Himebaugh, USDA Director of Information, who is Mr. Dodd's special assistant; and a corp of adviers and ecretaries.

Among the problem which may be considered by the delegations from 42 countries will be: (1) Proposals for a long-term international food program aimed at preventing both shortages and surpluses of food and other farm products; (2) a comprehensive world food survey based on information from 70 countries; (3) a draft agreement and the United Nations; and (4) a covering relations between FAO development plan for forestry and forest products.,

Upward, Ever Upward

There are reports that labor leaders are planning on a drive for widespread additional wage increases. The reports say further that many senators and representatives, who must run for reelection in November, will back them.

Here is the one sure road to ruinous inflation, and the destruction of the dollar. When will labor learn that wage increases without any comparable increase in worker productivity will simply result in more price increases—and a decline in "take home" pay? When will our lawmakers realize that the playing of politics at the expense of the very financial structure of the country will bring distress and ruin to us all?

HERE AND THERE

Lamartine once said, "With a free press government may be difficult; without it, it is impossible."

Prices And The Free Market

Writing in the New York Times, Henry Hazlitt said: "We are today operating under a price control law that is badly drawn and full of in consistencies—Supply and demand come into balance only at a price. That price is the one established in a free market. To hold any commodity below its free-market price is almost necessary to make the supply of it smaller than the demand------

"The way to decontrol is to decontrol. We must begin something and somewhere. If the Price Decontrol Board allows meats, milk and grains to go back under controls----it will be taking a backward step."

Since that was written, the PDB has taken that "backward step" so far as meat is concerned. It has reinstated subsidies—that economically vicious practice whereby all the taxpayers pay part of the cost of what you, as an individual, buy. It was obvious during the debate over extension of the OPA that Congress clearly intended that all commodities be decontrolled as rapidly as possible. It is equally obvious now that that intent is not being carried out. High OPA officials are attempting to exercise full war powers that no longer exist.

Prices must eventually find their own level in a free market. The normal processes of competition are, in the long run, the protector of the consumer. No manufacturer has a monoply of anything—others are trying to cut the price and increase their own sales. And in the vital retail field, competition has given us extraordinary high levels of efficiency and economy.

The present OPA law says categorically that "the general control of prices and the use of subsidy powers shall ----be terminated as rapidly as possible." It is the duty of the decontrol board to carry out that plain mandate.

Nearly 60,000 Foreign Workers Helping With U. S. Harvest

Nearly 60,000 foreign workers are in this country helping with the harvest of this year's erops, the Labor Branch of the U. S. Department of Agriculture reports.

Mexican nationals make up the largest groups of foreign workers. They total nearly 40,000. Jamaicans come next, numbering 12,000 Bahamians total 5,000; Barbadians, 3,000. Newfoundlanders, 600, and British Hondurans, 150.

The West Indians are employed mainly in New York, New Jersey, Illinois, Ohio, North Carolina, and Florida.

The Mexicans are working principally in the Middlewest, and Western regions.

Wages And Costs

"American labor has a natural interest in the relationship of wages and costs," says the New York Time editorially. "It has a right to set its sights on a steadily higher standard of living, and it will be a bad day for the country if it ever loses sight of that objective. But the shortest and straightest road to this goal does not lie thru sharp wage increases in unaccompanied by an increase of output, for this merely brings higher prices to consumers, and wage earners are themselves consumers. The right method is increased production, through higher skill, better work and the aid of modern industrial science."

The Times' editorial was occasioned by a report from Detroit that the CIO and the United Automobile Workers "have abandoned any thought of new wage increases in favor of an all-out effort to preserve the present purchasing power of the dollar——The UAW has decided, in concert with the CIO, that to make a fresh wage demand at this time might set an inflationary spiral in motion."

This is the very heart of the labor-wage controversy. Ever-increasing wages without a relative increase in productivity ean benefit no one in the long run. Every general rise in prices further reduces labor's "take nome" pay. It is good to know that some important labor groups are apparently recognizing this. It is time all labor understood it as well.

"Porgy" Likes Jamboree Queens: A. B. Hill, cripple Log Cabin jeweler, poses in his goat cart with the jamboree queens. Left to right, the queens are: Miss Louise Ross, Mrs. Rosalyn H. Carter, and Miss Jurdie Mae Algood.

Farmers' Cooperative Show Business Increase

Business volume and membership of farmers' cooperative associations showed a substantial increase in the 1944-45 marketing season over the previous season according to compilation of the Farm Credit Administration of the U. S. Department of Agriculture.

Estimated white and colored membership in the agricultural cooperatives operating in the year ending June 30, 1946, was 4,505,000 an increase of 230,000. Business handled by the cooperatives increased from $5,160,000,000 to $5,645.000.000, an increase of $485 million.

Dairy, grain, and fruit and vegetable cooperatives accounted for 60 per cent of the total volume of business. About 14 percent of the busines handled by agricultural cooperatives was in the purchasing field.

Negro farmers have developed outstanding cooperatives in North Carolina, Florida, Arkansas, and Texas.

Electricity For Every Farm

In an editoral on the private electric industry's projected $300,000 rural electrification campaign, the New York Times observes: "Electricity for every farm in the nation is a logical goal. It means more business for manufaeturers and a higher level of employment. It also means a higher standard of living for farmers plus more efficiency in many farm operations. As electricity supersedes human muscles for power, it will make farming more satisfying to able and ambitious young people. From every angle, electricity on all the farms means a better nation."

The utility industry's enormous project was announced after leaders of the industry met with representatives of the American Farm Bureau Federation. The necessary money has been budgeted and construction will be pushed as rapidly as possible. The goal is to electrify the 3,000,000 American farms which do not have commerical power at present.

It is significant that the money to be spent is all private money, earned by self-supporting, state and Federally regulated, heavily taxed businesses. The industry has said that it will go ahead regardless of what the tax-subsidized Rural Electrification Administration does. And farmers will get the best possible electric service at the lowest possible cost.

This is traditional American progress—progress that comes out of private enterprise. It isn't dependent on the whims of politicians or starry-eyed social planners.

Nine-Pound Jersey Calf Born On Colorado Ranch

La Junta, Colo., Sept. 16—(AP)—Birth to a Jersey cow of a perfectly formed calf weighing about nine pounds—less than many human babies—was reported today by Phil K. Hudspeth, La Junta veterinarian.

He said the animal, born on the Claude Fulmer ranch near here, was only 17 inches high and four inches wide, but was fully developed and had a good chance of surviving. Jersey calves usually weigh around 50 to 60 pounds.

Deficits And Inflation

Cussing the OPA has been a national pastime. Even though it has been modified it receives few kind words. All of which is natural in a country that dislikes dictation of any kind. The only hitch is the inconsistency in the reasoning of many OPA's violent critics. They forget that the thing that made the OPA in the first place was uncontrolled government deficits. Deficits year after year have cheapened our money. OPA was hired to soften the inevitable blow. Its original purpose was to prevent economie disruption of the war effort. After the war it indulged in every cheap, punitive trick imaginable to hide the effects of increased cost of production and rising prices But it could no more stem the tide than it could freeze the rising of the sun each morning—because the public debt continues to increase to this day.

Many of the people who belabor the OPA most violently are the very ones who applaud when the Federal government builds a hundred-million-dollar electric power dam or indulges in some other useless project which puts a few more names on the public payroll. Mem bers of Congress actually brag, while the country staggers under unprecedented debt, of the public money that they have secured for their districts. They brag of their part in undermining the solvency of the Federal government, and are re-elected by the OPA haters for their achievements!

As long as the public debt continues to rise there will be terrific pressure for Federal dictatorial control over th free market. The longer the people submit to such control, the harder it will be to preserve liberty and the American type of representative government. Finally if the deficits continue. this country will have what has come to be known as European inflation. in spite of the fact that we think we are too big and too smart to permit such foolishness.

STEER GAINS BOOSTED

Steers running on pasture that had been fertilized with rock phosphate and limestone gained three times as much as steers running on untreated pasture. in test at the Western Kentucky Experiment Substation at Princeton.

Juvenile Delinquency Conference

The U. S. Department of Agriculture will take part in the National Conference on Juvenile Deliquency to be held in Washington October 21-23.

The Bureau of Agriculture. Farm Security Administration, Extension Service, and the Bureau of Human Nutrition and Home Economics are preparing 10 reports on "Rural Aspects of the Prevention and Control of Juvenile Delinquency" as a basis for discussion at the conference.

The reports will contain facts on the situation and the need, as outline of jobs to be done, and suggestions for community action. They will be directed specifically to government and civic organitions, service clubs, commerce groups, social agencies, and farm organizations. Although statistics on delinquency are not complete, it is pointed out that there is growing evidence that problems may be at least as great and widespread in rural areas as in cities.

Sugar Supply Averages 72.3 Pounds Per Person

The U. S. Department of Agriculture has announced that sugar allocation for civilian distribution for October, November, and December will be 1,187,000 short tons —72.3 pounds per person.

To alleviate the difficulties being encountered by consumers east of the Mississippi in redeeming their ration coupons, efforts are being made to move beet and cane sugar from the West to the East. Substantial quantities are being moved despite the difficult transportation situation. No general improvement in the supply is possible until the 1947 Carribbean crops begin to move in volume—approximately six months from now.

Agriculture Puts Penicillin Forward

Praise of penicillin, the wonder drug of this war, is not needed with those servicemen injured in combat. They have seen its value. What isn't known to many of them and to others is agriculture's contribution in making this drug available to mankind.

Scientists of the U. S. Department of Agriculture's regional laboratory at Peoria, Ill., tested many molds from all parts of the world as a source of penicillin and found one growing on a cantaloup right under their noses which proved to be the grand champion. From January to June 1943 the total production of penicillin was only about 400 million units, enough to treat about 400 serious cases. By the last five months of 1945 the production had been stepped up to more than 677 billion units per month.

The wholesale price has dropped from $20 to around 60 cents per 100,000 units and the storage life of the drug has increased from three to eighteen months, reports C. F. Speh, assistant chief of the U. S. D. A. Bureau of Agricultural and Industrial Chemistry, in reporting the results of the work of the laboratory.

The cost of the Department of Agriculture's research that increased the yield of penicillin and led to commercial production of the drug was approximately $100,000. The value of the penicillin produced in 1945 alone, is estimated at $100,000,000, he said. No value can be placed on the human lives saved with this drug.

Watch It Flow

You can see the milk flow from the cow to the pail with the new plastic transparent milk tubes, now available to dairymen.

These new tubes aid in faster milking since the dairy farmer knows when the cow is milked and can switch to another cow. Also the new tubes are easier to elean since they are smooth inside with no space for milk to lodge.

Anxious Egypt Watches Nile As Record Inundation Expected

CAIRO—(AP)—Beginning earlier than usual, this year's abnormally high Nile flood has been headline news here for weeks as Egypt made preparations for what was expected to be the most dangerous inundation recorded in 95 years.

So menacing were the river's swollen tributaries that evacuation of some of Egypt's principal towns was considered. Credits of 420,000 Egyptian pounds (about $1,680,000) were opened and the ministers of public works, interior and national defense pooled their forces and all available labor was mobilized to avert the threat to lives and crops.

Prime Minister Sidky Pasha put the matter very bluntly to reporters: "We are threatened with dangers we cannot estimate." This sense of tense anxiety was reflected in newspapers and in prayers offered in Egyptian mosques and churches.

The abnormally swollen river is going down now as the flood crest sweeps down its 3,500-mile course to the Mediterranean and Abdel Kawi Ahmed Pasha, minister of public works, said he hoped all danger would be past by the end of September. Many farm cottages were washed away in upper Egypt, some village populations were marooned and 182,000 tons of maize were destroyed, but no loss of life was reported and Ahmed Pasha said most of the crops had been saved from the surging waters.

The Nile floods, a months-long inundation each year, are an age-old story to Egypt. Her fortunes and the progress of the steam are wedded eternally. A small rise and a poor summer flood mean that crops suffer and yields are poor, an excessive rise may mean destruction of much of the farmer's work.

King Farouk rules over 385,000 square miles, an area nearly twice that of France, but 97 per cent of his country is barren sand and rock. Nearly all the cultivated land of practically rainless Egypt stretches in a narrow ribbon along the Nile banks. The width of this fertile belt, never great, varies from a mile or so in the south to as much as 12 miles in the north. Below Cairo to the sea stretches the broad triangular area which the Greeks called Delta, with some of the world's most fertile soil.

Clustered close to the river, the 17,000,000 Egyptians form one of the most compact nations in the world. The populated area has an average density of 1,045 persons per square mile, almost twice that of Belgium, the most thickly populated country in Europe.

Since agriculture is the chief occupation, employing 80 per cent of all occupied males, and the products of the land are the chief source of wealth, it is little wonder that the rise and fall of the Nile is watched with great interest and concern. Egpyt owes her existence, her personality and her Unity to the river. The two gods ancient Egypt worshipped above all others were Ra, the sun god, and Osiris, the Nile god, the imperishable life-giver.

Egypt's two national feast days, Sam El Nassim(literary "Sniff the Breeze" Day) a spring festival corresponding to Europe's May Day and the Feast of the Nile Flood in late August bear eloquent witness to the Egyptians' continued preoccupation with sun and river.

Abyssinian rains are responsible for the regular June to October inundation of the Nile valley. The discharge of water from Lakes Victoria, Albert Edward and Albert near the equatorial sources of the Nile is fairly regular. In Abyssinia, however, the heavy rains between April and September send enormous quantities of water thru the important Blue Nile and Atbara tributaries, rivers which for the most of the year have only dry beds and disconnected pools in their deeper portions. It is this extra summer rainfall which cause the great Nile floods. As the floods subside, a layer of rich fertilizing mud is left behind.

Engineers have calculated that this annual mud deposit raises the land level, four inches a century and that the general level of the valley today is 20 to 30 feet higher than when the Pyramids were built.

"The dust is gold," say the peasants, recognizing that Egypt's chief wealth lies in her rich soil.

As one Egyptian sociologist has put it: "This great river (the Nile) may rightly be called the liquid history of Egypt. It is today as it was in the dawn of history, the very life of the country. Its rise and fall shape the destiny of the population and the reading of its gauges in the spring every year, diagnoses and predicts the economic situation for the next 12 months. The whole social structure of the country is shaken to its foundation if a low flood takes place. Even crime rises and falls inversely as the Nile."

Make The Farms Hum

By Grace Armstrong Allen

Advising about supers at this time of year brings one into what the late President Roosevelt used to call an "iffy" discussion. "If supers are needed, give them," I said last time. Yes, if!

If you had previously removed all supers when you took off your main crop, you did need one for your fall flow and winter stores. If you already had several supers over the brood chamber, you probably didn't. Some of us around here had several on—some full-depth, some shallow, but we got a little excited over incoming nectar and the bees we saw on boneset and even goldenrod. Wondering if that rare event, a fall surplus, was about to occur, we put on extra supers. It looks now as though they will not be needed.

But notice this, and admire the sagacity of the bees. Queens are still laying, of course. But as the cells in the upper parts of the brood nest are vacated by the emerging young, the workers reclaim them for storage. They are carefully cleaned and prepared for incoming nectar. Thus the queen's laying is restricted. "They're crowding her down," the beekeeper says. And as the brood nest gets smaller, the stores are drawn more closely around.

If those extra upper supers are not needed, they are likely to remain empty, unless perhaps for an annoying dribble of stickiness. Maybe some bees have a sense of humor!

Bees get unusually busy in the spring (No, I haven't mixed my dates), and they need lots of food. Spring management is pointed to getting a surplus from the approaching main flow. And good spring management starts in the fall. September bees are usually fairly active. Not like in May, of course; yet through September and decreasingly through October, Tennessee bees in normal seasons are bringing in some nectar. By early October, you will want to notice how well stores are being piled up, and begin to make plans.

When modern hives were first used, it was common practice to winter in just one full depth chamber. Decades ago, we graduated from that folly. There must be two stories, at least, and the upper one, often referred to as the food chamber, should be filled with sealed honey.

If this upper story, this food chamber, is shallow, it will provide the bees with about 30 pounds of stores. We once thought that generous for wintering. Now we know it as a niggardly minimum, which will almost certainly run short in the spring. If the upper story is full depth in size, and full of sealed honey, it means 50 pounds. In either case, there may be—and should be—several combs solid with honey in the lower story (the brood chamber). This may save the day—and the bees—in the hive with the shallow food chamber, and will give added wealth to the other.

The point to remember is that the bees need 50 pounds of honey or more, to go through winter and on to the main flow. I recently read about a beeman in Wisconsin who prefers 80 pounds. (They are supposed to need less in the North than in the South.)

You see, there is nothing less certain than spring weather. And there is nothing more certain than that plenty of stores in the spring is the one dependable thing to keep the queen laying heavily. And it is egg-laying that builds up strong colonies ready to roll in the nectar.

So let's start our spring management this fall, so that next year Tennessee farms will truly hum!

Peach Growers Urged To Make Control Plans

Growers of peaches and other stone fruits should plan now to get their chemicals on hand for peachtree borer control next month, according to J. C. McDaniel, state horticulturist.

Three materials are now used Paradichlorobenzene (PDB) in the familiar white crystals, or in oil solution; Ethylene Dichloride Emulsion (EDE); and Propylene Dichloride Emulsion. Ethylene Dichloride emulsion, a liquid treatment, was introduced several years ago and has been used extensively in commercial orchards. Its principal advantages over PDB are that it is more effective during later fall when the soil cools off, it is easier to apply, requiring little oil preparation and less mounding; and it may be used at diluted strength even around young nursery trees.

Proplene dichloride emulsion. commercially available for the first time this year, has been tested over a five-year period by the Federal Bureau of Entomology and Plant Quarantine, who found that it has a number of distinct advantages over both ethylene dichloride emulsion and PDB for the control of the peachtree borer.

Dr. Oliver I. Snapp of the Bureau, reports: "On various dry and wet soils it has given excellent control of this insect without tree injury when used at one-half the recommended strength of ethylene dichloride and as these materials cost approximately the same per pound, the propylene dichloride treatment is the cheaper. Propylene dichloride, is effective at low soil temperatures and can therefore be used late in the fall and early in the spring, when it is too cold to use (PDB) effectively. It is safer around young trees, easier to apply, and more effective. Furthermore, the propylene dichloride treatment requires a minimum of preparation of the soil before application and no attention subsequent to mounting after treatment."

Regardless of the kind of material used, the best time to kill peachtree borers in Tennessee orchards is during the first part of October. At that time (October 1-10) the eggs of the insect which were laid during late summer will have hatched.

Million Veterans Working on Farms

More than a million white and colored veterans of World War II had returned to farm work by July 1, the Bureau of Agricultural Economics of the U. S. Department of Agriculture announced in a preliminary report released recently. The report shows that of the 1,045,000 veterans employed on farms, 713,000 were operators or members of farms operators' families, and 332,000 were employed as hired workers. The veterans made up three-fourths the number of farm workers who enlisted or were inducted up to July 1, 1945.

While in the Northeast and Pacific Coast regions the number of farm workers who were veterans was larger than the number of enlistments and inductions, in other sections, they accounted for only 70 to 80 percent of the number of farm workers who left to enter the armed forces.

In the South, less than 20 percent of the returning veterans were employed as hired hands. In the Northeast and West, over half the veterans employed on farms were working as hired hands. Of the 534,000 white and colored veterans who have returned to farms in the South, only 97,000 are hired workers.

Kitchen Planning Is Urgent Need, Survey Indicates

Reduction of traffic in the kitchen is one problem confronting Tennessee homemakers, according to a survey recently conducted by Extension, home management specialists of the U-T College of Agriculture. This applies, it is pointed out whether a new home is contemplated or whether changes are needed in the present kitchen.

Almost 2,000 farm women returned questionnaires with good distribution throughout Tennessee. Fifty-eight per cent of those replying have kitchens with three or four doors. More than half the kitchens checked are less than 150 square feet in size; and about one-third are from 150 to 200 square feet.

A kitchen with four doors, unless carefully planned, means a lot of traffic through the meal preparation center the specialists point ed out. This is enhanced by a number of activities carried on in the kitchen, as indicated by the replies Sixty-eight per cent of the families eat more of their meals in the kitchen, and 75 per cent use the kitchen as a passageway, thus making difficult an efficient arrangement of the three work centers; preparation, cooking and serving; and clearing away.

Complicating the problem are some 20 to 30 activities carried on in the kitchen, as listed by the homemakers. More than half the families do the laundry in the kitchen during winter, and 63 per cent of the homemakers iron in the kitchen.

It is evident, specialists said, that the farm kitchen requires planning different from the town family kitchen for efficient operation.

Properly Equipped Farm Has Ample Equipment For Home And Field Work

By Kenneth B. McPherson

The fact that the farm home activities are so close to the business of farming is one reason why many houses are not as well equipped as the farm.

The attitude is present in many cases, that the productive side of the farm must be considered first. Barns must be built and equipped before houses. No one will deny the importance of a well stocked, well equipped farm for high income. On the other hand, the home must not be neglected because it is man's most important job on earth, to provide a good home, as well equipped as circumstances will permit.

It should be remembered that farming is a business in which the women are as keenly interested as the men. The farm that is properly equipped is one that has ample equipment for the home as well as for field work. To appreciate the need of adequate home equipment we must put adequate money value on the time of the home-maker as well as a proper regard for the health and happiness of her and the family. Equipment is bought for the farm because it is considered an investment. It saves time and labor and makes the job easier Equipment for the home should be considered as an investment also. It saves time and labor and makes the housework easier. It also pays dividends in better health, more happiness, higher morale, greater efficiency and greater production.

The job of home-making has always been generally conceded to be a never-ending task. Much of the work such as house-cleaning and washing clothes, does not contribute to the income but adds much to the comfort and happiness of the farm family. The planning and preparation of three meals a day gives ample insurance for a steady job. The food is quickly consumed and all that is left to show for the effort is a few scraps, some dirty dishes, but a satisfied family. That is not all. The task is not complete until the dishes are washed In addition to these tasks of caring for the family, the clothes and the house, and the preparation of food, the housewife is responsible for spending a large part of the family income.

The final success of any business is a dependent on the economies practiced in spending the income as on production. In times of financial depression on the farm the farm business is often held together as a result of the efforts to save on the part of the women. In fact many of the necessities of life are produced or made by them in the home. Thus, at certain seasons of the year when the annual canning is done, the farm home literally becomes a food factory. Also, a great many farm women throughout the country do the laundry work and make a substantial share of the clothes, this being a part of the routine work. In addition, many farm women help with the milking and keep dairy utensils clean, care for the garden and poultry, and spend some time even in the field.

Farm home mechanization and electrification has not advanced in Middle Tennessee to the extent that farm mechanizaion and electrification has. There are still too many homes that are not electrified even though they have electricity.

Complete home electrification will shorten the hours of labor for the homemaker. It will require of her less hard manual labor; it will add more beauty and comfort for the enjoyment of the entire family and will be a safeguard to health.

Many of us may some day regret that we did not live while we were alive.

Over 6,000,000 Youngsters Received School Lunches In '45

School lunches were served 6,655,458 white and colored youngsters in 43,480 schools last year, the U. S. Department of Agriculture reports.

The Federal Government contributed $47,844,000 toward the lunches and it is estimated that local communities contributed the equivalent of $75,000,000. Total expenditures amounted to about $18 per pupil for the year.

Under the new School Lunch Act, the States are required at the outset to share 50-50 in the program. Service and equipment in lieu of cash may represent the State's share. In 1945 the average local contributions amounted to $1.50 for every dollar contributed by the Federal Government.

The five states that led in the enrollment of pupils in the community school lunch program last year were: New York, 537,639 pupils; South Carolina, 387,593 pupils Texas. 375,200; Georgia, 342,379; and Illinois, 336,000 pupils.

Thirty-eight States and Hawaii up to now have signed agreements to take advantage of the new School Lunch Act.

The first school lunch program on record was started in Munich, Germany, in 1790, one year after George Washington became president of this young Republic. In France, the school lunch movement started in 1849, and in England, in 1902.

As early as 1853, school lunches were served in New York, but the federal school lunch program was begun in 1935. In 1894, Philadelphia began a program of feeding pupils in elementary schools. In the South, Mrs. Dora Gordon, a colored school teacher of Jefferson County, Georgia, was first to launch such a program. She began serving her pupils free noonday lunches in 1925.

34 Colored Farmers Paid $18,000 For Crop Losses

The Federal Crop Insurance Corporation paid 34 colored farmers of Arkansas $18,578,77 last year for crop losses, according to James P. Davis, field officer of the Field Service Branch.

The Arkansas farmers resided in three counties: Phillips, Lee and Monroe. Payments for crop losses due to unavoidable hazards in Phillips totaled $5,495.13; in Lee County, $5,102.58; and in Monroe, $7,981.06. The 1945 crop insurance program covered 113,000 cotton farms. Indemnities totaled approximately 40 million pounds of cotton or about 10 million dollars.

Good Pastures Essential In Raising Sheep

One of the most important jobs a sheep producer can do now is to seed an acreage of small grain sufficient to provide grazing for his flock during the late fall and early spring. Paul P. Hite, extension sheep specialist, said today.

The most successful sheep producers are those who provide winter pasture, he continued. Pastures not only supply feed at a low cost, but sheep that have access to green pastures are not as susceptible to diseases as those kept in close quarters and fed only dry feed.

Hite said ewes should be kept gaining until lambing time and this could be more easily accomplished through good green pastures (and with less cost) than any other way. One acre of good pasture is sufficient to care for five or six ewes, the specialist said. He cautioned farmers to keep a close watch and if the ewes were not gaining to supplement the pasture with dry feed.

All sheep that are to be kept through the winter should be vaccinated for hemorrhagic septicemia and treated again for stomach worms this fall. Sheep given this treatment will go through the winter in better condition, Hite said The total cost for both treatments will be less than 15 cents per head and might result in the saving of one or more valuable ewes, he declared.

A common mistake made by some sheep breeders is the making of brick salt the only source of salt for the flock. Thee breeders are correct in that salt should be kept before the sheep at all times, but should not be brick salt, Hite stated. Brick salt is not only so hard that it is impossible for the animal to get a sufficient amount, but sheep often brake or wear off their teeth in the attempt. Loose salt should be kept before them at all times.

Most producers have made considerable financial gains this year on both their wool and lamb crops, a point that should stimulate other farmers in the state to grow sheep. Hite pointed out that when a flock is well cared for the wool will pay all expenses and the lamb crop represents the profit.

Sweet Potato Price Supports Are Raised

Support prices on the 1946 crop of sweet potatoes are being raised because of an increase in the parity price for sweet potatoes, Carl Fry, state director of production and marketing administration, said today.

This action is designed to support prices to growers at not less than 90 per cent of parity. Government loans will continue to be loan settlement rates and prices made at $1.50 per 100 pounds, but at which purchases will be made have all been increased five cents a bushel over those announced on March 28.

Fire Prevention Aim: To Guard Life, Property

Fire Prevention Week, set October 6-12 by proclamation of both President Truman and Governor McCord, has but one aim—the reduction of life and property loss, G. B. Shivery, Extension forester, U_T College of Agriculture, has announced.

The cost of preventable fire includes approximately one hundred million dollars and 3,500 lives on farms. The total fire bill for the country is expected to pass six hundred millions dollars, if the present rate continues.

Loss of homes is keenly felt now, in view of the most acute housing shortage in the nation' history. Estimates place the shortage at 3,000,000 houses. Forest and woods fires contribute to this shortage, since burned timber builds no homes, and little trees killed now reduce tomorrow's timber supply.

Fire losses can be traced in almost every instance to existing fire hazards which go uncorrected, Shivery said. Correcting a fire hazard might mean merely replacing a rusted stove or furnace pipe. Or. it might be cleaning out papers trash or other combustible material.

In school, and even more effectively at home, members of the family can become acquainted with common fire hazards and effective means of preventing loss of life and property. And it certainly should not be necessary, Shivery said, to burn a house or destroy a life to teach children how to use matches.

FHA To Replace FSA

The Farmers' Home Administration has been established by the FHA Act to absorb the Farm Security Administration and the Emergency Crop and Feed Loan Division of the Farm Credit Administration. Consolidation of the two units is to be completed by November 12, says Secretary of Agriculture Clinton P. Anderson.

The new agency, FHA, will provide three types of loan assistance for farmer (1) Production and subsistence loans for operating expenses—seeds, feed, fertilizer, equipment, and stock. Such loans carry a five percent interest and are to be repaid over a one to five year period.

(2) Real estate loans which may be made for the purpose of buying. enlarging or improving a farm. Borrowers in this category will have 40 years to repay the loan at 3 1-2 percent interest.

(3) Insurance of loans which farmers may secure from private institutions will be provided by the new agency. FHA will insure up to 90 percent of the amount of a loan. This will be an entirely new feature in the lending program of the U. S. Department of Agriculture.

While FHA is just beginning to formulate its organization, it is understood from the authority given by the FHA Act that the new agency will operae very similarly to the way FSA was operated. It's head is Dillard B. Lasseter, FSA administrator, who was appointed two weeks ago by President Truman.

Under FSA, over 100,000 colored farmers received assistance. Of these about 6,000 were started on the road to farm ownership thru farm ownership loans.

Fertilizing Now Insures Good Crop Of Strawberries

By Dr. Floyd Bralliar
Garden Editor
The Nashville Tennessean

Probably the most popular of all fresh fruits is the strawberry. Coming as early in the spring as it does, before other fruits are ready, its combination of beautiful color with the delectable aroma and flavor combined to give it its great popularity. Besides all this it is one of the easiest of fruits to grow and if given the right sort of soil and culture, it can be made to produce as much as 10,000 guarts of fruits per acre.

Strawberries have been almost prohibitive in price for the last two or three years and even at the extravagantly high prices they have been selling, for it has been almost impossible to secure them even in the height of the season in many localities.

Planting Tips

Because strawberries should be planted early in the spring, many will be wondering why we are writing about growing our own table supplies at this season of the year. For quality as well as quantity, and fine appearance, strawberries should be planted on very rich soil, that contains an abundance of both fertility and humus. The ideal strawberry soil should be thoroughly fertile to a depth of a foot and should contain enough decaying vegetable material to make it reasonably loose. Properly fertilized and properly cared for a patch as small as 20 feet square will produce the strawberries a family will use fresh and a reasonable amount for preserving.

Every family that has even a little room for them should plant strawberries. This is the season to prepare the soil. The best way to do this is to fertilize very heavily with stable manure, bean or pea hulls and vines and anything else that will decay quickly, and turn under to a depth of eight or ten inches. Then if it is possible to secure it, get a light coat of stable manure over the surface and sow crimson clover and field rye as a cover crop. The sooner this is done, the better results can be expected, for we wish to get as heavy a crop of growth this fall as possible.

Turn Over in March

About the middle of next March turn this cover crop under at least six inches deep, rake the surface level, apply a good complete commercial fertilizer at the rate of four pounds per square rod. Scatter this evenly over the surface and rake it in well with a garden rake. In two weeks set this out with strawberry plants. Even if this soil was comparatively fertile, this much fertilizer applied now would not prove to be too much. But even if the soil was comparatively poor to start with one may expect an outstanding crop of strawberries if it is handled in this way. But do not make the mistake of setting out strawberries in the fall in most of our territory.

What we have said about preparing the soil for strawberries is not only vital, if we secure a good crop of this fruit, but is also highly important for most of the more important gardening vegetables. The sooner we learn to properly fertilize our gardens and the sooner we realize that every bit of vegetation is valuable as a soil conditioner and allowed to decay, the sooner we will become first class gardeners, the wonder of our neighbors and friends.

Lawn Clippings

Recently we visited at a friend's home and found him mowing a rather good sized lawn. He was carefully collecting all of the lawn clippings and carrying them to his garden where he spread them about two inches deep over the surface of the soil between the plants. On inquiry he told me that he was going to spade this all under when his crops matured and by the following spring it would be decayed well enough to not only provide fertility to the next year's crop but would be an important element in holding the required moisture in the soil. He said he had done this for years.

I could then understand why his garden was of so superior quality and so few insect pests. Healthy well nourished plants are not relished by insects—neither are they easily subject to diseases. What we have written applies not only to strawberries but to all varities of plants, both vegetables and flowers Of course there are many varieties of spring flowering plants and bulbs that should be planted this fall. Of course this makes it impossible to do all the fertilizing we have suggested at this time. But it is highly important that he do this as rapidly as we can.

Beauties Inspect Worn-Out Soil: A. S. Bacon, assistant State supervisor of Negro Extension work, shows three jamboree queens a clod of worn out soil. Left to right the beauties are: Miss Louise Ross, an instructor in mathematics at Paine college; Mrs. Rosalyn H. Carter, junior high school teacher at Siloam, Georgia; and Miss Jurdie Mae Algood, a student at Georgia State College. Mr. Bacon directed the jamboree.

Tomato Crop Damaged By Weather

Tomatoes suffered more than their usual share of troubles this year, a blanket reason being the weather, according to John S. Gardner, Kentucky College of Agriculture. At the season's start there was too much rain and the soil stayed cold and clammy, but tomatoes are a warm crop. The excessive moisture dissolved the nitrates in the manure or the fertilizer, and when growing weather came vine growth went wild.

Fruit that set partook of the sappy nature of the plants and rotted sometimes before any sign of ripening. During the wet weather, pollination was faulty and misshaped fruits resulted with blackened seed cells.

To add to the tomatoes' troubles came the several leaf diseases collectively called "blight," that knocked off the foliage to cause the fruit to sun-burn.

One takes the weather as it comes. but it was observed that when an abundance of phospho rous was used. fewer faulty fruits were found and ripening was more nearly normal. As the season and the soil became more dry, normal fruiting following where the plants were kept healthy by spraying with bordeaux or with copper oxide. In this connection, the new spray. Fermate, gave enough promise to warrant further work being done with it.

Summing up, it appears that to some extent the weather can be "outshrewded" by using super phosphate with the stable manure, or a complete fertilizer whose middle analysis figure (phospho rus) is high. And while the tomatoes are waiting for their kind of weather. they should be kept protected to keep the blight away. Also, there is evidence that the tough-skinned types of Marglobe and Rutgers survive fruit faults better than the others.

Pullets Produce Most Eggs When Given Full Feed

Free choice, or the cafeteria method of feeding pullets is a doubly profitable practice in poultry management, specialists of the Agricultural Extension Service, University of Tennessee, announced today. Not only does this save labor, but it pays off in greater egg production, as shown by experiments.

In one experiment, it was found that reducing full feed by one-eighth resulted in a 32 per cent decrease in egg production. Reducing the total feed consumption by 25 per cent resulted in a 52 per cent decrease in egg production.

Results of this experiment show that pullets coming into production need very special care, the specialists pointed out. However, feeding is not the only consideration for best production. Along with feeding may be problems of space per pullet, ventilation, water supply and "daylight adding time."

Heavy breed chickens require three and one-half to four square feet of floor space per bird in a 20 by 20 house. Leghorns require slightly less space.

A continuous water supply is important. A hen's body is about 66 per cent water; and eggs contain about the same water percentage. Hens, therefore, cannot lay without water.

A hen needs about 13 hours of light to produce at top rate. Electric lights, or lanterns, should be used to provide a 12-hour day for layers.

2,347 Calves To Show At Louisville Yards

Members of 4_H clubs in 46 counties have entered 3,347 calves in the 25th annual Kentucky Fat Cattle show and Sale to be held at the Bourbon Stock Yards in Louisville, November 6_8.

Cash prizes totaling $3,728.50 plus $200 given by national breed associations, will be divided among the 4_H Club exhibitors. Owners of the champion Angus, Hereford and Shorthorn calves will receive trips to the national 4_H Club Congress in Chicago.

According to breeding, the 4_H Club calves will include 1,284 Angus, 892 Herefords, 75 Shorthorns and 96 mixed.

Record Sized Apple Grown By Dyer Man

Dyer, Tenn., Sept. 23—What is believed to be a world's record on size apples was set here by M. D. Barron, superintendent of Dyer City Schools.

He recently brought a bushel of Stayman apples to a local grocery—and the bushel had only 51 apples. The average apples run 90 to a bushel.

At the ceiling price of 12 1-2 cents per pound, one of Barron's apples would cost 15 cents. However, Barron is not selling them at ceiling price. An "old_timer" states that the largest apples ever seen around Dyer before counted 60 odd per bushel.

104 Million Pound Leaf Output Likely In State

Washington, Sept. 30—(AP)—The Agriculture Department today put an estimate of 401,350,000 pounds on the 1946 Kentucky tobacco crop.

Total production, said the agency, likely will reach a record breaking 2,221,000,000 pounds.

The latest estimate is three per cent higher than a forecast made last month. It applies to all types of tobacco with the exception of perique, expected to show a slight decline.

The previous record crop was 1,998,000 pounds last year.

Estimates for other burley producing states: Ohio, 15,960,000 lbs.; Indiana, 13,125,000; Missouri, 7,920,000; Kansas, 278,000; Virginia, 20,010,000; West Virginia, 3,570,000; Tennessee, 104,400,000. Alabama, 80,000, and North Carolina, 16,875,000. The North Carolina flue cured output was figured to be 366,000,000 pounds.

WOMAN'S PAGE

Make It Steak

Most cooks will need a refresher course in the art of steak cookery, since the opportunities for practicing that skill have been rare during the meat shortage

By Mary Lyles Wilson

The housewife's favorite dream during the last yearor so has been an inch-thick steak, broiled, buttered and big as all outdoors. But, few as the opportunities have been for making the dream come true, many a practiced cook may have become a trifle rusty in the trick of putting a steak through its paces

If you are going to broil or panbroil the steak, ask for choice grade beef, either porterhouse, T-bone, club steaks, tenderloin, sirloin, pin bone sirloin or rib steaks.

For oven broiling, have the steak cut at least one inch thick. Panbroiling or griddle broiling is preferable for thinner steaks. The only preparation necessary before cooking the steak is to trim off all extra skin and fat and wipe with a clean, damp cloth. With the oven regulator turned to "broil," place the meat on the rack of the broiler two or three inches from the heat. The thicker the steak, the farther it should be placed from the heat. Broil until the top side is brown, season with salt and pepper, butter, turn and brown on the other side. Season again and serve piping hot. Steaks do not stand well and they should be served immediately after cooking.

If you are cooking the meat in a frying pan or on a griddle, a heavy one is preferred. The pan need not be sizzling hot, since the meat merely starts cooking more quickly if the pan is pre-heated. Brown the steak slowly on one side, sea son with salt, pepper and bits of butter, turn and continue cooking until steak is brown and as done as you desire. Do not add extra fat or water, and never cover the pan. Pour off melted fat as it accumulates; otherwise the meat will be fried. Season with salt, pepper and butter and serve hot on a heated platter.

The length of time it takes to cook steak depends on how done you want it and how thick it is. A one-inch steak will take approximately 15 to 20 minutes in the broiler to be served rare and 20 to 30 minutes for a medium steak. Pan broiling takes about one-half as long as oven broiling.

To dress up broiled steak, serve it planked. If you do not have a regular plank, a broiler grill will serve the same purpose. Any steak suitable for broiling may be used in this way. If a broiler grill is used, prepare in the same way as for oven broiling. If you are using a wooden plank, steak should be cooked on one side on a broiler and then transferred to the buttered plank for the rest of the cooking. Or, if you prefer, sear it on both sides before transferring it to the plank.

With a pastry bag, mashed potatoes are aften arranged in a border around steak with the other vegetables that the chosen to serve with it. With the steak in the picture, we use mushrooms, over-and baked stuffed tomatoes.

Planked Steak

Broil a tender cut of steak about one inch thick just enough to sear surface on both sides. Heat and butter plank, place steak in center of plank. With mashed potatoes in pastry bag or double paper tube, making a border on edge of plank, and brush with beaten egg. Arrange any prepared vegetables desired inside potato ring and around steak. Buttered carrots, string beans, baked stuffed tomatoes or green peppers, buttered peas, fried onion rings, stuffed onions baked, buttered asparagus, browned potatoes, or cauliflower are the ones from which a choice of three or more is usually made. Place in top of hot oven for potatoes to brown and steak to finish cooking. Garnish with parsley.

Sauteed Mushrooms

Remove stems, wash well and dry. Melt two or three tablespoons butter in heavy skillet; add mushrooms and simmer about 10 minutes. Sprinkle with salt and pepper. Serve on buttered toast or over steak.

Stewed Mushrooms

2 cups mushrooms
4 tsp. lemon
1 tbsp. butter
1 tsp. chopped parsly
Salt and pepper to taste

Wash and drain mushrooms; place in stewpan with butter and seasoning. Cook 10 minutes slowly, tossing constantly; add lemon juice and parsley. Serve on toast with steak. Serves five to six.

Scalloped Mushrooms

2 cups broiled mushrooms
2 cups bread crumbs
1 cup cream
salt and pepper

Place mushrooms and bread crumbs in alternate layers in buttered baking dish; season each layer with bits of butter, salt and pepper. Pour cream over all and bake in moderate oven 20 to 25 minutes. Serve with steak.

Smothered Onions

6 medium sized onions
4 tbsp. butter or bacon drippings

Peel and slice onions thin. Heat fat in skillet; add onions and cook over slow heat about 30 minutes, stirring often. Serve hot.

Fried Onions

Place onions in cold water; peel; cut into slices. Cover with boiling water and boil 20 minutes; drain well. Place in frying pan with a little butter or fat, salt and pepper. Fry slowly 20 minutes.

Onions may be fried without boiling.

Another way to prepare: Slice onions and dip into sweet milk; drain and dip into flour or bread crumbs; sprinkle with salt and fry in hot fat about 10 minutes. Onion rings are prepared in the same way by separating each slice into rings and dipping in crumbs or batter before frying.

To fry onions and apples; slice apples and onions, using twice the amount of tart apples as onions chop fine and fry in melted fat. Cover and cook until tender; sprinkle lightly with sugar. Serve at once.

Broiled Onions

Slice one large Spanish onion, sprinkle with salt. Saute in melted butter until brown on each side. Serve on rounds of buttered toast.

Boiled Onions

Peel off outside skin. Cook in boiling salted water until tender. Serve whole, seasoned with melted butter or cream sauce. If large, cut in half, after boiling, and serve with cream sauce.

Stuffed Onions

6 medium sized onions
1 cup minced or ground cold meat or 2-3 cup chopped pecans
1-2 cup bread crumbs
1 cup water
1 heaping tbsp. butter
salt and pepper

Remove outer skins and boil onions until tender, cutting out the center before cooking. Chop the pieces. Add a few bread crumbs, minced ham, chicken or veal, nuts or a combination. Season highly with salt and pepper. Moisten with melted butter. Fill cavities of onions, put in baking dish, pour over this a little milk or cream. Put in stove and bake until tender and brown, after sprinkling top with bread crumbs. Serves six.

Stuffed Potatoes

Boil or bake potatoes in jackets. Cut off end carefully, keeping the hull from being broken. Scoop out potato. Season with butter, pepper, salt, and a little grated onion. Fill hulls full. Run in oven to season. Serve hot. Cheese may be used grated instead of onion or both if liked.

Baked Stuffed Tomatoes

6 tomatoes
1 heaping tbsp. bread crumbs
1 tbsp. grated cheese
6 mushrooms
1 tbsp. chopped parsley
1 tbsp. butter
salt and pepper

Cut the tomatoes in halves if large enough, or scoop out center of each. Scrape out some of pulp and add to the mixture. When mixed, fill tomatoes place in buttered pan, season highly and bake in moderate oven 20 minutes.

Combinations which may be used in stuffing tomatoes include corn, bread crumbs, seasoned with minced onions, salt, pepper, chopped cabbage, topped with grated cheese; stewed squash and chopped tomatoes, topped with bread crumbs, boiled rice and chopped nuts.

ORANGE HONEY CAKE

2 cups sifted cake flour
3 1-2 teaspoons baking powder
3-4 teaspoon salt
1-2 cup shortening
1-2 cup sugar
2-3 cup honey
2 egg yolks
1-2 cup orange juice
2 egg white stiffly beaten

Sift flour once, measure add baking powder and salt, and sift together three times. Cream shortening thoroughly, add sugar gradually, and cream together until light and fluffy. Add honey. Blend. Add egg yolks and beat thoroughly. Add flour, alternately with orange juice, a small amount at a time, beating after each addition until smooth. Fold in egg whites. Bake in two greased 9-inch layer pans in moderate oven (350 degrees) 30 to 35 minutes. Frost with favorite icing.

Grease and lipstick marks can be removed by sponging the spots with either kerosene or carbon tetrachloride and washing in hot suds.

FIVE-WAY COOKIES

1 1 3 cups (15-oz. can) Eagle Brand Sweetened Condensed Milk
½ cup peanut butter

Any one of the 5 ingredients listed below:

(1) 2 cups raisins
(2) 2 cups corn flakes
(3) 2 cups bran flakes
(4) 1 cup chopped nut meats
(5) 2 cups chopped dates

Mix Eagle Brand Sweetened Condensed Milk, peanut butter, and any one of the 5 ingredients listed above. Drop by spoonfuls on greased baking sheet. Bake in moderately hot oven (375o F.) 15 minutes or until brown. Remove from pan at once. Makes about 30..

SPICE BALL

Put spices for pickles in an aluminum tea ball. You can then remove the ball easily with all its contents, and sometimes use it again for the next batch of pickles.

RASPBERRY JAM MAKES DELICIOUS CAKE SAUCE

Pick up a jar of black raspberry jam and some bananas on your next marketing expedition and try this new creamy sauce. It's delicious on angel food or sponge cake or cottage pudding.

Black Raspberry Sauce

1 tablespoon pureed banana
1 3 cup raspberry jam
¼ teaspoon grated lemon rind
⅛ teaspoon salt
1 egg white, unbeaten
1 teaspoon lemon juiee
1 tablespoon cream

Force banana through fine sieve and measure one tablespoon puree into bowl. Add jam, lemon rind, salt and egg white. Beat with rotary beater until creamy and stiff enough to stand in peaks. Fold in lemon juice and cream. Chill. Approximate yield: 1½ cups.

CINNAMON MUFFINS

If you want to pep up lazy mornings appetites, serve cinnamon muffins for breakfast. They are easy to make if a box of fully prepared hot muffin mix is used. Just add water and after putting the batter into well greased muffin tins top each muffin with a teaspoon of sugar blended with cinnamon to suit your taste. Bake in the usual way.

Never wash shucked oysters as it may mean the loss of fine flavor.

NEW SLEEVE SILHOUETTE PREDICTED FOR FALL

Among the fashion highlights of styles presented by the couturier group of New York dressmakers are the new sleeves. For several seasons the deeper armhole has set the trend for fuller sleeves but not until this season could one detect a radical change in sleeve silhouette. Granting that the straight sleeve has not been discarded, one is attracted, says Kay Daniels, fashion reporter, by the number of wide gathered sleeves, and the great variety of sleeves, included those which puff out between the elbow and shoulder and narrow down to a slim fit at the wrist. One such dresss has a contrasting inlay of medieval design banding the neck and running down the middle of the full puffed sleeve.

Full sleeves appear to be good sense, too. They act as a well balanced foil for the fitted bodices that are manipulated to slim the waist by accenting the hipline with fullness and draping.

FRESNO APPLES

½ sup seedless raisins
4 medium-size cooking apples
1 cup fine bread crumbs
¼ cup granulated sugar
1-3 cup grated American chees
½ teaspoon salt
3 tablespoons butter or margarine
1¼ cups water

Rinse raisins in hot water; drain. Wash apples, remove cores and slice apples (unpeeled) about ¼ inch thick. Cover the bottom of a casserole with apples, add a layer of bread crumbs, sugar, cheese, salt, raisins and butter. Add another layer of apples, then bread crumbs. Repeat until all are used, leaving bread crumbs dotted with butter on top. Add water and bake about 1 hour in a moderate oven (350 degrees). Cover casserole for the first half hour of baking Serves 6.

PECAN PIE

Plain pastry for one-crust pie
1 tablespoon sugar
2 tablespoons flour
3 eggs
2 cups dark corn syrup
1 easpoon vanilla
¼ teaspoon salt

Line pie pan with pastry and crimp edges. Mix sugar and flour. Beat eggs until light, and add sugar and flour mixture; beat well. Reserve enough pecans to place on top of filling. Add syrup vanilla, salt and pecans to first mixture. Pour into pastry-lined pan; arrange remaining pecans on top. Bake in moderate oven (375 degrees F) for 45 to 50 minutes, until firm.

Lima beans take their name from Lima, Peru, whence an American naval officer brought some seeds to his New York State farm to give them their first push toward popularity in the United States.

Sorrel, a hardy perennial used in soups, salads, sauces, grows freely in any garden and is increased by dividing the roots during the early part of spring.

Since eggs are laid at a temperature of about 104 degrees, they must undergo a "eooling off period." Cool them in wire baskets over night before placing them in cases or cartons.

PEACH AND DATE SALAD

For each salad arrange three peeled peach halves, clover-leaf fashion, on crisp lettuee and place three cream cheese filled dates on the plate. Top the peaches with a mayonnaise dressing.

U. S. milk production of 122,-219,000,000 pounds in 1945 reached the highest total in history.

SPICY ICED COFFEE

6 cups double-strength brewed coffee.
2 two-inch cinnamon sticks
¼ cup sugar (or syrup)
1 cup heavy cream
¼ teaspoon almond extract
2 tablespoons sugar

Pour hot coffee over cinnamon and let stand for one hour. Strain and stir in the sugar and half of the cream, Chill. Whip remaining cream, add the almond extract and the two tablespoons sugar. Pour coffee mixture over cruched ice in glasses and top with the whipped cream. Six to eight servings.

Imagine: PERFECT
lemon filling without cooking
MAGIC LEMON MERINGUE PIE

1 1-3 cups (15 oz. can)
Eagle Brand Sweetened Condensed Milk
½ cup lemon juce Grated rind of 1 lemon or ¼ teaspoon lemon extract
2 eggs, separated
2 tablespoons sugar Baked pie shell (8-inch)

Blend Eagle Brand Sweetened Condensed Milk, lemon juice, granted lemon rind or lemon extract, and egg yolks. Pour into baked pie shell. Cover with marinque made by beating egg whites until stiff but not dry and adding sugar. Bake in moderate oven (350 degrees F.)
10 minutes or until brown. Chill.

BAKED CUSTARD

2 3 cup Eagle Brand Sweetened Condensed Milk
2¼ cups hot water
3 eggs, slightly beaten
½ teaspoon salt Nutmeg

Mix Eagle Brand Sweetened Condensed Milk and hot water. Pour gradually over eggs. Add salt. Pour into greased baking dish or custard cups. Sprinkle with nutmeg. Place in pan filled with hot water to depth of custard. Bake in slow oven (325o F.) about 1 hour or until custard is set. (A knife blade inserted will come out clean when custard is done. (Serves 6)

VANILLA ICE CREAM

2-3 cup Eagle Brand Sweetened Condensed Milk
½ cup water
1½ teaspoons vanilla
1 cup whipping cream

Set refrigerator at coldest point Mix Eagle Brand Sweetened Condensed Milk, water and vanilla. Chill. Whip eream to custard-like eonsistency. Fold into ehilled mixture. Cover with waxed paper and freeze in freezing unit of refrigerator until half frozen. Stir with a spoon until smooth but not melted Replace wax paper and return to freezing unit until frozen. Serves 4 to 6.

CAN MORE TOMATOES

The tomato is the easiest of all vegetables to can. This should be an inducement to the housewife to consider putting up some this summer. Here's an interesting angle—tomatoes do not lose vitamin "C" in canning as do some other foods and, eanned tomatoes can wait long months on the pantry shelf with only the slightest loss of vitamun "C"

Pound cake is more fragrant and more delicious when a half teaspoon of mace is added to flavor the dough.

A rooster can be an expensive summer boarder since he serves no useful purpose unless the flock is kept for hatching eggs.

Foreman (to new employe): "I'm putting this rivet in the correct position. When I nod my head hit it hard with your hammer." He woke up in the hospital.

Late Leaving Jail

The subject of this article may seem absurd since it is possible for any man tho he is in jail but a few hours, to feel that he is late leaving jail. Again it may seem ridiculous to the reader to be told that a little lady to whom we shall refer as Jen, was neither negligently nor intentionally late tho she had a chance to leave jail where she was kept as a prisoner, but being so busy, she failed to answer the call. Perhaps you have already asked yourself the question, "What could any prisoner be doing in jail that would detain him when he is granted the liberty of leaving?"

Is it a long story? No not a long story, but a short story which will doubtless have a long telling effect upon the lives of many. It all began when Jen at the request of her husband, showed or rothei led one of his friends to the place where the husband earned a living by working at night. The young man being hired immediately said, "Remain a few minutes, I am sure I will get some tips, and I would like to give you something for bringing me over." An hour later Jen, a young lady in her early twenties, having placed the gift of appreciation in her purse, was making her way home. In that purse she had a small Bible which she used in Sunday school, Mission Society, and in church services. As a matter of fact, she hardly ever went anywhere without her Bible. Jen was stopped by an officer of the law who thought because of her size that she was only a little girl keeping late hours with mischief in mind. No explanation was accepted; she was carried to jail and placed in a section where rowdy, immoral girls and women were kept.

She had never heard so dreadful a sound as a clicking lock when the jailer turned the key that shut her out from the liberties of life. with a broken heart, watery eyes, tear-stained cheeks, and a troubled mind, she wished for husband, mother, pastor and friends. After crying and worrying for more than an hour, there seemed to come a beam of light into that jail house. It was not a beam visible to the natural eye, but perceptible by a spirit-guided heart. It seemed to remind her that God is a very present help in the time of trouble. Being a member of the choir, Jen decided to sing a song. She began singing the third verse of a hymn: "Let shadows come, let shadows go; Let life be bright, or dark with woe I am content for this I know, Thou thinkest Lord of me. ——(Chorus) Thou thinkest Lord of me, of me; Thou thinkest Lord of me. What shall I fear since thou art near, Thou thinkest Lord of me." With supreme confidence in the abiding presence of God she slept peacefully until morning.

At the breakfast table Jen came face to face with a group of cussing girls and women as they all sat down to a meal of oat-meal without the home seasonings or trimmings. The gang was startled as little Jen asked them to be quiet and bow their heads while she prayed God's blessings upon the oatmeal and water which sat be-

30,000 Pounds Of Tomatoes Fresh Picked Being Rushed by Rail To Markets

Washington, D. C. — Approximately 30,000 pounds of tomatoes picked fresh from the vines in California, are being rushed across the country by rail in what constitutes the most comprehensive test ever conducted to determine the best method of handling each shipments in various types of refrigerator cars. Eleven different types of refrigerator cars are involved in the tests. In none, however is ice being used. Instead the temperature inside each car is being controlled by ventilation.

The tests are being conducted by the Association of American Rail roads in conjunction with the Department of Agriculture and three refrigerator car companies—Pacific Fruit Express Company, Burlington Refrigerator Express Company, and the Fruit Growers Express Company.

The tomatoes are being shipped from Tracy and Sacramento, California, and are scheduled to arrive in Jersey City, N. J., in time for the market Monday, October 28.

Tomato growers pick their product green and seek to keep it that way or with only a touch of redness, until it reaches destination, so that the tomato can ripen on the dealers' stands. The purpose of this test is to determine the kind and degree of ventilation that will assure tomatoes arriving at destination in that condition.

At twelve different locations inside each of the eleven refrigerator cars have been placed thermometers to record the temperatures. Each of these thermometers has been conneced with instruments on the roof which electrically record any variations in temperature that may take place. Throughout the 3,000-mile trip from coast to coast, research engineers, who are traveling on the same train with the shipment, record at each stop made enroute such variations in temperature as shown by those instruments. On arrival at Jersey City, the tomatoes in each of the eleven cars will be unloaded and carefully examined in order to determine their condition.

This test is one of ten which the Association of American Railroads and the Department of Agricul-

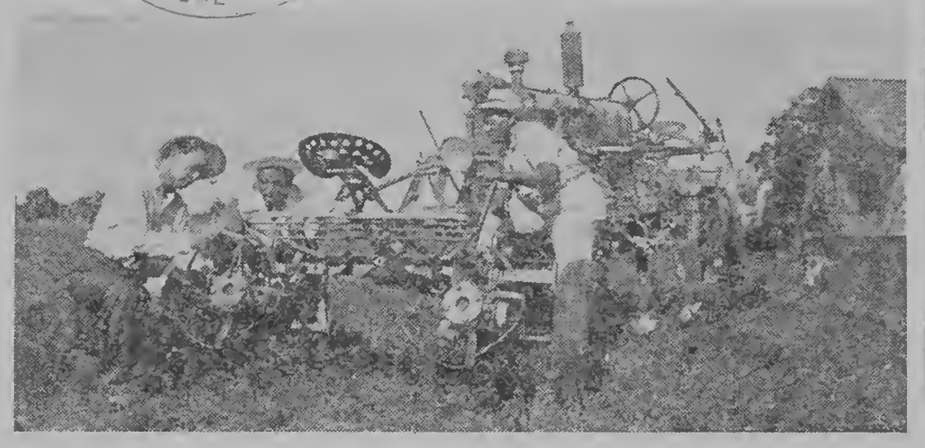
Colored Farmers Take To Mechanization



In order to reduce production costs and solve the problem of labor shortage, some colored cotton farmers are shifting to mechanization. Watt Winston, left, 300-acre cotton farmer of Moscow, Arkansas, is shown adjusting the blades on his two-row mechanical cotton chopper. He was the second farmer in Arkansas to own a chopper. Drawn by a tractor, the machine chops 30 acres per day. Note the lights on the tractor used for night plowing. Looking on are: C. P. McKendra, county agent; and H. C. Ray, district extension agent.

President Appoints Mr. Dillard B. Lasseter As Administrator Of New Farmers Home Administration

Washington, D. C.—The President appointed Mr. Dillard B. Lasseter, who has been Administrator of the Farm Security Administration since January 1946, as Administrator of the new Farmers Home Administration.

Provision was made for this new Administration in H. R. 5991, an act recently approved by the President. Agricultural credit functions of the Farm Security Administration are combined in the new agency. In addition to credit services, authorization is provided for government insurance of loans to farmers, and preference created for loans to enable veterans to acquire farms.

Mr. Lasseter, a native of Georgia, has held administrative positions in various Federal agencies for the past thirteen years. Associated with Mr. Lasseter in handling the credit services provided under the Farmers Home Administration Act, will be S. Paul Lindsey, Jr., of Illinois, present director of the Emergency Crop and Feed Loan Division of Farm Credit, and Robert W. Hudgens of South Carolina now serving as associate adminis-

Negro Agricultural Specialists at USDA Outlook Conference Held in October

Washington, D. C.—T. M. Campbell and John W. Mitchell, field agents of Extension Service, and Dr. J. R. Otis, State leader of Negro Extension work in Alabama, were in attendance at the annual agricultural Outlook Conference here in the Jefferson auditorium of the U. S. Department of Agriculture, October 7 12.

Secretary of Agriculture Clinton P. Anderson opened the conference with an address—"The First Years of Peace." Emphasizing the consumer aspects of agriculture, he said:

"Our accent in the coming years must be on distribution—on getting increasing agricultural production to the people who can consume it. We should not neglect a single possible approach—raising the nutritional level of the population, industrial uses of agricultural products, developments of foreign markets, and many others. These things, in turn, mean working constantly for full employment here at home and for a prosperous world.

"The recent Congress gave us a tremendously important tool with which to launch this drive toward full distribution when it enacted the Agricultural Research and Mar-

"Changes in Farming In War and Peace"

Washington, D. C., October 21, 1946:—Although in farm mechanization the South now lags behind the rest of the nation, a U. S. Department of Agriculture report says that southern farmers may have a million tractors in their fields by 1950. These, along with other developments of mechanized equipment, are expected to have far-reaching repercussions on farm production and the number of workers needed in agriculture.

The report—"Changes in Farming in War and Peace"—summarizes a study made by the Bureau in Agricultural Economics of changes in farming during the war and interwar years.

The estimate of the number of tractors to be on farms in the south within the next four years is based on five factors: (1) A backlog of purchasing power built up in the South during the war, (2) increased need for mechanization due to the shifting of farm workers to non farm jobs, (3) expected availability of tractors, (4) the versatility of the new small tractors which are well adapted to small farms and rolling land, and (5) the assumption that southern farmers may seek to catch up and keep pace with other farmers of the nation in substituting tractors for horses and mules.

As of 1944, the report shows that white and colored farmers of the South had only 357,900 tractors, while the farmers in other regions had 1,596,100. However, if more new machinery had been available during the war, the study indicates that the process of mechanization would have been more complete, especially in the Southern States.

Yet, even if the South increases the number of tractors on its farm between 1945 and 1950 at the same rate it increased them during 1940-45, the report estimates 517,700 tractors for the southern region. For the nation as a whole, it estimates 2,598,000 tractors on farms by 1950. And if the South accelerates its purchases of tractors to the extent of maintaining par with other regions, there would be 991,-

First 4-H Pig Show And Sale Held In East Tennessee

By Miss Bessie L. Walton, State Home Dem. Agent, Nashville, Tennessee

In an effort to make the 4-H Negro Club Members' Pig Show & Sale a uniformity over the State, the first attempt to hold one in East Tennessee, at Knoxville, was made October 5, 1946. There were twenty (20) boys and girls who enrolled in early Spring for the Pig Sale in October, but the scarcity of meat and lard prevented the number that desired from entering the Show and Sale.

The first prize in the Show went to Sherman Wilson, Blount County, second place to Elsie Wilson Blount County, and Johnnie Fortson, Knox County, won the third place. Johnnie sold his hog that weighed 225 lbs for $ .26¼ and the other two brought $ .25, because of the weights, 120 and 125 lbs respectively.

The Department of Agriculture, has appropriated a large sum of money to be given as prizes for those entering the Show and Sale. Mr. Robinson, Swine Specialist, University of Tennessee, Extension Service, Knoxville, was in charge of the Show and Sale..

The next 4-H Show and Sale will be in the Fall of 1947, when at least twenty (20) hogs will be entered by the boys and girls of the East Tennessee District.

Miss Minnie F. Harris, former Home Agent in the Knoxville District assisted Miss Bessie Walton, State Agent, in completing the plans for the first 4-H Pig Project. The object of the 4 H Club Members' Pig Project is to increase the meat supply and the 4 H Members have an Annual contribution by entering the Show and Sale and selling their pigs at a higher price than the regular market.

fore them. She was then asked by one of the rough girls, "Why are YOU in jail?" Even a bad girl realized that the jail is no place for a praying woman. The girls later began to cuss the matron and say many unkind things to and about her. "Don't Girls!" said Jen, "She is not the cause of our being here. She is working for a living just as we will when we are out of here. Remember, the jail needs a matron so let us be kind to her. She is not to be blamed for our mistakes." Some of the girls and women apologized to Jen and pledged to do differently.

A policeman came to carry Jen and delight other girls to appear before the judge. The eight young women rushed to Jen and said "Please pray for us that we may get out." In her anxiety to pray for the other eight, Jen failed to pray for herself. The policeman said to the girls, "Plead guilty and it will go easier with you." "To what shall I plead guilty?" asked the little prisoner as she explained that she didn't know what charges were registered against her. "Plead guilty to Vagrancy and you will probably go home this morning."

The eight girls were released and ran to Jen thanking her and saying "Your prayer did it." On the other hand, despite the fact that Little Jen had committed no crime worthy of imprisonment, she was sent back to jail.

Shortly after she had gone back to the place where the other women and girls were, a biblical argument arose among them. The discussion was about the feeding of the five thousand people with a few loaves of bread and a few fishes. One girl said, "I don't even believe that any such thing is in the Bible." They all turned to the little prisoner who looked more like a mascot than a jail-bird, asking her if it was in the Bible. Although she knew it was in the Bible, she didn't know exactly where to find it. As she took her purse and opened it to get the Bible, a prayer was whispered asking God to help her find the place. As she took the Bible and let it fall open in her lap, it opened to the sixth chapter of St. John. Silently she thanked God and began to read and teach the Bible to her fellow prisoners. Bible study became a daily affair as long as Jen remained in jail. An elderly woman who was mean, insulting and very evil in disposition was tamed by the use of the Bible.

A group of missionary women: all white but one came to the jail to render service. They called the white girls aside and talked to them and later had song and prayer service for the whole group. At the conclusion of their service, they asked if any of the prisoners would have anything to say. "Yes," said Jen as she stood up. She continued, "I don't have much faith in your religion because you came and began to separate the whites from the Negroes to your service. Surely Jesus would not take people off one race at a time, for he taught the Fatherhood of God and the brotherhood of man. Whatever kind of gospel, consolation, or personal council is good for the white women is good for colored women. If you are going to work for Jesus, do things as he would do them and not as to the convictions of the human beings." Loud AMENS were shouted by the colored missionary who was in the group. The missionaries tried to excuse themselves but could not find a way out. The firm stand in all things which Jen had taken caused one of the cussing girls to come to her and ask for forgiveness for using bad language in her presence. Another TOUGHY came to her later and said, "You are different, I haven't heard YOU cuss."

After having spent a few days in Jail Jen noticed that the meals were getting better. They were having fruit with their breakfast and some added things for dinner. She said to her companions at the table "Do you see that we are getting better food? Don't tell me that prayer doesn't change things."

Jen was again carried to be released but the doctor said no! quarantine her with the other girls who have to take treatments. She was given certain pills each day, but knowing that there was nothing wrong, she hid them instead of taking them. After a certain number of days when a certain test was made, the doctor pronounced her to be well. Jen took all the pills from where she had kept them and showed them to the doctor and asked, "What made me well? Here are all your pills?" There was no answer but a great deal of surprise. The writer makes this comment. Jen was not the only person who has been the victim of official mistakes.

The little prisoner Missionary returned to her place with the other girls and women and continued talking to them about Jesus and pleading with them to go straight after they get out of jail. On the final morning of her stay, a call came at nine o'clock in the morning for the little lady to get ready to go home. She was so busily engaged in teaching the Bible to her companions that neither she nor her companions heard the call. During the day, three girls pledged to go back to the church and live better lives. One said, I am here only because I strayed from my mother's teachings.

At two-thirty in the afternoon another call came for little Jen. She heard the second call and answered. When is was explained that a previous call had been made in the morning, an elderly woman said, "That girl must be a Christian. When one call is made for a person and the person fails to answer, they don't call anyone that day and sometimes for several days; but for this girl they have come back the second time today. Yea, she must be a child of God."

As Jen prepared to leave, her companions patted, hugged and kissed her goodbye. She was glad to get out, but went away looking back, having feelings of mingled joy and sadness, praying as she went. She was thankful that she had done some good, and because of that good was willing to be LATE LEAVING JAIL

(The above story is a true account of a lady's experience told to the author of the "BYRD NEST" by the little lady who was actually late leaving Jail.)

The Philosophy of America

Doctor Harold C. Urey, who participated in the development of the atomic bomb, warns that either the United States must secure adequate international control of the bomb or begin preparations for the third world war. Without fuss or furor, military authorities are doing just that—preparing for the next war. It will be the war of the atom bomb.

With such horror threatening them, the American people should take stock of themselves. Just what is it that compels them to choose death if need be rather than face a future under the possible dominance of another nation? The popular slogan of "saying the world for democracy" is not enough. In fact, no catch phrases, including tear-jerking sermons on the four freedoms, are of sufficient spiritual magnitude to cause an individual to step forth willingly to die. Yet something so powerful pervades this land that the people will unhesitatingly choose destruction rather than "appease" those who would have us live other than according to our political ideals.

The challenge of the atom bomb may do more than anything else to restore the American sense of values. False standards cannot live in a nation where the people think seriously. A new understanding of the philosophy that the individual is more important than the state, is long overdue. This is the essence of Christianity. It is this, and nothing else, for which the people of this country are willing to stake their lives.

It is this Christian philosophy of the individual first that we see and feel in the clean morning air in every nook and cranny of the United States as millions of us wend our way to work and play. It pervades every business enterprise big and little. It is the foundation of our government. On Sunday the bells of thousands of churches peal a ringing affirmation. No mere clumsy words can describe this philosophy of America, but it is there for all to enjoy —and it is worth more than life itself.

The Long-Range Railroad Prospect

The transportation shortage should not obscure the fact that the railroads are doing a remarkable job under adverse conditions. During the first nine months of this year the maximum shortage of freight cars on any one day was 24,000—as compared with shortages ranging above 150,000 a day during World War I and the years immediately thereafter before the railroads began, in 1923, their great modernization program which revolutionized freight transportation in this country. The present situation looks serious because we have had nothing like it in over 20 years.

The really serious situation is the long-range prospects. We have the astonishing anomoly of the railroads carrying more freight and passengers than ever before in time of peace—but with costs running so high that they are unable to show a profit. That is the basic reason for the lines' application to the ICC for a rate increase.

There has never been a time in railroad history when the lines were permitted to make as much money as was necessary for meeting current expenses and at the same time carrying on an adequate improvement program in the interest of better and cheaper transportation in the future. One great weakness in public regulation is the interminable length of time it takes to get action in an emergency, and that it tends to hold down profit when there is a chance to make profit, without, at the same time, guaranteeing industry against losses when times are bad

A spokesman for the Bureau of Railway Economics came to the heart of the rate issue when he said: "The question is not whether the country can afford the necessary increase in freight rates, but it is the question as to whether we can afford NOT to have it, if we are to avoid crippling the national economy for lack of adequate, efficient and economical transportation service."

Announce Minimum Wages for Sugarcane Harvesting

The U. S. Department of Agriculture has announced minimum wage rates to be paid for harvesting the 1946 sugarcane crop in Louisiana by growers who apply for payment under the Sugar Act of 1937 as amended.

The basic rate for adult male workers for cutting sugarcane on a time basis is $3.10 per day. This is an increase of 25 cents per day over the 1946 minimum rate. Day rates for other operations provide for a similar increase. Lowest minimum rate for any adult worker is fixed at $2.70 per day. Piece rates have been adjusted to correct apparent past inequalities. Corresponding changes in minimum rates for non-harvest work in 1947 were announced in February.

The Sugar Act requires, among other conditions of payment to growers, that all persons employed on a farm in the production, cultivation, or harvesting of sugarcane be paid in full by growers at rates not less than those determined to be fair and reasonable after public hearing and investigation. The public hearing was held on July 1.

Colored Workers Help Harvest 20-Million Bushel Apple Crop

White and colored farm workers including 1,000 Jamaicans and Bahamians, are harvesting a 20-million bushel apple crop in Virginia, West Virginia, Pennsylvania, and Maryland. Many of the workers were recruited through the farm labor program of Extension Service of the U. S. Department of Agriculture. Although there was some fear earlier that the entire crop might not be saved due to a shortage of workers, Department officials now say that the harvest will be completed by mid-November.

Who Gains?

Reconversion Director Steelman has forecast that the meat situation will be worse during the coming winter. President Truman now indicates his agreement with that gloomy view. So housewives may as well reconcile themselves to the continued contemplation of denuded showcases in the markets they patronize.

The evidence has been pointing in this direction ever since OPA reestablished meat ceilings—against the advice of some of the foremost authorities in the industry. The intake of meat animals in the great stockyards of Chicago and elsewhere had been at unbelieveable lows. And many of the animals received are undersized, of low quality, and are generally undesirable for table use.

We have here a perfect example of what happens when the legal price of any commodity is set at unprofitable levels. During the period when meat was decontrolled, it flowed abundantly into the legitimate channels. Practically all stores had plenty of it to sell in all cuts and grades. Prices, of course, were somewhat higher than before—today's costs made that inevitable. But meat was available. Now prices are lower—but that is meaningless because there is less and less meat on sale.

OPA is supposed to act in the interest of the consumer. But it is difficult to see how anyone's interest is served by a policy which drives products out of the open market and makes them unobtainable to the vast majority of consumers. The packers lose—many of them are almost out of business for lack of animals. The honest retail stores lose, because they have less to sell. The consumer loses, because he can't get what he wants. The main gainer is the black market, which always has plenty of everything to sell at an exorbitant price when government makes the operation of the free market impossible.

The Steel Shortage

There will be a steel shortage for a considerable time to come. One authority estimates that demand for the year ending June 30, 1947, will approach 67,000,000 tons —11 per cent above the probable supply. Steel output will have to be parceled out by the industry on a fair and equitable basis to consumers, with none getting quite as much as desired.

Various reasons are given for this shortage. The most important reason, according to steel men, was the great coal-steel strikes of recent memory. These shutdowns prevented the production of 15,000,000 tons of the basic industrial metal—more than enough to make up the anticipated shortage for the coming year. Thus, the strikes in two industries made enormous inroads into the future production of hundreds of industries which require steel products of one kind or another. And the coal and steel strikers were thus responsible for depriving armies of workers in other industries of full employment.

The big question now is how soon the demand for steel can be met. It is easy enough to suggest that the steel industry embark on a big expansion program. But it takes two to three years to build new capacity. Furthermore, the steel industry, to quote Business Week, "is concerned about what will happen to steel demand once the accumulated backlog for things made of steel has been worked off." Only once in our past peacetime history has demand for steel come within 12,000,000 tons of present capacity. The industry cannot spend millions for plants for whose production there would be no market in the future.

The industry is doing everything in its power to produce all humanly possible to quickly make up the ravages caused by the strikers.

To keep them crispy, don't salt shoestring potatoes until you are ready to serve.

What Does Mr. Lewis Want?

It has been said that John L. Lewis, head of the United Mine Workers, does not favor socialization of the coal industry. This would seem logical, for Mr. Lewis must realize that if government goes into the operation of any industry on a permanent basis, its workers will no longer be free agents, with the unlimited right to strike. However, Mr. Lewis' demands upon the coal mines may, in the view of some authorities, make the future operation of the properties under private ownership dangerously difficult.

The coal mines are now "temporarily socialized." It is presumed they will be returned to private ownership in the relatively near future. During this interim period Mr. Lewis has been appearing periodically with new demands which will add enormously to the cost of mining coal. These demands range from union control of a welfare fund to be provided by the operators, to shorter work weeks and higher wages. It is of great significance that the owners have almost nothing to say in the controversy. The unions and the government decide everything.

The question that now arises is just how high can coal prices go and still find the big and steady market that is necessary to full employment of the miners. Coal must compete, on a cost basis, with other sources of energy. So, if prices are forced high enough, the consuming industries will naturally look around for possible substitutes. And so, in many cases, will household consumers.

The worst part of the whole problem is that most of Mr. Lewis' demands involve increases in the cost of operation—without any increase whatever in labor's productivity. Labor wants more money—but it doesn't want to perform more work, and in some cases it is performing less work. The unanswered question is just how long the American industrial machine and the American consumer can stand the impact of this sort of labor policy.

Artificial Price Increases

The tremendous price rises that have taken place have imposed a serious hardship on millions of people. Additional rises, at least in some lines, are anticipated. These increases are the inevitable result of present-day operating costs.

Now it appears that additional, avoidable and artificial price increases may also occur—because of restraints on the operation of large-scale merchandising organizations which operate with a minimum of profit, and pass maximum savings on to the consumer.

This is the result of the recent Federal court decision holding that the Great Atlantic and Pacific Tea Company, a large national chain, has been operating in restraint of trade and so is guilty of violation of the anti-trust laws. The opinion specifically held that this chain's policy of cutting costs to the consumer to the bone was against the intent of those statutes. If that decision is upheld in the higher courts to which appeal is being made, it is obvious that low-cost merchandising will be outlawed in large part—at the consumer's expense.

No criticism of the judgment of the courts is involved here. It is the judges' duty to hand down decisions based on what the law says, not on what it should say. Remedial action must come from Congress, which is the source of all Federal law.

And certainly, it will be the duty of Congress to change any law which penalizes efficiency, places a premium on waste, and which forces prices to higher levels than would otherwise be necessary.

Start Now to Do That Odd Job

Most farm families could, with a little extra effort at this time of the year, save themselves many uncomfortable hours during the cold winter months. There are jobs on most every farm that will have to be done within the next six months which could more easily be done now while the weather is still warm.

No doubt there are thousands of kitchen flues that need cleaning. These flues are not completely stopped up and might even go through the winter without causing one bit of trouble, but chances are some morning, when the house is completely closed to hold heat, the housewife will find that the stove will not heat. In addition to the house becoming filled with smoke, the children will be forced to go to school without breakfast. The victims will probably lose their tempers in an attempt to unstop the flu.

How many times during the winter when you go into the house cold and half wet from chasing the cows or hogs are you cautioned about tracking mud into the living room? Wouldn't you like to tell some one to jump "into the lake" or some other familiar phrase of the same meaning. In most cases, mud that is carried into the house on the shoes comes from the yard. A little grass seed scattered over the yard now and a few loads of gravel spread on the roads and walks leading to the house will provide a clean surface for walking during almost any kind of weather.

Can you think of anything colder than shucking corn in a crib that is about half-covered with snow which has blown through the cracks, or corn that has ice on it from a leak in the roof. Yet the corn must be shucked to feed the livestock. Maybe you can remove the shuck from an ear of corn with gloves, but we never could regardless of how hard we tried. A few boards would stop the leaks and some stripes over the cracks would prevent the snow from blowing through.

It seems that gutters to the barn invariably fall down at the time water is most urgently needed for the livestock. A little time spent now checking the braces and repairing the connections would no doubt provide a time saver in the long run. Now would be an opportune time to get at least a part of the winter's wood supply ready and repair or rebuild the weak places in the fence.

We don't wish to be misunderstood. We aren't unmindful of the fact there is more to be done on the farm at all times than the average farmer can do in a seven-day week. However, many of the smaller jobs, if completed at the right time, will never develop into larger ones later in the year.

Elsewhere in this issue is a story about a blind dairyman who is making a comfortable living for himself and his family by milking cows. He said it took long hours and hard work, but he had nothing to complain about. He accepts his handicap with contentment; he is depending on no one for support, just as thousands of other blind people in the nation are learning to do through the assistance of the Federal Rehabilitation program.

Wrong Thinking

The kind of thinking which lies behind the Wagner-Murray-Dingell public health bill has been all too prevalent of late years. It is based on the proposition that the proper way to meet a national problem is to appropriate a few billion dollars, create an enormous bureaucracy, and give the government unlimited powers of policy and administration.

That may seem the easy way. But the whole history of our time is a demonstration of its fallaciousness. The terrible wars, depressions and other social and economic upheavals which have dominated the world have been the direct or indirect result of the conflict between free government and dictatorial government. And the greatest problem facing the peoples of the world now is whether they are to have freedom or oppression.

It may seem extreme to contrast world conditions with proposed legislation which applies to this country alone. But the parallel exists. If we are to go to the point where government must do everything for us, where we must have cradle-to-the-grave security in all its ramifications, where we confess ourselves impotent to deal with our own personal problems, our position as presumed leaders of a free world will be untenable.

So far as medical care is concerned, a problem does exist—despite the unchallenged fact that our standards in this field are the highest on earth. But that problem is being steadily and soundly solved through public cooperation, in such public questions as control of tuberculosis and venereal disease, and by rapidly expanding voluntary insurance plans for individual protection in the event of illness or accident.

The American people can certainly take care of their health standards without spending four to six billions a year to regiment the doctors and socialize the practice of medicine.

How Much Food Do We Waste?

Waste in the Public Eating Place

The American public eats 55 million meals a day in public eating places. Estimates are not available on the food waste under the control of restaurant management—through inadequate facilities, poor cooking, overstocking, over production, or inexperienced help, but it is estimated there is a 6 percent or larger waste in food left on plates by restaurant patrons.

The operator of a public eating place has a threefold task:

1. Educate his kitchen and service personnel on the ways and means of saving food in the kitchen. (Here, factors in food wastage and the means of correcting them are much the same as those which apply in the home kitchen.

2. Offer his patrons menus which are less elaborate and at the same time varied and well-balanced. (It has often been shown that the public is more interested in quality than in quantity of choices offered.)

3. Assist in educating his patrons to order only what they want and to eat everything they purchase.

Waste in the Home

Americans eat more than 135 billion meals a year. If these meals are poorly planned, not prepared well, and are not all eaten, if left-overs or remains of too large portions are not utilized, the door is left open for tremendous waste.

On the next few pages are listed major failures of planning that cause waste and some ways in which this loss can be eliminated.

Waste in the Planning of Meals

1. Failure to take full advantage of foods in seasonal abundance, especially perishable, results in waste. Proper planning not only saves the full nutrient value of the fresh crop to the consumer, but also saves foods which may be used when perishables are scarce.

2. Planning meals ahead cuts down waste in the home due to lack of storage space. There is no sense in buying foods for which there is no room in the refrigerator and for which there is no other adequate storage facility.

3. Failure to plan on the basis of required nutrients causes waste. If a housewife serves more carbohydrates or more proteins food than are necessary at the expense of vitamins and minerals, and unbalanced diet results. For example, if both potatoes and spaghetti are served at the same meal, either one may only be nibbled at and the remainder thrown away. Each day's food should include some of each of the Basic 7 food groups. This balancing makes for better health and better appetites for each of the foods served.

4. If the same dishes are served for a period of days they become less appetizing. The result is wasted food and often a waste in food values.

Waste in Marketing

Hand in hand with planning goes the right kind of marketing. This yields better nutrition, more for the consumer's money, and a tremendous saving of food.

1. Buying too much means dangerous spoilage and loss. Many foods deteriorate in nutritional value the longer they are held, so even though they are eventually eaten there is a waste of food values. It is better not to buy the 2-for-49-cents special if the quantity is likely to be too much to eat before it spoils.

2. You cannot judge the nutritional and taste value of all food by its appearance. Many tons of fruits with slight blemishes are thrown away because their appearance has not appealed to the customer, although in taste and food values they are equal to the most photogenic pears, peaches, etc. The retailer cannot sell them. They rot, contaminate other fruits and are thrown away. This waste adds to the cost of perishables purchased, because the retailer has to average the good with the bad and charge a price to cover wastage.

3. Great waste occurs when merchants, in order to make leafy vegetables showy, tear off the outer leaves. The outer leaves are higher in vitamin content than the inner. The use of the vegetable brush, good storage, and prompt preparation will give more food value, better taste, and save waste.

4. A good rule for shoppers is "hands off' when it comes to pinching and prodding and otherwise injuring sound fruits and vegetables. Such treatment often causes rot and results in waste.

5. The habit of week-end buying causes waste. Merchants stock up to meet the demand, and if their calculations are wrong, left-over perishables rot by the following Monday. The homemaker who makes week-end purchases is inclined to overstock and spoilage results at the consumer level.

Waste in Food Storage

Lack of information on proper storage methods causes waste. Simple precautions will eliminate much of this —especially when available refrigerating space is small.

1. Left-overs in the refrigerator lose their moisture and flavor unless properly covered. Dairy products left uncovered absorb odors of other foods.

2. Meats often spoil unless placed in the coldest part of the refrigerator.

3. Forgotten foods shoved back in the ice box too often end up in the garbage can. A daily inventory of the ice box is a food saver.

4. All foods do not require immediate refrigeration, so the ice box need not become a catch all. Millions of dwellings have cellars suitable for storage of certain foods. A properly sunken and covered barrel or box in the back yard makes excellent storage space for root vegetables like potatoes, carrots, turnips and beets.

Frequent inspection of packaged goods saves waste. This eliminates potential damage from insects and mice.

Waste in the Preparation of Food

Food values can be completely lost in cooking. For example, paring away from one tenth to one fourth of the potato results in physical loss. But in addition, iron and vitamin C in the potato are dissipated by not cooking with the jacket on.

Most housewives still cook vegetables in too much water—and drain off the water and pour it down the sink. This wastes vitamins and minerals which seeped out of the vegetables into the water.

Nutrition value and flavor in vegetables like cabbage and turnips are lost by too long cooking.

We throw away the leaves of cauliflower, cabbage, endive, and chard, overlooking the nutrient value they add to stews and soups.

Much waste occurs because the housewife fails to try recipes which would make some of the less popular vegetables more appetizing.

Many housewives throw out left-overs or withhold their best efforts on them because they lack the knowledge of proper preparation methods.

Waste at the Table

The most obvious waste of food in the home takes place at the table. The actual cause of much of this waste lies in the planning, purchasing, storage, and preparation of food. But part is caused also, by prevailing table habits.

We resist "new" or unfamiliar foods. Uneaten portions are left and are wasted—and the unpopularity of the experiment acts against future purchases of the product.

In wartime, when the shortage of many familiar foods increases the importance of alternate foods, such traditional notions of what is good and good for us, may mean the difference between good health and indifferent health.

As adults some people rebel against foods which were forced on them as children.

Many of us have grown up with the notion that salad greens are "rabbit food," while some housewives consider leaf lettuce, parsley and water cress only as decorations for the salad. These are, in fact, good sources of vitamin A.

We serve on the table more food than we can eat, because it's pleasant to have more than enough. We urge on our guests more than they want, because we like to play the generous host and hostess.

An extravagant code of table manners is another cause of waste of food—not squeezing grape fruit for the last bit of juice, not tipping soup bowls for the last drop of soup, not picking up chops and chicken bones in our fingers, etc. There is a shortage of fats and butter, yet some of us seldom think of soaking up the gravy on our plates with a small piece of bread. Some leave a little dessert for appearance's sake. Although such practices may have been justified before the war, they can hardly be justified now, when food is scarce at home and when hundreds of thousands of our civilian allies are starving.

THE SOLUTION

The success of the Nation's program to reduce food waste in the home lies in educating people to take a number of actions. Here are 10 basic ways of saving food in the home.

1. Choose your foods from the Basic 7.
2. Plan your meals by the week.
3. Buy seasonals; try new foods.
4. Store perishables with care.
5. Prepare food without any waste.
6. Simplify table manners—we're at war.
7. Pledge your family to "clean up the plate."
8. Save the left overs—make them appetizing.
9. Share or preserve your Victory Garden surplus.
10. Help harvest the community crops.

If these basic steps in the domestic food-conservation program are adopted by everyone, food will be saved, people will eat better, and victory will be that much closer.

INFORMATION OBJECTIVES

1. To Everyone

A fact which is important to everyone in America is that there will not be enough food this year or for several years to satisfy all of the claimants for it—even though farmers have broken all food-production records and are going to produce to the limit next year.

When people realize that a few simple conservation measures at home can actually increase the food available for family consumption, they will gladly take necessary action.

Hence it is necessary to instill in every one a deeper respect for food ——the same respect which the English, the Russians, the Chinese, and the starving millions in the occupied countries have for their food. That will not be easy, for until recently, food—lots of food and the kind of food desired—had been available to anyone who had the money to pay for it.

To alter public habits and attitudes toward foods calls for dramatizing the many ways food can be conserved. We need to enlarge people's concepts of what is edible —— to encourage new ideas of what is palatable. This calls for changes in eating habits of many years' standing. It also means persuading the housewife to prepare all of the produce that can be made edible——persuading her and her family to eat all of each portion taken on the plate.

2. To the Homemaker

The key objective in the information program on food conservation is the homemaker. She plans meals, buys food, prepares it, serves it, and stores it for later use. She can do more toward conserving our food supply than any other individual. Alteration of her attitudes and practices will influence her family and other people with whom she comes in contact—the grocer and the restaurant operator.

3. To the Children

Enlisting the aid of young people in conserving food requires a simple, direct, and understandable approach, coupled with suggested action which can be easily carried out.

Such action is the "clean your plate" practice. It is simple. It appeals to children because it makes them feel they are participating in an important project.

To "clean your plate" idea fits logically into the whole conservation program, but by itself it will do little good unless it is linked with conservation practices in the buying, cooking, and serving of food.

Quality Seed Potatoes Will Increase Yield

By John C. Clark

Good seed potatoes are in great demand by many farmers in Tennessee. It is the idea of many growers that they should obtain imported seed stock to maintain the No. 1 quality sweet potato demanded by the market.

There are other growers who think any kind of sweet potato bedded will produce satisfactory plants. Sweet potatoes are like any other crop and are even compared to livestock because selection of desired characteristics true to variety or breed is always necessary to continue quality production.

There remain a few growers who have produced their sweet potato crop and selected their own seed for a number of years and have maintained a good yield and quality Nancy Hall potato. The market demand has gradually changed from the Nancy Hall to the Porto Rico variety and our growers are turning gradually to the greater demanded variety. The Unit I Porto Rico potato is being grown more by Tennessee growers. The true type Unit I Porto Rico sweet potato has a red copper skin with a pink salmon color flesh.

Field selection of seed potatoes is the most desirable way to maintain quality and yield and prevent seed stock from "running out," so to speak. By hill selecting the vine may be checked for disease and split the vine, if necessary, to assure the grower that stem rot is not present.

When making hill selections discard any potato showing any black color, presence of decay or injury. Each potato should be examined for its shape, true skin color and chipped at the end or on the side near the stem end for internal color. When chipped at harvest time for color the cut will heal and keep better than stored potatoes in the spring. The size of the potato should be considered and use No. I or good No II potatoes to get the desired vigorous plants. The small stringy potatoes are not recommended for plant production because the plants produced are weak and tend to be long and stringy.

Each grower should make his field selections and keep enough seed to take care of his own acreage. In this way there is less chance of disease being spread which might be detrimental to the crop.

Potatoes should be handled very carefully and not bruised when going into storage. Harvest seed potatoes before frost to prevent any chances of being chilled. Store, if possible, in crates and separate the seed from other potatoes. When stocking the crates for storage, leave about four to six inches of ventilation space between the crates and the wall.

With good seed bed conditions and selected potatoes, six or seven bushels will provide enough plants for one acre. The selection of good quality seed potatoes and proper storage will mean greater yields and income. With a little extra effort in selecting seed stock, our sweet potato crop will increase in quality and quantity.

Negro Agricultural

(Continued From Page 1)

keting Service Act----The National School Lunch Act is another enactment of the recent Congress which fits into this account on wider distribution."

Will It Be "Boom and Bust?"

In a thoughtful article, David Lawrence observed that our economic system is out of balance due to the war—and has been kept out of balance by the Administration's "floundering policies on wages and prices and by the tendency of labor union politicians to be shortsighted. Their increased wage demands without increased production are backfiring in the form of high prices which, in turn, will backfire because the prices in many instances will be too high for the public to pay.

"The vicious circle has to end somehow. It can end in one of two ways. Either a depression will come which will open the eyes of the people, including shortsighted labor leaders. Or else leadership will arise from government or Congress or the ranks of labor to apply restraints on the arbitrary use of economic power . . . The policy of . . . encouraging 'more pay for less work' has been disastrous."

We are hearing much talk of "boom and bust" now, and it is coming from responsible circles. It is reported, as a typical example, that automobile makers are becoming definitely worried that the greatly increased prices for cars will prove to be a strong sales depressant. And these higher car prices like all other prices, are mainly the result of big increases in pay to labor with an actual decrease instead of an increase in labor's productivity.

We're moving swiftly toward some kind of a climax. Labor should begin to wonder just what its unbridled demands may do to it in the future.

Two things a man should never be angry at: What he can help, and what he cannot help.

"Changes In Farming

(Continued From Page 1)

700 tractors on southern farms and 3,072,000 on all farms.

Tractors are spearheading the drive for wide-scale mechanization in the South. Closely behind the tractors are the mechanical cotton chopper and the cotton picker. Two years ago on a Mississippi Delta farm, 42 acres of cotton were planted, cultivated, weeded, and picked by mechanized equipment as an experiment. Sixty-two bales of cotton were harvested from the 42 acres. Savings in picking alone amounted to $24.82 per bale, or $1,538.84 for the 62 bales.

Farmers who used mechanical cotton choppers this year say that they were able to chop their cotton at the rate of about one dollar an acre as compared with $4.50 per acre by hand labor. While only a few farmers now have mechanical cotton pickers, scores of white and colored farmers are using two row tractor-drawn cotton choppers and various other mechanical devices to weed their cotton.

The shift to mechanization in the United States has released about 55 million acres of cropland from the production of workstock feed since 1919 and made these acres available for the production of marketable crops. It also is lessening the drudgery of farm work and at the same time enabling farmers to perform critical farm jobs with greater dispatch. For example, beating the weather at planting and harvesting time, and. getting the jump on insects and plant diseases with multiple-row power sprayers have contributed substantially to increased production.

With tractor and power equipment, the report points out, three acres of land can be prepared and planted to corn during the time that one acre is planted with work animals. If the tractor is put on a 24-hour schedule, which is not feasible with work animals, the preparation and planting job can be done seven times as fast as with work animals. However, assuming that the acreage of cropland remains reasonably constant, tractor power not only means the displacement of work animals, but also of farm hands The report says that the impact of mechanization will have far reaching repercussions on production and on the number of workers that will be needed in agriculture.

Don't Expect the Impossible

Almost daily, the OPA is issuing orders permitting price increases, and the decontrol board is gradually freeing various commodities from control. Just when does your merchant enter into this chaotic price picture?

In the first place, don't blame the storekeeper for higher prices. He must pay the going level of wholesale prices, add the cost of doing business plus a little profit, and sell to you for the total. Neither chains nor independents have any control over prices at the source.

What the merchant can do is to minimize increases at his level. He can do that by reducing waste, by increasing efficiency, and by holding the margin between what he pays and what he charges, at the lowest possible point. And that is precisely what progressive merchants are and have been doing. A very, very small part of the dollar you spend stays with them—the bulk of it goes for buying goods and paying the overhead.

Today's prices are simply the reflection to today's conditions. The typical store is serving you to the best of its ability, and at minimum cost. But it can't hold prices down when everything costs more. It can't stock an abundance of goods when production is lagging. It can't, in short, do the impossible.

FLAME CULTIVATOR on display at the Stoneville, Mississippi, cotton experiment station. County Agent Charles H. Burton, center, shows Edward Scott and his four sons how the flame cultivator is operated. Mr. Scott who is a 900-acre cotton farmer of Drew, Mississippi, has 25 tenants on his farm. Says he will mechanize if his tenants leave him.

President Appoints

(Continued From Page 1)

trator of Farm Security.

Mr. Lindsey has been with the Farm Credit Administration for the past fourteen years and has had wide experience in the field of agricultural credit. It is expected he will be concerned with similar credit functions in the new agency.

Mr. Hudgens is a veteran of World War I and has been with Farm Security since its early days. He served as regional director in the Southern States and came to Washington as assistant administrator. He has been associate administrator since early in 1944, giving special attention to field operations.

FARMERS HOME ADMINISTRATION

Credit facilities and services of the Farm Security Administration are to be transferred to a new agency, the FARMERS HOME ADMINISTRATION, on November 1, 1946. During the interim, the work of FSA is being carried on under the name Farm Security Administration and without changes in program, methods, or loan terms.

Public Law 731, Seventy-ninth Congress, (the Farmers Home Administration Act of 1946) approved by the president on August 14, 1946 authorizes credit services under the Secretary of Agriculture for farmers who cannot get the loans they need at prevailing rates (but not more than 5 percent) and terms in their communities from banks, cooperative lending agencies or other responsible sources.

The Secretary of Agriculture, in accordance with the Act, has established the FARMERS HOME ADMINISTRATION within the Department of Agriculture and directed that the functions of the Farm Security Administration be transferred to it within 90 days. The Emergency Crop and Feed Loan Division of the Farm Credit Administration also will be transferred to the new agency.

The Farmers Home Administration Act of 1946 which amends the Bankhead-Jones Farm Tenant Act authorizes the following types of credit:

Title I.

(a) **Farm ownership loans** up to the reasonable value of the farm and necessary improvements, to buy, repair, improve or enlarge family-type farms. Loans may not be made for the acquisition or enlargement of farms which have a value, as acquired, enlarged, or improved, in excess of the average value of efficient family-type farm management units in the county or locality where the farm is located. These loans are repayable over a period of 40 years at 3 1-2 percent interest.

(b) **Insured mortgages.** THE FARMERS HOME ADMINISTRATION is authorized to insure 40-year loans by private lenders for the same purposes as the farm ownership loans. The amount borrowed can be up to 90 percent of the reasonable value of the farm and necessary improvements. Insured loans bear an annual charge of 3 1-2 percent, the lender receiving 2 1 2 percent interest, and the Government 1 percent for insurance and administrative expenses. (Funds for mortgage insurance have not been appropriated).

Title II.

Production and subsistence loans up to $3,500 for buying livestock, seed, feed, fertilizer, farm equipment, supplies, and other farm needs; for refinancing indebtedness and for family subsistence. This operating credit will be for periods up to 5 years, at 5 percent interest. The loans are similar to the rural rehabilitation loans previously made by FSA and include supervisory services.

Veterans who served in the U. S. armed forces in any war with another nation will have preference for direct and insured mortgage loans. Disabled veterans will be eligible to buy, repair, or improve farms adapted to their capacities, provided their farm income plus their pensions will be enough to pay living and operating expenses and retire the debt.

A special condition under which all loans are made requires that if at any time it appears to the Secretary of Agriculture that the borrower may be able to get a similar loan from a cooperative or private credit source under terms prevailing in the area, and at an interest rate not exceeding 5 percent, apply for such a loan and, if granted, accept it and pay off his debt to the FARMERS HOME ADMINISTRATION.

Oklahoma Rebukes Socialism

In Oklahoma where a lot of pressure has been put on the residents of local towns to take on electric service from publicly-owned or publicly-subsidized electric systems, some astonishing results have been reported in local elections where the question of renewing the franchises of a private power company came up. Evidently residents of Oklahoma realize the advantage of highly-taxed private enterprise to a local community as contrasted with tax-exempt public business which repletes the local tax rolls and public treasuries.

Three towns have just recorded their vote in no uncertain terms for twenty-five-year franchises for the local power company. Gore voted 135 to nothing, and Webbers Falls, 175 to nothing. Arkoma voted 309 for, to 3 against a franchise.

That kind of a vote is a rebuke to socialism in the power field, and encourages private enterprise and private investors to go ahead with a feeling of security in building up tax-paying industries and assets in local communities. Other states can well take a lesson from these Oklahoma communities in encouraging local private enterprise.

30,000 Pounds Of

(Continued From Page 1)

ture have made so far this year in an effort to determine what improvements ean be made in the construction and the method of insulating refrigerator cars and which type of car is best adapted to the movement of various kinds of fresh fruits and vegetables and other perishable freight.

Plan Now

To sow the lawn in rye grass in time for it to get at least some growth before cold weather.

To kill no "skunks" on the farm. One little animal of this type is worth more to the farm than the average dog.

To lower the number of accident hazards on the farm by hanging each place of used bailing wire in a safe place.

To prevent washes and gulleys from becoming worse during the winter by filling them with brush or some other waste material that will reduce the amount of erosion.

To make each week Fire Prevention Week on your farm.

To use care in feeding grain. Even though the supply is estimated to be 10 per cent above last-year's supply, it is too expensive to waste.

To increase your income from tobacco by correctly grading it before placing it on the warehouse floor.

To vote in the tobacco marketing quotas referendum October 25. That is when tobacco growers will decide whether they will produce under government regulations during the coming year.

To increase the production from your farm flock of hens by keeping them housed during severe weather.

To be ready to save those remaining vegetables in the garden the afternoon before the first killing frost. A several weeks' supply of such vegetables as tomatoes, peppers, corn, beans and squash might be saved.

To use sound judgment in both buying and selling in the few months ahead. This is definitely no time for specaculating.

To increase your efforts in controlling rats. The average farmer annually loses enough grain because of rats to feed two hogs.

To make your sheep more profitable next spring through better care and management this winter.

To stack the fire wood so it will keep dry.

Income Tax Filing Data Given Farmers

Practically all farmers are required by law to file an income tax return or a declaration of estimated tax; and to pay the tax or estimated tax, if any is due, on or before January 15, 1947, E. P. Callahan, assistant farm management specialist, U T College of Agriculture, said today.

The return may be filed between December 31, 1946, and January 15 1947; or the declaration of estimated tax may be filed any time before January 15, 1947, covering the year 1946. In either case, declaration of estimated tax, or actual return, good records on the farm business will be needed.

Also any farmer who pays one employe wages totaling $500 or more during 1946 is required to notify the Bureau of Internal Revenue of such payments on or before February 15, 1947. This report must be made on Forms 1099 and 1096, which can be obtained from a Deputy Collector of Internal Revenue.

Any farm hand, tenant or sharecropper whose gross income in 1946 is $500 or more is also required to file a declaration or a return by January 15, 1947. This applies even though his wages or other income are not subject to withholding.

The Truth about Transportation

In the long run, the transportation shortage now facing the country can be solved by only one thing—greatly expanded purchase of new equipment by the railroads. Expansion by other forms of transportation, while desirable, will be of only minor importance. Railroads, and only railroads, can handle the great bulk of freight traffic.

Railroad purchases depend upon the railroad's ability to earn enough money to buy the needed cars and locomotives and other facilities. And that, in turn, depends upon a railroad rate structure which will truly reflect today's prices and operating costs. It is obvious that no industry can pay 1946 wages and material costs while charging 1940 prices for its services.

That is why the Interstate Commerce Commission's most recent delay in acting on the railroads' request for higher rates is of great seriousness to the country. This delay occurred when the Commission ordered the railroads to furnish it estimates of traffic, earnings, expenses, taxes, income, etc., for the years 1946 and 1947. As one authority said, "The Commission and members of its staff . . . can estimate now better than anyone else, on the basis of present trends of traffic and operating costs, how much net operating income the railways will need . . . Why, then, while the transportation situation grows steadily worse, does the Commission continue fiddling and procrastinating . . .?"

The ability of the country to pay higher rates is obvious. The wholesale prices of all commodities average 40 per cent more than in 1940. Railroad rates average about 6 per cent more, and that increase only came into effect last July 1. And the railroads cannot meet the demands placed upon them without reasonable additional increases consonant with current conditions.

6,000 Veterans Get Loans Through Farm Credit

Over 6,000 white and colored veterans received loans through the Farm Credit Administration of the U. S., Department of Agriculture during the first six months of 1946, I. W. Duggan, FCA Governor reports.

The number of veterans borrowing from local associations of FCA during the first half of this year was two and one half times larger than the total number who received loans during the entire year of 1945

Production credit associations made operating loans amounting to $10,250,000 to 4,853 veteran members between January 1 and June 30. During the same period, Federal Land Bank and Land Bank Commissioner loans totaling $5,170,000 were made to 1,214 veterans in long term loans through farm loan associations for the purchase of farms.

In addition to these, about 10,000 veterans of World War II have received loans from the Farm Security Administration of the Department of Agriculture.

The Other Side of the Picture

For many years, the government's fiscal policy has been largely based on the John Maynard Keynes theory of economics. At one time, Mr. Keynes conferred with the late President Roosevelt. The theory is extremely complex in detail, but its essence is simple—that the government should prime the pump to maintain employment and production in bad times. A good practical example of this was the WPA in depression days.

Without debating the merits of Mr. Keynes' economic principles, it should be obvious that there is another side of the picture. If government is to spend beyond its income in bad times, it must spend less than its income in good times in order to reduce the debt and create surplus capital and credit for future use when needed. And that side of the picture is what we have completely failed to see in this country. We are in some kind of a boom, employment is beyond the 60,000,000 job level urged by Mr. Wallace—and we're working on the largest peacetime Federal budget in our history.

To talk about economy isn't to practice economy. And Washington has lately been full of talk which has been accompanied by practically no action. We're still throwing our money and our substance away on unnecessary dams, on the perpetuation of bureaus whose life should be ended, and on a million and one other pork barrel schemes.

This is the road to perpetual inflation, to the untimate destruction of the dollar, and to an eventual economic collapse almost beyond comprehension. And only courage and resolution can stop it.

Some people seem to look at life in a mirror—they get everything backward.

TVA Wants More Favors

Reconversion Director John R. Steelman, at the President's direction, recently ordered a curb on awarding non-essential construction contracts, with a view to combating inflation and releasing materials for home building.

Shortly thereafter, says a press dispatch, the chairman of the Tennessee Valley Authority wired asking that TVA be exempted from this order.

Here is an example of the bureaucratic mind at work—and here is also proof of the fact that economy in government will be impossible unless the strongest kind of pressure is exerted from the top. Every department head believes that his bureau is indispensable to the country, and that its activities should be ever extended and never curbed. Economy may be all right for the private citizen—but it must not touch public projects or public payrolls.

Just why TVA should be exempt from Director Steelman's order is a puzzler. The Authority has principally distinguished itself as an insatiable spender of tax funds. Long before TVA, the region it covers was given electric service by the private companies which it later destroyed. One of the principal things TVA did was to help run up the public debt—and to deprive states and local communities of the heavy taxes which had previously been paid by the private utilities.

Every government activity should be forced to retrench in every possible way. And the biggest retrenchment should be on the part of just such agencies as TVA, which are operating in fields which are the proper province of taxpaying business.

Dairying Cited as Top Money-Maker in South

Memphis, Tenn., Oct. 7—(AP)—Dairying is slated to replace cotton as the biggest money maker for the southern farmer, perhaps "within a decade," says Charles W. Holman, secretary of the National Co operative Milk Producers Federation.

Addressing the Mid South Milk Producers Association here last night, Holman declared the South had gained more than any other area in the nation in milk, production since 1924.

He said the gain was 60 per cent, adding: "That's not enough—for the South, now importing much of its supply of dairy products from other states should be at least self-sufficient and it can be."

Finds Sheep Profitable

"The only thing that will keep a farmer from making money from sheep is just not trying," Estes Hart of Breckenridge County, Ky., recently told County Agent Kenneth A Brabant. Eight years ago Hart paid $7.50 each for 50 ewes and in the meantime has sold an average of $15 worth of wool and lambs per head per year. This season he sold wool and lambs for an average of $24 per ewe and then sold the old ewes for $12 each.

How Much "Social Security" Can We Pay for?

The cost of compulsory medical insurance, the kind envisioned by the pending Wagner-Murray-Dingell Bill, has been estimated in a report prepared by the Social Security Board for the Senate Committee on Education and Labor. It makes astonishing reading, even in a time when we deal with billions as casually as we used to deal with millions.

If coverage is limited to 100,000,000 persons, the estimate says, the initial cost would vary from $2,600,000,000 to $2,880,000,000 a year.

If national coverage, for the entire population of 140,000,000 was established, the initial cost would run from $3,630,000,000 to $4,030,000,000 a year.

Ten to fifteen years later the cost would increase because of the expansion of certain services, such as dental and home nursing. Then, estimates the Board, for a limited coverage on 100,000,000 persons the cost would vary from $3.520,000,000 to $3,89,000,000 a year. And if all the people were covered—and there's certainly no apparent reason why any group should be left out of so grandiose a scheme as this—the cost would vary between $4,930,000,000 and $5,450,000,000.

In the opinion of some authorities, the cost would be very much higher—perhaps $6,000,000,000 or more. At best, a system of compulsory medical care whose benefits are purely speculative, and which is regarded as actually inimical to the public health by many distinguished medical men, would cost the workers, employers and other taxpayers of this country some $4,000,000,000 a year and probably more.

One wonders just how many forms of cradle-to-the-grave "social security" we can have before all our income will have to be taken to pay for it.

Make Buildings Safer

For many years the National Board of Fire Underwriters has waged a relentless campaign for building codes requiring construction which prevents the rapid spread of fire. But the public generally is apathetic except after a fire tragedy.

Two disastrous hotel fires may now bring further action in the interest of fire prevention. Defects in construction and poorly guarded common hazards are principal factors contributing to the rapid spread of fire and loss of life in hotel fires.

In the booklet entitled "Fire Prevention and Protection as Applied to Hotels", which applies with equal force to apartments and rooming houses, the National Board says: "The most serious defect of older hotels is unprotected floor openings—stair, elevator and dumb waiter shafts. In many instances fire stops are lacking at the base and top of interior partitions and the points where flues and chimneys pass through floors. These openings act as flues for heated gasses to rise and spread throughout the building.

"The story of practically every large hotel fire is primarily one of weak, combustible construction with these unprotected vertical openings serving as the principal cause of the rapid spread of heated gasses, smoke and flame to all parts of the building.

"The layman will undoubtedly view with surprise the statement that very few people are actually burned to death in fires. In most cases death has been caused by the inhalation of heated toxic gasses. This danger exists even in fire proof buildings if these vertical paths for flame and smoke exist."

To promote fire safety, the National Board of Fire Underwriters, 85 John Street, New York 7, N. Y., offers without charge to interested parties its booklet "Fire Prevention and Protection as Applied to Hotels."

Sincerity means that our words and behavior tally with our beliefs. **Reality** means that our words and actions and beliefts tally with the truth.

Dr. Ralph W. Sockman.

Kilowatts Instead of Candles

The private electric utilities pioneered rural and agricultural electrification. And the private utilities are the leaders in present drives whose purpose is to eventually provide service to all the farms and rural communities in the United States.

Grover C. Neff, President of the Wisconsin Power and Light Company recently disclosed some interesting facts. At the present time, three-fourths of the nation's 5,550,000 occupied farms have been reached by electric service—that is they are now being served or are within a quarter mile of existing lines and can secure service on application. Electric operating companies serve at retail about 60 per cent of the connected farms, and through wholesale contracts supply a large part of the power used by the remaining 40 per cent.

Surveys made by the Edison Institute indicated that during the three year period, 1946 48, a total of 1,240,000 new farm customers will be added to the lines. Thus, at the end of 1948, if the utilities and other agencies involved are able to obtain the needed materials, at least 5,000,000 farms will be connected or have service readily available. Then less than 500,000 scattered farms will be without service, and many of these will have home generating plants of their own to supply their power needs.

This is a record of which the country can be proud. More power on the farm means less work, higher productivity, and a greater economic return for the farm family. And we should never forget that the big part of the job has been and is being done by private, regulated, heavily-taxed businesses.

Public Health

One basic trouble with such sweeping measures as the proposed Wagner-Murray-Dingell public health bill is that they attempt to do too much too fast.

This bill for instance would give Federal government all-inclusive power over medical practice, including doctors, hospitals and clinics, at a huge and untold cost, on the theory that the public health would be greatly improved.

The truth is that public health is not a matter of medical care alone. For the most part, the doctor steps into the picture when the patient becomes ill. His job is to cure. The ideal of better public health requires that the conditions which create illness be prevented. And this involves such huge problems as diet, housing, recreation, working conditions and so on down a long list.

A study recently made by the Insurance Economics Society of America reveals the enormous fluctuations between the forty-eight states in population, medical facilities and other matters related to health. The health problems of one locality, or one age group, or one income group, differ greatly from those of another. As the survey observes, "No matter which conditions we undertake to improve, we would waste part of our effort if we blanketed the country with a packaged program."

We have taken long strides in bettering the public health. Great progress is now in the making, and the effects of such programs as the various Blue Cross plans, prepaid medical care and individual and group health insurance are entirely beneficial. Voluntary activities like these instead of measures which would virtually socialize medicine, point to the proper road.

All States to Take Part in School Lunch Program

Nation wide participation in the National School Lunch Program is assured now that all 48 states, the District of Columbia, and the territories have signed agreements covering the operation of the school lunch program with the U. S. Department of Agriculture.

Officials estimate that at least eight million youngsters in 46,000 schools will receive lunches this year.

Negro Farmer Is Acclaimed for Balanced Farming Program

Dave King, colored farmer of Cass County, Texas, has been acclaimed for his balanced farming program by The Extensioner, official publication of Texas Extention Service.

In its lead article, written by the editor, Miss Laura Lane, the publication features the farming achievements of Mr. King in one of its recent issues.

Carrying out a diversified program, Mr. King has several sources of income on his 61 acre farm: Elberta peaches, pigs, calves, white potatoes, cotton, purple hull beans, watermelons, cucumbers, certified Puerto Rico sweetpotato slips, sugarcane and sorghum. Every year he makes between 300 and 400 gallons of syrup and says he's the best syrup maker in his county.

The article points out that Mr. King believes in phosphate and winter legumes. This year, most of his white potato crop—one of his principal cash crops—followed vetch which had been phosphated and turned under. Without the vetch and phosphate, he says, it is extremely likely that his potato crop would have been a failure.

Mr. King who believes in keeping records and in maintaining his home and farm buildings and fences in good repair. When hogs are killed he weighs them and apportions his meat supply to his family of 13 on a week to week basis over the entire year.

As for his home and farm building Mr. King spent $524 last year painting and repairing his home, and put a new roof on his barn at a cost of $118.

Farmer King is one of the 15 Extension farm unit demonstrators in his county and his neighbor's look to him for guidance. His leadership is said to be an important factor in the increased emphasis which colored farmers in his county are now placing on sound soil conservation practices and greater diversification of farm crops.

Increase Support Prices of '46 Sweetpotatoes

The U. S. Department of Agriculture has announced an increase in support for prices for the 1946 sweet potato crop. The new loan settlement rates and the prices at which purchases will be made have all been increased 5 cents per bushel over the rates announced on March 28. The new prices are designed to support a price to growers at not less than 90 per cent of parity as of July 1. However, no change has been made in the loan rate which remains at $1.50 per hundred pounds.

Live and Learn

Our dogs can teach us many things. We should observe them carefully, be it climbing a high wall or finding their way home from long distances.

A dog will keep trying until he makes his objective or drops with exhaustion. His patience is almost unbelievable. A dog will bear pain with great fortitude and wait patiently for relief. He will sit quietly for hours awaiting his master's return, never taking his eyes away from the place he last saw the beloved person.

Their gentleness with children, their forgiveness of harsh treatment, set examples for all of us. They are faithful unto death, heroic without thought of reward and alert to all that goes on around them. The capacity for love that is possessed by dogs is almost beyond understanding. It is truly said that here is the only love that money cannot buy.

—Los Angeles Times

STEER GAINS BOOSTED

Steers running on pasture that had been fertilized with rock phosphate and limestone gained three times as much as steers running on untreated pasture, in test at the Western Kentucky Experiment Substation at Princeton.

That $50,000 Dog

"Webster defincs price as, among other things, 'the amount at which actual current transactions take place in the market,'" says the Saturday Evening Post editorially. "But popular discussion of inflation and the cost of living have lured supposedly authentic observers so far off thc beam that they have been using the word 'price' with as little relation to reality as the man who said he had just sold a dog at a price of $50,000 but had to take two $25,000 cats in trade."

It is a very simple matter to fix a ceiling price for anything at any level the OPA desires. It is an entirely different matter to make goods available to the public at that price. If, to producers, the price is too low, the item in question will automatically go out of production or be shipped off into the black market, to the detriment of the honest merchant and his customers. This has happened periodically in the case of meat, especially beef. When the OPA set the price of certain types of low-cost clothing at an unprofitable level, manufacturers just stopped making that kind of clothing, and concentrated on higher-priced goods which would return a profit.

We will never have adequate production in this country until the free market is re-established. In that market, competition and the consumers' desire and ability to pay will fix the price level. Artificial price ceilings, which are out of key with current labor, material, tax and other operating costs, will do nothing in the long run but perpetuate an economy of scarcity.

Farmers Urged to Aid Metal Collection Drive

Farmers can make a sizable contribution toward production of new farm machinery by turning in every possible bit of scrap from their farms, officials of the U. S. Department of Agriculture said today. While not all the scrap iron and steel gathered from the farms will be used exclusively for farm machinery, any metal made available to the steel mills will aid in all lines of production.

The scrap collection drive, which will run some three months, will tap every source of scrap metal. Many governmental agencies, and the Army and Navy are contributing to the drive. It is pointed out that the steel industry will require two million tons of scrap iron and steel a month for the next six months. The steel industry desires "heavy melting scrap"—castings and heavy pieces found on farms.

The Civilian Production Administration has requested farm machinery dealers to receive and make disposition of scrap metal. Farmers, therefore, may take the scrap to machinery dealers, or to scrap dealers.

Green Feed Boosts Egg Production, Experiment Shows

Good winter pasture for laying hens is practically a "must" this year, what with feed shortages and the necessity for most economical egg production—Extension poultry specialists at the U-T College of Agriculture report.

Good pasture will save up to 20 per cent on the feed bill, and it will increase production and hatchability of eggs, experiments show. In one test at the Tennessee Agricultural Experiment Station, pullets fed a ration of mixed whole grains supplemented with laying mash, and with access to crimson clover and rye grass or oats pasture, produced 30 per cent more eggs from October until May than did pullets on the same ration but without green feed.

If winter pasture is not available, the next best thing is bright green alfalfa or lespedeza hay, in either racks or bales, the specialists say. There is no advantage in hens' running out unless they have access to green feed.

Who Will Own the Coal Mines?

Return of the soft coal mines to their owners is again being delayed because John L. Lewis of the United Minc Workers has apparently decided to demand what amounts to virtual control over the industry.

No question of wages is involved. According to the United States News, Mr. Lewis' current demands involve the following:

1. For many years, agreements have contained a clause pledging the unions not to strike during the life of a contract. Mr. Lewis now wishes to eliminate this.

2. Before the war, Mr. Lewis seemed to be glad to sign two-year agreements, and neither party could demand changes until that time elapsed. Mr. Lewis now wishes a quick-reopening clause, which would permit him to reopen negotiations on a month's notice.

3. The heavy demand for coal has made it necessary to operate on a six-day week basis. Mr. Lewis desires a five-day week. In this connection, it is interesting to note that miners receive time-and-one-half for the sixth day, and their weekly paycheck comes to $75.25.

4. The miners' welfare fund every nickel of which is contributed by the operators, was to be administered by a three-man board made up of company and union representatives and a neutral chairman. Mr. Lewis now wants the fund to be controlled by the union alone.

5. Mr. Lewis demands that his union be made the bargaining agent for mine foremen who are the representatives of the mine owners on the job.

If the demands of Mr. Lewis are granted, about the only right the mine owners will have left is that of spending their money in ways the union approves. Have we reached the point where a union head can, with no official opposition, demand the subjugation of a great industry?

Oak Grove Farmer Uses Geese to Chop Berry Patch—They Do the Job!

Dyer, Tenn., Oct. 28—(Special)—W. F. Young of the Oak Grove Community said he uses geese to chop his strawberries and that these choppers cost him about 10 cents per acre per day. He said he would quit strawberries if it were not for his geese. Young finds two geese per acre will eliminate the grass during an average year.

This year Young set out one half acre of new berries and reworked one acre of old berries. He strung a 26 inch woven wire fence around the strawberry patch to keep the geese in. Water is kept in a trough on the outside of the patch so the geese will not waste it. They have to drink by sticking their heads through the woven wire fence. The geese are fed corn to keep them in good condition.

Tom Harris Bradford used geese to chop a two acre cotton field which was heavily infested with nut grass this year.

Use of Fungicide Prevents Mildew in Closed Cottage

How to prevent mildew in a closed vacation cottage is a real problem to everyone fortunate enough to have such a place. A little cabin for week ends, which must be left closed for five days at a time, presents the same problem, too, because it doesn't take long for mildew to grow.

The musty odor and the property damage caused by the presence of mildew can be avoided by the use of a safe fungicide which destroys the mildew and prevents its return for months. It may be applied by spraying, daubing, or dipping, depending on the surface to be treated. Diluted and used in an ordinary spray gun it will protect clothes, curtains, upholstery fabrics, and other home furnishings. Smaller surfaces may be wiped with a saturated cloth.

Carpets and rugs should be sprayed and dried before rolling up or, if they are to be left on the floor, spray the underside, also. Do the same with bedding.

Such precautions will save time and temper in the spring, as well as actual replacements from damage.

Fire Kills More Than War

Since 1920, more Americans have lost their lives by fire than in all the devastating battles of World War II, according to the Chamber of Commerce of the United States. In the last decade, 100,000 victims have been claimed by fire, and 170,000 more have been seriously burned, many of them disfigured for life.

Fire Prevention Week will shortly be observed. During that week and during every other week the American people can effectively prevent fire by following a few simple rules. Ninety per cent of all fires, big and little, are preventable. The National Fire Waste Council offers these suggestions to the homeowner and business man:

Check from cellar to attic for rubbish—and get rid of it. Check heating systems. Keep ashes in metal containers and shield fireplaces with screens. Don't smoke in bed, and keep plenty of ash trays handy. Don't clean your clothes at home with flammable agents. Never bring gasoline into the house for any purpose. Keep matches away from children. Replace frayed electric cords and defective electric appliances.

There's nothing difficult or costly about these rules. And their observance would save this country thousands of lives and hundreds of millions of dollars worth of property every year. The big job of fire prevention simply consists of all of us doing little jobs regularly and conscientiously.

Oil Products for the Farm

New developments in petroleum products are helping the farmer save money by making his equipment last longer and operate more efficiently. That is the gist of talks made by the laboratory staff of one of the major oil companies to a group of farm editors and writers who recently met in Chicago.

During the war the oil industry, working its research laboratories at top efficiency, made rapid progress in developing such valuable products as rust preventives, insecticides and better lubricants for a variety of purposes. These war-born products are now being made available for farmers and other civilian users to employ in the arts of peace.

It is estimated that a modern farm of a few hundred acres requires an investment of about $35,000 in mechanical equipment. Proper maintenance of that machinery is thus one of the most important farm tasks. Every year added to the life of a tractor, a combine, a mower or any other piece of high-priced equipment means more money in the farmer's pocket. And the farmer makes use of a long list of other oil products besides lubricants and fuel. These include paints, weed killers, waxes, polishes, leather preservatives, desiccants, and applications which guard fabrics against mildew.

The oil industry, through its constant scientific progress, is making an increasing contribution to the life of the American people.

Used for raincoats, garment bags, aprons, bibs, shower curtains, caps, and as covering for kitchen dishes, polythene is a new plastic relieved from military duty and now available in sheet form.

Margarine was first developed by a French chemist in 1870 to ease a fat shortage resulting from the Franco-Prussian War.

Arsonists at Large

During the war, certain special troops, such as those serving with the OSS, were given technical instruction in arson. Elaborate textbooks were printed to assist the student in attaining proficiency in destroying enemy ammunition dumps, headquarters and other installations, by fire. These works, of course, were classified "Secret" and were never allowed to fall into the hands of the general public.

However, judging by recent fire loss statistics, the American people need little instruction in how to start destructive fires. Because of our carelessness, ignorance and plain downright laziness, we are experts in the field.

The figures tell the story. Authorities say that nine out of every ten fires are easily preventable. Yet we will burn up about $600,000,000 worth of property this year, to make the worst record in history—and we will burn to death some 11,000 human beings along with it.

This will happen because we insist on being careless with heating equipment; because we permit faulty electric equipment to go unrepaired; because we litter basements and attics and closets with inflammable trash; because we improperly dispose of smoking materials— and because we do a hundred and one similar things that a modicum of common sense should tell us not to do. Think it over—and then decide whether you're willing to do your part to prevent fire.

Forcing Prices Up

The recent decision in a Federal court which held the Great Atlantic and Pacific Tea Company, largest retail food chain in the country, guilty of anti-trust law violations, contains some grim implications for the consumer. The government has filed similar indictments against other chain systems. And if this decision is upheld by the highest courts when appealed, either it will be necessary to revise the anti-trust laws —or to virtually abandon low-cost merchandising in this nation.

The A & P was not accused of gouging the public. To the contrary, the government case was largely based on the fact that the system used profits to reduce retail prices. No strong evidence was presented to prove that it had driven competitors out of business. In fact, the system's proportion of the national food business was sharply less in 1943 than in 1933. And, as everyone knows, in all the towns and cities where A & P operates, independent food stores and other chain systems also operate in direct competition, and get their share of the total business.

The president of A & P has said: "Our company grew to its present size because it believed it was better to sell 200 pounds of butter at 1 cent a pound profit than 100 pounds at 2 cents a pound profit." That is the basic principle underlying the great American doctrine of mass production and mass distribution. And if that is illegal, what part of the American industrial machine will be immune to legal attack and possible destruction?

As a result of this decision, U. S. consumers may find themselves paying more for their food than would otherwise be necessary. It was the intent of Congress, when the anti-trust laws were written, to destroy businesses whose basic principle is to sell at the lowest possible price. If the decision of the Federal court is upheld, Congress should act at once to make necessary changes in the statutes to protect the consumer from laws that penalize efficiency.

"All those who insist on using organized force to advance their selfish interests should be recognized as public enemies in an interdependent society which cannot prosper or even survive except through the ever closer and more willing cooperation of all its members."— Donald R. Richberg, Co-author(Railway Labor Act and National Industrial Recovery Act.

Poetry of Cattle

By Jasper B. Sinclair

It is not surprising that anything so important as cattle in the general scheme of things should have merited a few nods of approval and recognition from the world's poets, songsters and prose writers.

The modern melody, "Till the Cows Come Home," has its counterpart in the 18th Century folk-song, expressed in broad Scots' dialect. "When the Kye Come Hame." The theme is the same in both instances, if you remember that "kye" is merely the dialectic plural of cow.

Even the nursery rhymes of childhood feature the ever popular tale of the cow that jumped over the moon in a rather remarkable display of athletic prowess. And there are the Biblical tales of the fatted calf and the Golden Calf. The latter was cast by Aaron from the earrings of the people, as any student of the Bible will remember.

Almost legendary is the jingle to the effect that "I never saw a purple cow, I never hope to see one." Its author, Burgess, declares that the purple cow is remembered to the exclusion of all that he has written in fifty years at the writing table.

Such pastoral poets as Robert Burns, James Whitcomb Riley and John Greenleaf Whittier have painted many word pictures of cattle in the fields and along the roads that lead to home.

The classic example of this sort of course, is contained in the opening lines of Gary's familiar Elegy: "The curfew tolls the knell of parting day, the lowing herd winds slowly o'er the lea."

Virgil, the celebrated Latin poet, wrote an epic on the care and habits of cattle some 1900 years ago. At that he was merely copying some of the ideas that had been previously expressed by Theocritus, another Latin poet who had written lyrically on the same subject.

Shakespeare makes frequent mention of cattle, but for that matter, you can find almost anything you wish in the Shakespearean library. There was little in town or country that escaped the facile pen and keen imagination of the Bard of Avon.

Crop Production Rise Expected on Record Crops

WASHINGTON, Oct. 14—(AP)—Fall harvests are bearing out the Agriculture Department's early season forecasts that crop production this year will be the largest in history.

In a harvest-season report yesterday, the department said total production of all crops will be 2.5 per cent above the previous record of 1942 and 26.4 per cent above the 1923-32 level.

From the long range standpoint of meat-hungry consumers, the best news in the report is the fact that production of livestock feed grains—topped by a record corn crop—will be four per cent larger than the 1942 peak.

The department said feed grain supplies per animal will be the most liberal in history—a fact that should open the way to sharply expanded output of meat animals, milk, chickens and eggs.

But the full effect of this expansion will not be felt much before next summer, when grain-fattened cattle are expected to move to slaughter in large volume.

The production of food grains—wheat, rye, and rice—likewise is the largest in history. A record wheat crop of 1,169,422,000 bushels compares with the 1935-44 average crop of 843,692,000 bushels.

Other crops being harvested in a record volume include potatoes, tobacco, peaches, pears, plums and truck crops. Those of near-record proportions include oats, rice, peanuts, grapes, cherries, and sugar cane.

Average or better harvests are reported for hay, soybeans, dry peas, prunes, apricots, hops, sugar beets, flaxseed, sorghum, grain, buckwheat, sweet potatoes, and apples.

Only in the case of cotton, rye, broomcorn, dry beans and pecans are below-average crops being produced.

Blind Farmer Operates Dairy

There are many stories about how various people who are laboring under one kind of physical handicap or another manage to make a living for themselves and their family—but one seldom hears a story more unusual than that of Dennis W. Taylor of Bedford County, who is totally blind, yet he is a successful farmer.

Taylor is 34 years old and has been without sight since he was 10. He is married and is the father of a 6-month-old baby boy. His major source of income is from 17 Jersey cows he milks alone on the farm, which was bought and paid for through his farm earnings.

Taylor lost his eyes only a few months before his eleventh birthday while attempting to "blow up" some rock on his mother's farm. "I placed the dynamite under the rock and lighted the fuse and ran, but after some time there was no explosion, so I went back to investigate the trouble. Then just as I stooped over the explosion came, and that was the last I remembered for some time," he continued. Taylor said his condition was poor for several weeks, but within six months after the accident he was back in school—the school for the blind at Nashville, for he was totally blind.

He spent almost 10 years there, and completed high school as top man in his class. He said he returned home to his mother's farm, no future plans in mind. His mother owned three cows, and with some money that had been saved he purchased two other cows—one for $18 and the other for $22.

He continued to live with his mother and milked the cows for half of the income from the milk that was sold. Milk at that time was selling at a price far below today's mark, and the process of saying was slow, but Taylor managed to save some money.

It was almost two years later, after he had purchased a few more milch cows, that he married a girl in his home county. After a few years of married life Taylor decided that he wanted to apply the money he had saved to a home and farm of his own. The farm he desired to buy was located only a short distance from his mother's home. However, there was one limiting factor—he lacked about $500 having enough money to pay for the farm. "It wasn't an easy matter to get some one to loan me the money, because they couldn't believe I would be able to repay it," Taylor said. After many attempts, the money was borrowed and the farm purchased.

The number of cows in Taylor's dairy varies from time to time, but has been on a continuous climb since he first started. The total is now 17, most of which will be in milk during the winter months.

Taylor has no farm help. He does all the milking, caring for the cows, feeding, cleaning and washing milk utensils. He hires no help except for jobs that one man eannot do, such as hay hauling, planting and harvesting his field crops. Most of this help is secured by swapping work with his brother, who lives at the "old home place."

Taylor's annual income is about $3,000 or at least has been for the past few years. However, he was quick to remind that only about one-third of that amount was net. He produces the family's supply of pork. In his pig pen presently are two porkers that will weigh almost 200 pounds each, and they will be slaughtered the first cold spell. Also contributing to the family food supply and to the family income are 150 hens most of which are young pullets that will start laying within the next few weeks.

One of the most unbelievable tasks accomplished by Taylor is driving the cows to and from the pasture, which is located some distance from the house—and in order to get them there they have to be driven some distance down the road and through a gate. He not only drives them to the pasture, but goes to the pasture for them in the afternoon. He can locate the cows and tell when he has them all out, "just by listening."

Outside Wiring on Farm Important; Should Be Durable, Safe, Adequate

By Kenneth B. McPherson

It is nearly always desirable or even necessary on every farm to do a certain amount of outside wiring. This may include a secondary service extension to some point on the farmstead such as a barn, poultry house, or other building. Frequently a yard light is installed or an electrie hotbed is made at some considerable distance from the end of the power company service, or the electric pump must be served at a distance of several hundred feet away from the house.

All of this wiring and extension of service is done by the farmer and includes poles, wires, insulators and a certain amount of construction that should be done in such a manner that it will be durable, safe and adequate.

It is normally not desirable to space poles more than 150 feet apart when annealed eopper wire is used. When excessively long spacing is used there is a tendency for the wire to lengthen and sag, due to its own weight and temperature changes. After a time the wire has to be either restretched or additional poles added.

In figuring the pole height for a job, allowance must be made for several factors:

(1) Amount of ground clearance needed under the wire; (2) probable amount of wire sag; (3) amount of space necessary on top of pole for mounting wires; and (4) depth of pole in ground.

For example, if a farmer installs a 20-foot pole in his barn lot, three and one half feet are allowed to go in the ground. The wires mounted on the side of the pole take up another foot, and two and one half feet are allowed for wire sag. That would leave only 13 feet clearance from the ground, which might be sufficient for some barn lots but for many it would not, particularly if a high load of hay were to pass under.

Frequently it is necessary to pass wires over a public road. In such cases a minimum ground clearance of 18 to 20 feet is necessary.

In estimating pole depth in the ground one should figure on a minimum of 3 feet for a 15-foot to a six feet for a 34 foot pole.

Poles should never be eliminated by attaching wires to limbs of trees.

When the pole must take strain due to the wires approaching at one angle and leaving it at another, some support must be given it so the top will not pull over. The strongest and most substantial support is a guy wire extending from well toward the top of the pole down into the ground and fastened to a steel or stone "dead man." Do not depend on a tree or fence post to anchor the guy.

The top of the pole should be drawn baek when the support is installed, until it leans slightly away from the direction in which the wires will pull.

Make Hay Without Sunshine

Barn Curing of Hay Removes the Hazard of Weather and Aids in Vitamin Content

Receiving the widest acclaim throughout many sections of the country is the comparatively new mow, or barn, curing of hay. There is every indication that it will revolutionize hay curing in this country, since it removes the one main hazard in any hay operation—the weather.

One of the barn hay drier or finisher methods was developed by the University of Tennessee and the Tennessee and the Tennessee Valley Authority a little over five years ago. It is known as the Tennessee system and has a long tapered duct down the eenter of the barn with lateral ducts on each side. Since that time many new modifications have been made in developing this system of saving hay by many individuals and firms.

Another is the Ohio system which has a large cross section straight main duet on one side of the barn with lateral ducts leading across the floor. A fan may be used in either end of the tunnel or duct, with the Ohio system, thus reducing the size of duct required.

In addition to practically eliminating the loss of hay from the weather, barn curing makes possible the saving of most of the plant leaves, which contain a high percentage of the protein and carotene, source of Vitamin A. in the hay. Furthermore, the barn drier system can be adapted to most any size and type of barn and, if it is properly operated, will do much to avoid spontaneous hay combustion.

The barn hay drier consists of a wooden duet system (experimental work is now being done with clay tile and steel pipe) designed to fit the barn, a fan large enough to supply the required amount of air into the duet system and an electric motor and control unit for the fan.

The Tennessee duct system is made up of a main duct which runs through the barn and lateral ducts built on both sides to carry air throughout the barn. Usually these lateral ducts are much smaller and carry air under low pressure. Ample openings are left in these laterals to allow free passage of air throughout the hay continuously until hay is completely cured.

Hay is cut in the field the regular way and allowed to cure for a short time, but not long enough for the leaves to begin to shatter. It is then hauled to the barn and evenly distributed over the air ducts. In some of the systems now in use the hay is chopped and then carried to the barn.

While most agricultural engineers advise getting the moisture content lower, hay containing as much as 60 per cent moisture has been suceessfully handled with the barn drier. In long hay, 40 per cent moisture is not too high with most systems.

The amount of time required for finishing the curing of hay in the barn varies with the moisture content, the amount of air which is forced through it and the depth of the hay in the barn. E. T. Swink associate agricultural engineer of the Virginia Polytechnic Institute, writing in the Southern Planter, reports that most Virginia farmers cure an average cutting of hay in ten to fourteen days under normal conditions. While he points out that most systems in Virginia are designed for loose long hay, with some of the driers it is possible to cure hay in the bale form and also to cure chopped hay.

A survey was made in Virginia of farmers who used barn driers last year and 100 per cent of them reported they made better hay than by the old method; 96 pereent saved some hay they would not have otherwise been able to save; 84 percent observed better results from feeding barn-cured hay, than from field cured hay and all of them considered their hay driers a good investment, according to Mr Swink.

At a barn hay-curing conference at Purdue University in January, sponsored by the American Society of Agricultural Engineers. H. A MacDonald, assistant professor of agronomy at Cornell University, reported that in thirty hours of normal field exposure, hay loses up to 65 per eent of its carotene from sunlight. If it rains, the losses from leaching are 67 per cent of the minerals. 35 per cent of the carbohydrates and 18 per cent of the proteins. Hay with moisture content no higher than 40 per cent was recommended as best for barn driers.

There is much interest in this new method of curing hay and many possibilities of the system are still being tested. One fact which seems to be evident is that each barn drier must be considered as an individual one with motor fan and duct system developed on the basis of the particular barn and the amount of hay to be cured. Agricultural engineers at most of the state agricultural colleges and county agents will be able to assist farmers in planning a barn hay drier unit to suit specific needs.

Avoiding Pitfalls for Veterans

In an address before the American Retail Federation, Commander Ralph A. Sentman, National Director of Veteran's Affairs, stressed the importance of retailer—veteran activities whereby experienced merchants eounsel returned soldiers in the conduct of retail business.

A sample survey made some time ago indicated that more than 500,000 veterans planned to establish their own businesses. A very large percentage of these, of course, were interested in retail trade in one field or another. In a normal year, two out of three new enterprises fail and only one out of five live more than ten years. As Commander Sentman said, "Should these ratios hold true in this large group of veterans establishing new businesses, most certainly the economic reaction to such identified failures would be tragic."

Many and perhaps most of the veterans who wish to establish retail stores are without adequate experience. They know relatively little of the pitfalls that lie ahead. Retailer—veteran conferences are designed to open the prospective store operator's eyes to the problems that he must face.

Commander Sentman offers the opinion that these activities should be extended whenever possible For the most part, the work has been under the leadership of the chain store systems of the country, and their participation has been enthusiastic and sustained. It is essential that the job be continued, and that all merchants contribute to it in some measure. It is the starting point for men who will serve the consumers of this country in the decades to come.

Barn Hay Driers Popular with Farmers

Barn hay driers developed and proved in a point project of the TVA and the University of Tennessee, are becoming increasingly popular aecording to a survey conducted by the U. S. Department of Agriculture among 50 farmers using the barn hay driers.

Eaeh of the 50 farmers declared he had better quality hay by barn curing. Three out of every four said they had observed better results from feeding barn cured rather than field cured hay. The others said they had no comment, or had not had an opportunity to observe the results of feeding the hay. Ninety-seven and one half per cent of the farmers questioned said that use of the barn hay drier had enabled them to make better use of labor on the farm.

The 50 farmers were also unanimous in saying they considered the barn hay drier system a good investment. And all answered "yes" to the question of whether they would recommend the barn curing method to other farmers.

Currently, there are 122 barn hay driers in operation in Tennessee. The increased income, through better quality hay, and greater, amounts that can be handled, has made this a profitable development for Tennessee farmers, M. M. Johns, Extension rural electrification specialist, U.T College of Agriculture, said today. Scareity of materials has kept installation of driers at a minimum; but the out look for materials now is greatly improved, especially for motors, Johns deelared.

Rather than a dog, I would choose a cat. It has for me the manners essential to social relations. At first, in its early youth, it possesses all the graces, suppleness, unexpectedness by which the most exacting, artistic fancy can be amused! It is adroit, it always knows where it is. Prudent unto caution, it goes everywhere, it examines without soiling, breaking nothing; it is in itself a warmth and a caress; it has not a snout, but a mouth—and what a mouth! It is discreet and of fastidious cleanliness—it cannot be enslaved. It is a dignified, proud, disdainful animal that hides its love affairs in the shadows. It defies advances, tolerates no insults, abandons the house in which it is not treated according to its merits. In short, it is truly an aristocrat in type and origin. —**Alexandre Dumas**

Pressure Group Government

The railroad eompanies, which are having to pay the millions in increased wage and material costs, are still awaiting a decision for an increase in freight rates. They do not threaten to stop running the trains if increases are not granted by a certain date, even though failure to get increases might mean utilmate bankrupcy.

This tendency to prolong all forms of official inquiry where it affects industry is one of the things that is retarding sound reconversion of industry. Already the nation has given up thinking of 1946 as a year of progress after the war. We are now talking about 1947 as the year when we can start going ahead—but no one knows.

The railroads are an example of what every business is going thru. Each one is waiting, waiting, waiting, because some one else thinks they know more about how it should be run than those responsible for its success.

Government today has become so big, and has so many departments that no one dares make a decision without the lapse of an interminable length of time and the shifting of decisions to some one else, thereby eliminating personal responsibility.

Big government is probably the greatest deterrent to normal economic recovery. It owes to the dictatorship of pressure groups but it neglects to promptly settle the most pressing problems of the ordinary industry or citizen who cannot bring vote pressure to bear.

Why shouldn't rate or price increase which are forced by wage increases become effective simultaneously with the advance in wage rates?

Why Not Be Sensible?

Not that the "annual" bituminous coal strike is over and the nation has suffered its usual loss and inconvenience therefrom, it might be good polities to prepare sound and equitable legislation that applies equally to employer and unions.

Our labor laws do not prevent strikes or provide for a settlement between industry and labor. Their application has had just the oppo site effect—they induce strikes and leave the settlement to government. The operators must accept the terms made by the government. Would labor like this process if it happened to work the other way?

If private enterprise is eliminated by continued government seizure of private property as a means of negotiating wage settlements, it will only be a question of time untill government is the actual owner and operator of our basic industries. Then labor will find itself in the position of industry today. Government will be the dominating factor, for it is more powerful than labor. Labor will do what government says as has been proved in countries where private enterprise is non-existent.

Therefore, if labor wishes to save its independence it must work with industry to save the independence of both. That can be done by the adoption of methods which put equal responsibility on labor and management for the settlement of their controversies, before the public has been so injured it is willing to see drastic legislative action to maintain production even at the expanse of the freedom of both industry and labor.

WOMAN'S PAGE

Use Honey or Sugar to Sweeten Rhubarb

By Alice Bennett

Grocers complain that the rhubarb now on the market isn't selling to homemakers—and any good eook will retort that it's because of the sugar supply (or lack of it).

It's true that rhubarb does require more sweetening than most fruits, but it's also true that it has sufficient flavor to permit the use of substitute sweetenings.

Honey or corn syrup—the latter less expensive—can be used to get full value from this mid-winter economy buy.

In these reeipes, you'll have a chance to experiment with the flavor—hope you'll like it!

BASIC RHUBARB SAUCE

2 pounds raw rhubarb
1 cup extra-sweet corn syrup
1-2 cup water.

Wash and cut rhubarb into one-inch pieces without removing the skin. Drop into a syrup made by mixing corn syrup and water. Boil until tender. This mixture may be canned if desired, and is excellent for pies, tarts and sauce.

RHUBARB SHORTCAKE

2 cups sifted flour
4 teaspoons baking powder
1-2 teaspoon salt
5 tablespoons shortening
2-3 cup milk
2 1-2 cups rhubarb sauce.

Sift flour with baking powder and salt. Cut shortening into flour mixture. Add milk and mix quickly. The dough should be soft.

Turn onto floured board. Knead about one half minute. Roll to 2 3-8 inch thickness. Cut and place on a baking sheet. Bake in a hot oven (450 degrees F.) until brown, about 12 minutes. Split the biscuits and fill and top with rhubarb sauce. Serves eight.

RHUBARB BREAD PUDDING

2 cups diced rhubarb
1-2 cup light corn syrup
2 cups bread erumbs
1 tablespoon grated lemon rind
1 1-2 tablespoons lemon juice
1 cup milk
1 egg

Wash, peel and dice the rhubarb. Add eorn syrup, bread crumbs. lemon rind and lemon juice and mix well. Beat the milk and egg together. Add to rhubarb.

Place the pudding mixture in a greased baking dish. Dot the top with butter or margarine and bake in moderate oven 30 minutes or until firm.

BAKED CUCUMBERS WITH TOMATO SAUCE

2 very long cucumbers
2 cups cooked fish, meat, or poultry
2 slices, day-old bread, cubed
1-2 cup evaporated milk
1 egg
2 tablespoons chopped green pepper
1 small onion, finely chopped
Few grains pepper

Peel cucumbers and cut each into 3 pieces. Hollow out the centers by removing seeds and soft pulp. Soak cucumbers in salted water while preparing stuffing. Soak bread in milk until almost all liquid is absorbed. Combine with cubed or minced fish, meat or poultry. Add egg, green pepper, onion and pepper, and salt if desired. Stuffed drained cucumbers with this mixture. Place in casserole and add enough water to prevent scorching. Cover and bake in a moderate over (350 degrees) until tender, about 1 hour. Yield: 6 serving pieces.

Tomato Sauce

1 tablespoon fat
1 tablespoon flour
1-4 teaspoon salt
1-3 cup boiling water
1-3 cup evaporated milk
1 1-3 eups tomato (fresh or canned), pressed through a strainer

Melt fat. Stir in flour and salt. Add water slowly, stirring constantly to keep smooth. Add milk and cook slowly, stirring, constantly, until mixture is thickened. When ready to serve, add tomatoes which have been heated. Serve over baked cucumbers.

Dark baking pans help cakes cookies or pies to brown.

TANGY BEETS

You will like the different flavor that mustard-margarine s a u c e gives to beets. Combine 2 teaspoons of prepared mustard and 1-4 cup of margarine and serve over cooked beets—or other vegetables for that matter.

LIKE FISH? TRY THIS

6 trout (or fillets of any fish)
6 thin slices salt pork (or 1-4 cup bacon fat)
2 cans Party Peas
1 tablesp. butter or margarine
1-4 teasp. salt
Lemon wedges

Clean and wash fish. Notch edges of salt pork and fry until crisp. Remove. Cook trout or fillets slowly in hot fat, turning until lightly browned. Lay on platter. Also heat 2 cans of new pack peas, so young and tender, so flavory that they actually enhance the delicate flavor of your favorite fresh-caught or fresh-bought fish. Drain peas. Add butter, salt. Then surround the fish with a bright green border of luscious Party Peas and sit down to discover how really delicious fish can be.

STIFFER WHITES

Both acid and salt help beaten egg white hold their stiffness. A pinch of salt or cream of tartar added at the start of whipping will give the foam greater volume and stability. On the other hand, even a small particle of fat in the white will prevent it from beating stiff. No bits of yolk should be left in the white because yolk contains fat. The beater should be free of any traces of oil.

BAKED GLAZED PARSNIPS

In a well-greased shallow baking dish place 3 cups cooked sliced parsnips. Cream together 2 tablespoons butter or margarine and 1 teaspoon dry mustard; dot over parsnips. Pour 1-3 cup corn syrup over parsnips and bake in hot oven (400 degrees) 20 minutes. Serves 4-6.

Conservation Tricks

To get the last bit of shortening out of can or jar, fill with very hot water. Shortening's easily removed when water cools.

To freshen stale cake or rolls, wrap in a towel, place in warm, not hot, oven a few minutes before serving.

To keep egg yolks for several days, cover with cold water, store in refrigerator. This will prevent their drying out.

To keep flour in perfect condition, turn it out of the sack into a eontainer and keep tightly covered in a cool place.

To store crumbs Place crumbs in jar; cover with cloth; secure with rubber band rather than lid. This prevents molding.

To make crumbs Place dry bread on half of towel; fold other half of towel over. Roll with rolling pin till crumbs are fine.

To prevent bread from molding Remove paper wrapper, keep loaf on rack in well ventilated bread box

Use those stale leftover bread slices for a luncheon dish. Toast slices; place on platter; cover with tangy cheese sauce.

Use leftover bread crumbs to thicken the hot liquids you use for gravies and sauces. To make horseradish sauce: moisten I cup crumbs with 1-2 cup hot milk; add 1-4 cup grated horseradish, 1 tbsp. lemon juice, 1-2 tsp salt, dash cayenne. This is nice with boiled beef or fried fish.

SIMPLE DEVICE PREVENTS FOOD WASTE

There is a solution to the problem of keeping the zip and tangy sparkle in carbonated beverages once they are uncapped. It is a new cover made of moistureproof cellophane and an aluminum board collar that fits snugly over the top of the bottle and holds the cellophane in place. To cap a bottle, simply spread a sheet of cellophane over the top and press the collar down around the sides to lock it in place. These handy tops are also made for jelly glasses (no paraffin necessary) and keeping ketchup and fruit juices, too.

Every year, more than 3,500 lives are lost in farm fires alone.

SCALLOPED CABBAGS

Make a white sauce by melting 3 tablespoons drippings or other fat, adding 3 tablespoons flour, 1-2 teaspoon salt and blending well. Slowly add 1 cup milk and cook until thickened, stirring to prevent lumping. Cook 1 quart shredded cabbage in boiling water for 3 minutes. Drain, Place in casserole. Add white sauce and sprinkle top with 1-4 cup bread crumbs. Bake for 20 minutes in a 375-degree oven. If brown top is desired, put a little bacon drippings over the crumbs. Serves 4 or 5.

GLAZED LUNCHEON MEAT

12-ounce can luncheon meat
Whole cloves
1 teaspoon fine dry bread crumbs
1 tablespoon molasses
1 teaspoon prepared mustard
1 tablespoon fruit juice
1-4 eup hot water.

Leave meat whole as it comes from can; place in a baking pan. Score top about 1-4 inch deep. Stud with cloves. Sprinkle top with bread crumbs. Combine remaining ingredients, except water, and pour over top of meat. Pour the water in pan around the meat. Bake 35 minutes in moderate oven (350 degrees). Baste four times during the baking. Serves 4.

IMPROVED FLAVOR

A small cube of cheese added to the center cavity of a baked pear a few minutes before taking from the oven, will improve the flavor.

TOMATOES WITH HERBS

Peel 6 large tomatoes and cut in fairly thick slices. Mix 1-3 teaspoon basil, 1-2 teaspoon celery salt, 1-4 teaspoon thyme, 1-4 teaspoon sugar, and as mueh black pepper as desired. Sprinkle the mixture over each slice. Place in deep plate and let stand in the refrigerator for 2 hours. Serve very cold with a sprinkle of tarragon vinegar.

TRY THESE SPAMBURGERS

Have you a hit parade of taste-tempting entertainment d i s h e s? Then add this recipe to the list . . . for there's nothing finer for football parties, for Saturday night gatherings, for the Small Fry parties! It's a SPAMburger!

A slice or two of SPAM on one half of a buttered bun, cheese on the other. Put under the broiler until the SPAM is golden brown, the cheese bubbling hot! Garnish with dills, olives, mustard or mayonnaise.

No frills needed in preparation, no special care . . . because the pure tasty pork shoulder and tender sweet ham meat in SPAM is both appetite-satisfying and taste-tempting! SPAM is sold only in 12-oz. tins . . . is made exclusively by the Hormel Co., Austin, Minn.

ICE BOX COOKIES

Cream 1 1-2 cups of sugar, 1 cup of butter and one egg. Beat well. Add second egg and beat. Sift 1 1-2 cups of brown sugar, 3 1-2 cups of Roy Acuff Flour. 1 level teaspoon cream of tartar. 1 level teaspoon soda and pinch of soda. Add to mixture with vanilla. Make into rolls. Put into icebox for 12 hours. Slice off in thin cookies and bake.

Household Hints

TARNISH PREVENTIVE

A boon to housewives is a soft flannel cloth which will prevent tarnish for as long as silver is left in its folds. The composition of this novel cloth includes tiny partieles of silver which attract the tarnishing elements in the air to it, and thus protect the silver it embraces.

To save crumbs from scattering roll dried bread or cracker crumbs in a paper sack using a regular rolling pin.

A little garlic or garlie salt added to boiled rice to be served with creole chicken gives a new flavor combination.

The pilot light on tne gas stove may be put to good use in keeping salt dry in damp weather. Set the salt container near it before going to bed at night to dry it out for use next day. Or after using the oven, set the salt in to dry out in the warmth that remains after the oven is turned off.

SALVAGED FATS ADD TO SUPPLY OF SOAP

While the supply of soap is not all that the housewife could wish, she can grease the way for more adequate supplies by continuing and increasing the salvage of used fats and oils specialists of the Extension Service who are cooperating in the salvage drive, said this week.

REFRESH WEARY FEET

After a tiresome day of shopping try soaking your feet in warm salt water, drying them thoroughly with an absorbent towel and then massaging them briskly with a good ice-cold cologne. Knead the soles well and rub vigorously to start better circulation. Then dust liberally with bath powder and prop your feet high on pillows. A simple little treatment like this will work wonders on those tired pedal extremities.

BARBECUE

When I am really hungry and . . . I have a pennies few . . . I like to treat my stomach to . . . A tasty barbecue . . . A sandwich filled with beef or ham . . . Or chicken soft and brown . . . Fresh pie and then some coffee or . . . Some milk to wash it down . . . It seems to add a zest to life . . . And makes me feel more fit . . . Particularly if the meat . . . Is roasted in a pit . . . Some people crave fillet mignon . . . Or oysters on the shell . . . But I prefer the barbecue . . . With its delicious smell . . . And while I do not claim to be . . . A connoisseur of food . . . I recommend the sandwich that . . . Is richly barbecued.

MIDSUMMER MAGIC

Melba Ice Cream Sauce

Combine 1-2 cup currant jelly, 1 cup crushed fresh raspberries and juice, and bring to the boiling point. Mix 1 teaspoon cornstarch with 1-2 cup sugar and stir into the boiling mixture. Cook over medium heat, stirring constantly, until mixture is thick and clear. Strain and cool. Add 1-2 teaspoon Burnett's Imitation Raspberry Flavor. Serve over vanilla or peach ice cream. Serves 6.

Burnett's lends the magic touch To the sauce you'll like so much!

Thin slices of orange, with rind left on, topped with a cube or teaspoonful of jelly, are attractive either on a meat platter or individual plates. Use mint jelly with lamb chops,- crabapple or currant jelly with ham, canned cranberry sauce with beef.

BIT OF MEAT ADDS TASTE APPEAL TO VEGETABLE MEAL

A clever homemaker will try to include at least a small amount of meat, even when the meal features garden vegetables. She can do this in many ways; the following ideas are just a few suggestions:

Add meat to the stuffing of deviled eggs, to serve with hot vegetables or a vegetable salad. Use chopped crisp bacon, liver sausage dried beef, or cooked pork sausage.

Serve potato chips, crackers or dry melba toast with a meat spread.

Add small pieces of cooked or ready-to-serve meat to bowls of hot vegetable soup.

Add a little ground cooked meat to left-over gravy, and serve on top of mashed potatoes.

Serve one of the vegetables in an egg souffle, and add a small amount of finely chopped meat for extra flavor.

Add chopped cooked bacon or thin frankfurter slices to potato salad or a vegetable salad.

Add small cubes of ready-to-serve meat to the stuffing for a baked vegetable.

Add deviled ham when making a cream sauce or cheese sauce to serve over a vegetable.

Serve stalks of celery stuffed with soft yellow cheese, with chopped bacon added.

BRIGHT SALADS

Remember when making any pear salad, that fresh peeled pears, like apples and bananas, need a sprinkling of lemon juice to prevent discoloration, Grapefruit or orange juice will work equally well if you're short on lemons.

HEARTY EGG SALAD

1 envelope unflavored gelatin
juice
1-4 cup cold water or vegetable
6 hard-cooked eggs, diced
1-4 cup stuffed olives, sliced or cucumber diced
1-2 cup green pepper, diced
1 cup cooked rice or macaroni
1-3 cup mayonnaise
2-3 cup sour cream
1 tablespoon prepared mustard
3-4 teaspoon salt

Soften gelatin in cold water or vegetable juice, dissolve over hot water. Cool at room temperature. Combine eggs, celery, olives, green pepper and rice or macaroni. Mix together mayonnaise and sour cream. Add lemon juice, mustard, salt and cooled, dissolved gelatin. For an egg and olive garnish on molded egg salad, arrange alternate slices of hard-cooked egg and large olives round the sides of a mold which has been rinsed in cold water. Pour a small amount of the mayonnaise-gelatin mixture in the bottom to hold slices in place, and chill until firm. Combine mayonnaise mixture and egg mixture, using two forks. Fill mold with salad, being careful not to dislodge slices of egg and olive. Chill two or three hours, until firm. Unmold on a bed of watercress, shredded spinach or escarole Garnish with tomato slices, if desired.

SPICY PEACH SHORT CAKE

Gingerbread peach shortcake is an easily prepared family treat, if there is a box of gingerbread mix on the pantry shelf. Just add water, mix, and bake according to directions on the package. Split squares and arrange shortcake, using fresh, frozen, or canned peaches. Top with a generous spoon of ice cream or whipped cream.

CORN CREOLE

2 tablespoons butter or margarine
3 cups peeled and cut tomatoes
1 1-2 cups uncooked corn
1-4 cup chopped parsley
1 1-2 teaspoons salt
1 teaspoon sugar
1-4 teaspoon pepper
1 bay leaf
1 1-2 cups sliced okra

Melt shortening in saucepan, add tomatoes and simmer for 5 minutes. Add corn, parsley, seasonings. Cover and cook for 10 minutes; then add okra and cook 3 minutes longer, or until tender.

THE MODERN FARMER

VOL. XIX. NASHVILLE, TENN., DECEMBER 16, 1946 No. 11

THE BYRD NEST

By Rev. Bernard O. Byrd
—Guest Columnist.

The Wind Blows Good

In the first chapter of the prophecy of Ezekiel, the author of that book tells of seeing in a vision from God, a wind; or at least things which resulted from the wind. Generally winds which cause special notice or special mention are destructive, and are sometimes spoken of as ill winds. The wind referred to by the prophet was more mystifying than terrifying.

The word "WIND" may refer to several things, namely: a movement of atmospheric nature, a confusion among groups of people, a mental disturbance, the entrance of a new school of thought, a change of certain types of government, and a religious movement. However these are but a few of the many things to which wind, storm, or hurricane may refer. In almost every man's life some winds have blown and possibly some more are to blow. We cannot stop the winds, but profiting by our past experiences. we can prepare for their coming.

Without a doubt, the writer ventures to say that possibly some reader of this article will be dubious of a strong wind blowing good, but despite any such feeling, even a high wind often blows good. Should we speak in terms of mother nature persons familiar with rural sections know that a tree is helped when a high storm blows away its dead twigs and rotten limbs. It is understood that limbs which have sap, have a better hold on the body of the tree and therefore cannot be easily moved. Even in our church life, we find storms helpful, despite the fact that no Christian welcomes them. There are usually a lot of dead members in the church organization; that is the visible organization, and we know also that in a storm these members having not the spirit which is required to hold on in the time of a storm, will in all probabilities be blown away. When the storm has settled, generally the spirit filled members are hanging on and rejoicing in God despite the confusion.

Out of the wind spoken of by Ezekiel, came a cloud which presented two mysteries; a fire folding itself inward, and a creature which appeared as four creatures exactly synonymous. The mysterious creatures being four, seemed to represent the coming of the Saviour who in the flesh can be looked upon as one person yet with four personages. By Jesus' own testimony of himself we learn that he in the flesh was God the Father, God the Son, and God the Holy Spirit, and also the Man Jesus. Each creature had four faces, each of which represented certain definite characters of the Christ and of his followers; which characters will be mentioned in a later article. The fact that the creature had calves feet demonstrated that it had the ability to tread upon any soil, that is on the territory of any unbeliever or false believer, yet four creatures moved together, thus without injury to the feet. The revealing that the man who has

Profitable Curb Market Established Near Memphis By 4-H Youth

Wake Negro 4-H Club Heard Josephus Daniels

Negro 4-H Club members, farmers and their wives and county school teachers gathered in large numbers in Greenleaf Chapel, Shaw University, Wednesday, October 30, in observance of Wake County's Annual 4-H Club Achievement Day program. The program got underway at 10:30 a. m., with W. C. Davenport of the State College Extension Service presiding.

From all sections of Wake County 4-H Club members were on hand to participate in the program, report on achievements in their local clubs and receive awards and cash prizes as county 4-H Club champions.

The Honorable Josephus Daniels, former U. S. Secretary of Navy and later U. S. Ambassador to Mexico, delivered an address to the group after being introduced by John W. Goodman, Assistant Director of the North Carolina State College Extension Service.

Mr. Daniels advised the group, "We have separated our head and hands too much, and that is why I appreciate the 4-H Club program because it teaches us to train our heads and use our hands." All of this adds up to helping us to become good neighbors."

Others taking part on the program were James R. Adams, Jr., of the Juniper Level 4-H Club and president of the Wake County 4-H Club County Council; Edward Pretty and Calvin Dozier of the Fletchers Grove 4-H Club; Geraldine Thorpe and Shirley Terry of the Apex 4-H Club; Rev. James Nimmo, Jr., and Dean Foster P. Payne of Shaw University; W. C. Cooper, 4-H Club Specialist and A. E. Brown, District Manager of the North Carolina Mutual Life Insurance Company.

Those making remarks on the program were Frank V. Duffy, Wake County Soil Conservation Worker; Miss Stephens of the Riley Hill School was in charge of music with Nellie Stewart of the Apex 4-H Club as song leader.

Awards and Cash Prizes.

Sweet Potato: Charles Holland, Holly Springs; Lonnie Adams, Juniper Level; Hubert Coffee, Eagle Rock; and, James Montaque, Riley Hill. **Pig:** Walter Hudson Jones, Apex; Willie Lee, Riley Hill; and Curley Leathers, Fletchers Grove.

4-H Club Market Does $3,000 Volume

This year-old 4-H Club roadside curb market in Shelby County, near Memphis, Tenn., did a $3,000 volume of business during the last 12 months. Clarence Harris, 4-H Club youth who owns the market, is busy at right putting tomatoes into a bag for a customer. Pictured left to right are: W. H. Williamson, assistant state supervisor of Extension work; Eddie Harris, Clarence's father; Willie, the owner's brother and chief assistant; R. H. Brown, county agent; Clarence Kneeling, and John W. Mitchell, Extension Service field agent.

Over Third of South's Farms Electrified Through REA Aid

Washington, D. C. More than one-third of the South's 2,900,000 farms which include 670,000 farms operated by colored farmers—are now electrified, reports the Rural Electrification Administration of the U. S. Department of Agriculture.

For the nation as a whole, REA estimates that 52.9 percent, or over half, of the farms now have central stations electric service. Administrator Claude R. Wickard says that 11 years ago when REA was established, only 743,000, or 10.9 percent of the farms in the country were electrified by centeral station service. He says that REA is responsible for about half the increase in rural electrification since 1935.

A total of $82,000,000 has been earmarked for loans in the Southern States during the current fiscal year, on the basis of need as indicated by the number of unelectrified farms in these States as compared with the national precentage of unelectrified farms. The amount allotted to the South represents 65.6 percent of the $125,000,000 to be allotted on the basis of need as requir-

Lawrence Washington Transferred to Farmers Home Administration

Lawrence J. Washington, colored farm credit specialist of the Farm Credit Administration, was transferred recently to the Farmers Home Administration to assist with the making and servicing of farm ownership loans to colored farmers.

Mr. Washington has had wide experience in the field of agriculture. Following his graduation from Southern University, he was for two years a vocational agriculture teacher, nine years a county agent, and since 1942 has been associated with Farm Credit Administration as

Negro Farmers Order 69,000 Pine Seedlings

A colored conservation planner of Aiken County, S. C., has reported to Soil Conservation Service of the U. S. Department of Agriculture that 24 colored conservation cooperators in his county have placed orders with the State Commission of Forestry for 69,000 pine seedlings to be used in carrying out their soil and water conservation plans this year.

Shelby County Future Farmer Creates Thriving Business

WASHINGTON, D. C.—Clarence Harris, 4-H Club youth of Shelby County, Tenn., is doing a $3,000 a year business with his roadside curb market near Memphis, says a report received by the U. S. Department of Agriculture from the Tennessee State Extension Service.

Clarence got the idea for establishing a curb market from his county agent, R. H. Brown, who has been carrying out extension work in the county for nearly 28 years. Observing the heavy traffic of workers who passed Clarence's home every day going to and from work, Mr. Brown suggested that Clarence might sell them some of the vegetables out of his club garden and fruit from the family's pear, apple and peach trees.

So, one day in June of last year, Clarence and his brother, Willie, dragged a crudely built table into their front yard near the highway, and placed on it a few heads of cabbage, a basket of tomatoes, and three dozen ears of corn. Within a couple of hours they had sold out, and Clarence was sold on the idea of a curb market.

That evening he went to see a carpenter about building a real curb market for him. The carpenter wrote down on a piece of paper and then said, "Well, the kind of market you want will cost about $135, unless you can find some cheap used lumber."

Clarence jangled the $11.45 he had in his pocket and thought about that $25 war bond he had tucked away at home. Altogether, he could not raise more than $30 and the carpenter said it would cost $135, unless he could find some used lumber.

There was a little used lumber around the house. His father had remodeled their home a few months before. He collected all the used

2nd Annual 4-H Boys, and Girls, Achievement Day of Davidson County

Meeting Held At A. And I. State College Nov. 23, 1946

The Second Annual 4-H Boys' and Girls' Achievement Day of Davidson County was held at A. and I. State College on November 23rd from 10:30 a. m., to 3:00 o'clock, with William Robertson, a 4-H Boy from Antioch School, presiding. The program for the meeting was as follows:

10:30-10:35, song, "America," led by Mrs. Clara Brown, teacher Bordeau School.

10:35-10:40, invocation, Novella Hutchinson, Pres., Dry Creek, 4-H Club.

10:40-10:45, welcome address, Dr. W. S. Davis, President A. and I. State College.

10:45-10:50. response, Virginia Patton.

10:50-10:55, Pledge to the Flag, Older 4-H Club Girls, Haynes County High School.

10:55-11:00, Club Pledge, 4-H Club members.

11:00-11:05, America the Beautiful, led by Mrs. Clara Brown, teacher Bordeaux School.

11:05-11:45, address, Honorable Judge Litton Hickman, County Judge of Davidson County.

11:45-12:00, 3-minute remarks:

Miss Helen Cullens, District Agent Middle Tennessee, Dist. II.

Mr. C. L. Brockett, Superintendent of Davidson County Schools.

Mr. A. B. Harmon, District Agent Middle Tennessee, Dist. II.

Mr. R. E. Clay, State Department of Education.

12:00-1:00, lunch.

1:00-3:00, games, directed by Mr. W. H. Williamson, Ass't State Agent in Negro County Agent Work, and Miss Bessie L. Walton, Ass't State Agent in HD Work.

Judging to start at 8:30 a. m.

Judges:

Miss Maude Guthrie, Food and Nutrition Specialist, Extension Service.

Miss H. Dean Simmons. Ass't Home Demonstration Agent, Davidson County, District II.

In charge—K. B. Gresham, Ass't Home Demonstration Agent.

Mr. Oscar Farris, County Agent, Davidson County.

G. W. Senter, Ass't County Agri. Agent.

Housing Needs of Negro Farm Families Described at Extension Workshop

"Although thousands of farm families are being helped by Extension Service agents to improve their homes, too many low-income farm people are still being passed by," declared T. M. Campbell, Federal Extension field agent, last week in a talk on rural housing before the Extension Service supervisors' workshop at Southern University, Baton Rouge, La.

Mr. Campbell, who was chairman of the two-week workshop, urged the 50 supervisors in attendance to stress the importance of rural housing in their conferences with county agents. "You ought to go out and get some first hand information on the housing needs of the people," he said.

Pointing to an enlarged photograph of a dilapidated farm home, the field agent told the supervisors that they ought to spend a night occasionally in a home like this with no sanitary toilet, no electric lights, no screens, and not half enough rooms for its eight occupants.

"Now I know that many agents are encouraging farmers to improve their homes; some are helping them to obtain plans and materials for building or repairing their homes, but I am afraid that we are passing by this family and thousands of others like it in our rush to make a showing," Mr. Campbell said. "Some of us drive 15 or 20 miles to get a good home to spend the night when we ought to spend it right where night catches us," the field agent added.

"Thousands of our people are living in homes that are actually falling down; when it rains they have to use every utensil in the home to catch the water," Mr. Campbell declared. "Some of our farm people have few bed covers and no sheets or pillow cases. Little children are growing up in these homes—children whose lives are threatened by diseases, and who are being robbed of the capacity to serve America," he continued.

"It's a fine thing to teach farm people to conserve their land, develop throughbred animals, and add the necessary labor-saving equipment to expedite farming operations, but unless we teach the farmer to direct all these toward the goal of better living, we haven't helped him very much," he concluded.

The supervisors' workshop was held for the purpose of improving the supervision of some 700 colored farm and home demonstration agents in the 15 Southern States. Similar workshops are being held for the supervisors of white agents.

Other Extension officials who addressed the group were John W. Mitchell, Federal Extension field agent, H. H. Williamson, assistant director of Extension Service, Charles A. Sheffield, field agent for the Southern States, and S. P. Lyle, in charge of agricultural section of Extension.

4-H Achievements

During National 4-H Achievement Week, November 2-10, the recital of outstanding accomplishments of the 1,800,000 white and colored 4-H'ers proved that this has been another big year. Achievement figures show that 4-H'ers put 150,000 acres in victory gardens this year and 350,000 acres in food crops; raised 11,000,000 chickens, turkeys, geese, and ducks, and 750 head of livestock.

Also 4-H club members canned 33,000,000 quarts of food, dried or cured 3,000,000 pounds of food, and stored or froze 10,000,000 pounds of food. Important too, is the fact that 4-H girls prepared and served 20 million meals this year.

In addition to growing and conserving foods, the 300,000 colored 4-H boys and girls have also been busy this year developing summer camps. In West Virginia 4-H'ers have a 700-acre site, complete with swimming pool, recreation hall, and dormitory facilities; in South Carolina the colored club boys and girls have secured a 265-acre site on Lake Marion and plan to build a $75,000 camp. In Georgia the camp is already under construction. State Agent P. H. Stone reports that an assembly mess-hall, valued at $8,000, is nearing completion.

India Cattle to Be Used in Dairy Experiment

The arrival of two young Brahman bulls and two heifers at the Beltsville, Maryland, dairy experiment station marks the start of a long-time breeding experiment which will be undertaken by the Department of Agriculture to develop better dairy cattle for southern climatic conditions.

The cattle, imported from Guam, are outstanding representatives of the Red Sindhi breed. They represent one of the most popular dairy breeds among the many breeds of humped cattle in India. They were obtained by the Bureau of Dairy Industry from the Agricultural Institute of the American Presbyterian Mission at Allahabad, India, in exchange for two bulls and two heifers from the Bureau's Jersey herd at Beltsville.

This will be the first experimental attempt in the U. S. to use an improved dairy strain of Indian qualities of resistence to heat, pests, and drought with the dairy qualities of domestic dairy cattle. Other breeds of Brahman cattle have been imported and crossed with American beef breeds and range cattle in the Coastal Plain area of Texas and Louisiana for nearly a century to obtain a hardy, fast-growing type of beef animal. Crosses with Jersey bulls and purebred Red Sindhi cows have been made at the Allahabad Institute for more than 14 years, with apparently favorable results.

In India the average yearly milk production per cow is about 1,000 lbs. A Red Sindhi cow must produce 2,500 lbs. of milk in 300 days to be eligible for registry in the Central Herd Book. Jersey bulls crossed on the Red Sindhi cows have sired 13 daughters, which last year averaged 4,700 lbs. a year, and the average in Louisiana is about 2,400 lbs.

The four imported animals arrived at Beltsville in good condition, despite the long and tedious journey from their native country. They will be kept at Beltsville for a short time, where the bulls will be mated to the heifer of their own breed and also to females in the Jersey herd. Eventually they will be sent to the Department's field station at Jeanerette, La., where the long-time breeding experiment will be conducted.

Spring Hill Cows Set Record for Butterfat Output

Columbia, Tenn., Nov. 11—(Special)—Cows in the purebred Jersey herd of George Campbell, Cleburne Jersey Farms, Spring Hill, have set an outstanding record for production of butterfat, it has been anounced by C. A. Hutton, extension dairyman of the University of Tennessee.

In a letter to Campbell, Hutton stated:

"Your two Jersey bulls have records as follows:

"Roseboy's Design Oxford has two daughters averaging 8,143 pounds of milk and 479 pounds of butterfat, and increase of 1,339 pounds of milk and 104 pounds of butterfat over the dams.

"Another daughter received the Meridale trophy given by the Meridale Farms and presented by the Tennessee Cattle Association. This qualified the bull as a proven sire.

"One of this bull's daughters qualified for the silver medal production award by the American Jersey Cattle Club.

"Also to receive the same rating is the Jersey sire, Astor Crimel Aim, he having seven daughters with high production of 8,269 pounds of milk and 482 pounds of butterfat. This bull has two daughters which received the silver medal award also. It qualified Duchess Rowertine as a Register of Merit tested dam giving her the rating of 9,297 pounds of milk and 619 pounds of butterfat on three daughters all of which received the silver medal production award."

USDA Scientists Seek to Improve Synthetic Fibers

Each of the four Regional Research Laboratories of the U. S. Department of Agriculture is working to develop or improve a synthetic fiber from a different agricultural product. These fibers are not intended to replace natural fibers. Research men believe that these synthetics may have qualities tnat will improve the natural fibers when the two are mixed.

All these experimental synthetic fibers are low in "wet strength." Many will understand that term by recalling that wartime rayon stockings needed to dry 48 hours because they tore so easily when wet. One research objective is to find ways to increase wet strength.

The Southern Laboratory has a new fiber, Sarelon, from peanut protein—of a light cream color and a texture reminiscent of both silk and wool. In heat-insulating and moisture-absorbing properties it resembles wool. It shrinks little and dyes well.

A fiber called zein, from corn protein, appears suitable for blending with wool for knitting yarns and woven fabrics. Zein is being produced experimentally at the Northern Research Laboratory. This fiber has a rich creamy appearance and a dry strength almost equal to wool. The time required for spinning and finishing zein fibers seems to be less than for other protein fibers. A commercial company is preparing to produce zein fibers on a pilot-plant scale.

At the Western Laboratory, chicken feathers are under test as fiber material. Feathers, as is true of wool, hair, hoofs, and horns, are composed largely of a fibrous protein called keratin. Chicken-feather fiber has been produced experimentally. Its chief weakness is "low wet strength." Feathers are a waste product available in quantity. Industrial utilization of part of the feather would be beneficial. Chicken-feather keratin also can be used in making excellent plastics.

Casein fiber, known for years, is being improved at the Eastern Laboratory. Research there has developed a continuous process for manufacture of casein bristles to substitute for imported hog bristles used in brushes. This process is more economical and yields a fiber more uniform than former methods. A commercial firm is interested in making casein fibers by the new process.

Cross-Cultivation of Cotton Reduces Production Costs

Cross-cultivation cuts cotton chopping costs to $1.20 per acre, reports the Arkansas State Extension Service. This means, U. S. Department of Agriculture officials say, that if cross-cultivation is adopted on a wide scale, thousands of white and colored workers, who depend on cotton chopping for a part of their income, will have to seek other types of employment.

The Arkansas report points out that one farmer, Knox Boshers, started cross plowing 150 acres of his cotton this year when the plants were small and plowed it eight times—five times with the rows and three times across. This reduced the chopping cost on this part of his farm to $1.20 per acre.

On the part of his farm which was not cross-cultivated, chopping costs ranged from $6 to $16 per acre, according to Mr. Boshers. He plans to cross-plow his entire cotton crop next year.

Grasshopper Expert on Way to Argentina

Dr. J. R. Parker, leading grasshopper control expert of the U. S. Department of Agriculture, left New York last week by air for Argentina. Dr. Parker is going to Argentina in response to the request of the Argentine government for an entomologist who can give technical advice on the control of a grasshopper outbreak which is now occurring over wide areas in that country.

Relieving the Steel Shortage

If steel producers are able to keep producing at their present record-breaking rate for peacetime, the shortages reported by some steel consuming industries should shortly be made up. That encouraging statement comes from Walter S. Tower, president of the Iron and Steel Institute.

The reason for the shortage, of course, is the strikes that plagued the industry not so long ago. The month-long strike that took place in January and February of this year, for instance, cost the country more than 6,000,000 tons of finished steel. The coal strike resulted in the loss of over 3,500,000 tons. Production since then has been hampered by a series of small strikes, and by shortages of scrap and other raw materials.

All in all, the total loss was some 12,000,000 tons of finished steel. That, Mr. Tower says, is enough steel for 900,000 automobiles, 70,000 farm tractor, and 7,000,000,000 tin cans— and after all those articles were made there would remain 9,,000,000 tons of steel for other purposes!

That is what strikes do to a nation's economy—and that's one big reason why you're having to wait for a car, a stove or some product requiring a substantial amount of steel to manufacture. The bright side of the picture is found in the fact that steel output now is at an extremely high rate, and the industry is doing everything in its power to meet the enormous demand.

Research Accelerates Cotton Mechanization

Cotton research as an aid to mechanization and economical production of an ample supply of the right kinds of fiber provides a good example of the present day complexity of scientific agriculture.

In the first place, says the U. S. Department of Agriculture, geneticists are developing varieties that produce good yields of the kinds of fiber wanted, cottons that are resistant to diseases and that are suitable for modern methods of harvesting and ginning.

Too, engineers are working up designs of all sorts of new machines for picking and new equipment and processes for ginning, cleaning and compressing the fiber. And finally, communities are being organized so as to limit them to the production of one suitable variety—a movement that now affects 40 per cent of the acreage and 45 per cent of the output of the Cotton Belt and enables manufacturers to cut costs and better their products.

Workers in one group may help to solve problems that had been considered up to another group. For example, cotton breeders are producing varieties with slick glossy leaves that do not stick to the fiber as ordinary rough surfaced leaves do. Such cotton makes it easier for the gin cleaning device to do its job and facilitates mechanical picking.

All-Pullet Flock Favored

The all-pullet flock for egg production is the thing for most general farms and even for many specialized poultry farms. Disposing of mature hens and keeping only the pullets is particularly practical and profitable for the small flocks kept in towns and suburban areas for supplying eggs and meat for the family, says T. C. Byerly, poultry specialist of the U. S. Department of Agriculture. Pullets are the best fall and winter layers. Older hens are most valuable on breeding farms that specialize in the supply of hatching eggs, according to Byerly.

Health and feed costs are the two main reasons behind the all-pullet policy. The all-pullet flock is not exposed to danger of diseases that the older birds are likely to transmit if the two groups are mixed. By clearing out the older birds each year the poultryman gets the maximum supply of meat, from the cockerel and pullet roasters surplus to the rearing of the annual replacement pullets.

92 Maryland 4-H'ers Get Awards for Outstanding Achievements

Ninety-two Maryland 4-H club boys and girls received cash awards recently at their annual Achievement Day exercises for outstanding farm and home improvement work, reports Martin G. Bailey, colored district agent of the Maryland State Extension Service.

Altogether, the Maryland 4-H'ers produced this year 250 acres of improved variety corn, 150 acres of vegetables, 10,000 chickens, and 700 hogs; raised 110 dairy cows, canned 16,000 quarts of food, and made-over 400 garments.

Dr. Edwin H. Shinn of the Extension office here in Washington was the principal Achievement Day speaker. He praised the club boys and girls for the excellent project work they accomplished this year. Dr. Thomas B. Symons, director of Maryland State Extension Service, also addressed the youth.

An outstanding feature of the program was the demonstration of improved farm and home practices by the boys and girls. Among the demonstrations were: preservation of eggs, preservation of food by canning, and the preservation of fence posts by chemical treatment. About 500 youths were in attendance.

Top Farm Production Called for in 1947

A continuing world need for the things U. S. farmers can produce is the reason behind Secretary Anderson's call for another year of top farm output and a consequent delay in transition to peacetime production levels. The total 1947 acreage sought is 358.5 million acres, about 3 percent more than actual acreage in 1946.

In announcing recommendations for national farm goals in 1947, the Secretary described the farm production job next year as (1) production to meet the needs of a strong domestic, (2) production to supply some of the foods and other farm products still badly needed in war-devastated areas, (3) a start toward rebuilding reserves of certain commodities and (4) working again towards a sounder program of proper land use and soil conservation.

White and Colored farmers are asked especially to increase production of such world-scarce commodities as fats and oils and sugar. This would permit meeting a larger part of U. S. requirements with domestic supplies, thus making additional supplies from other countries available to shortage areas.

Greatest expansions in acreage are indicated for cotton, flax, dry beans, soy beans, barley, rye, and grain sorghums.

Name State FHA Directors

Selection of 26 state directors to head up operations of Farmers Home Administration in their states has been announced by Willard B. Lasseter, Administrator. The Farmers Home Administration merges all credit facilities and services of the Farm Security Administration and the Emergency Crop and Feed Loan Division of Farm Credit Administration under an Act passed by the 79th Congress. The merger was effective Nov. 1.

The new agency will provide agricultural credit and on-the-farm supervision for direct and insured farm ownership loans, and production and subsistence loans. Credit facilities and supervision are available only to farmers unable to get the loans they need at interest rates not exceeding 5 per cent from banks, cooperative lending agencies and other responsible sources in their communities. The insured mortgage feature will not become operative until funds for the purpose are appropriated. Direct loan funds are available, however, from the 1947 appropriations for the Department of Agriculture.

Story of Electricity Covers Long Span of Years; Origin Is Traced

By KENNETH B. McPHERSON

Electricity is a common household tool today. It is used in every walk of life by the young and old, high and low. It is found in the city and country alike, silently doing jobs for people which otherwise would be a serious physical burden.

The story of electricity is an interesting one. That story covers a long span of years and introduces many people who labored and toiled that we today may enjoy its benefits. These people came from many different countries but the product of their labors has international use.

The origin of electricity can be traced to three discoveries that were made many years ago. It has been close to 2,500 years since Thales, a Greek philosopher, stroked a polished piece of amber and observed that rubbed amber draws to itself light particles such as lint and chaff.

The second discovery was probably made by a Chinaman. He found a dark, heavy stone that had the property of attracting, and even lifting pieces of iron. These stones with magnetic characteristics were called load stones.

The third part of the story began when the first man looked into the sky and saw the lightning flashing.

Science was practically at a standstill for centuries. It was not until the time of Queen Elizabeth of England that men really started to delve into the unknown to any large degree. One of her physicians, William Gilbert, discovered many of the principles of magnetism while experimenting with the load stone. He also gave electricity its name from the Greek word for amber, "elektron.' '

Almost every school boy remembers how Benjamin Franklin flew his kite during a thunderstorm in 1752 at Philadelphia and got the electric spark.

An Italian professor, Galvani, observed the way frog legs kick and twitch when two unlike metals touch them, and another Italian, Volta, made the first electric battery when he placed a piece of paper moistened with acid between a copper disc and a zinc disc. From Volta we draw the word "volt" which today expresses electric pressure.

In 1831 an American, Joseph Henry, an dan Englishman, Michael Faraday, performed the experiment that showed that an electric current is produced in metal when a metal is moved in the field of influence of a magnet. This experiment paved the way for most of the marvels which the force of electricity performs today.

The rest of the story is less than seventy years ald. The first successful incandecent lamp was made by Thomas Edison in 1879. Dynamos to generate electricity and power systems to utilize and distribute it were developed by such eager experiments as Edison, Thomason, and Brush. Stanley and his transformer; Sprague and his motors; and Steinmetz, the mathematician, all contributed their necessary part to make the production and distribution of electricity an exact science.

Men are busy today, designing, experimenting and testing. They are seeking new uses of electric power and each new discovery adds another chapter to the electrical story.

The young son of a professor spent the week-end on a dairy farm. Returning home he looked up one of his friends and related his experiences. "If you ever go to a farm, Jimmie," he cautioned, "and you see a big cow off to herself, in a stall with bars, and she has a ring in her nose and don't have any faucets, she's a bull and you'd better avoid her."

With Tennessee Home Makers

By HELEN CULLENS

District Home Demonstration Agent

Regardless of wheat economic and national problems face us, home problems remain the same in many phases. Making ready for winter means more than looking after the storing of fruit, making changes inside and outside the house, and so on. Even as we begin to get our fall and winter clothes ready for wear or make new purchases, we face the business of putting away spring and summer garments.

By the time we start wearing fall clothes, it is high time to make sure our summer things are put away safely for their annual "rest." All clothes, even your most rough-and-tumble ones, keep in better condition and last longer of you store them carefully during the seasons when you are not wearing them.

It pays to spend a little time with our clothes before we store them, enough time to see that they are ready to wear on short notice. This means cleaning thoroughly, and taking a stitch here and there, if need be. Then comes the time to store them well.

Take dresses first. Look over your washable dresses for stains. If they have any, try to get them out. Then tub these frocks thoroughly, and iron them, if you wish. Put them away in boxes or on hangers in bags ,to keep out the dust.

As for non-washable dresses, be sure they are clean, and then hang them in garment bags to keep them clean. Be sure to close all fastenings on these dresses; this will help to keep them in shape.

Now for summer coats or jackets. Make sure they are clean, and place on hangers, padded ones if you have them. Close all the fastenings and store them in protective bags.

If the coat or jacket is all-wool or partly-wool, give it protection After it has been washed or drycleaned, put the coat or packet in the protective bag with moth crystals, balls, or flakes in the pockets. Hang a bag of these moth preventives over the neck of the hanger. Seal or fold the edges of the garment so that the moths or beetles can't get in. Then hang it in a cool closet. If you have some wool or part-wool garments not soiled enough for laundering or drycleaning, give them a good brushing and airing. When you brush, be sure to get at the seams, because moths often deposit eggs in such places.

As for those summer shoes; give them a good cleaning before you store them. If they need repairs, it is a good idea to have the repairs made before you put the shoes away. Then these shoes will be ready to wear whenever you want them. Put your shoes on shoe trees and store in boxes, or a shoe cabinet away from dust. Be sure to store them in a dry place to avoid mildew.

You may have some shoes made from material that contains wool. If you do, put moth crystals, balls, or flakes in the box with them. Just to be safe, take the shoes out once in a while during the winter to see that they are free from moths.

Now for one more item in your summer wardrobe, those hats you want to save. Turbans, and soft hats with no particular shape can be packed several to a box with tissue paper for protection. To store large brim hats, pad the crown with tissue paper to hold shape and place in boxes with the brim side down. Veils and ornaments should be removed from the hat.

Your gloves, your handbag, your umbrella and similar accessories may not be the most important items of your wardrobe, but even they deserve extra care. When they give out, new ones may be harder to get than the strict necessities of clothing.

Just remember that proper precautions and care in the storage of clothing pays big dividends. Your clothes will be in good repair and good condition when you take them out next spring or summer

Make the Farms Hum

By GRACE ARMSTRONG ALLEN

Strange as it may seem, when you stand in mid-October looking at your bees flying in and out, you are not seeing the same bees you saw in May. Worker bees are short-lived.

Regular beekeepers know such facts of course, very well. But for those beginners who have a few hives, without ever having read or studied about bees, or giving them any particular care, this seems worth thinking about right now. The bees that were working so ferverishly to bring in white clover nectar in May and June probably lived not longer than six weeks. Those that began life in June and July or August may have lived as long as three months. Those starting their careers in the fall may survive the winter and start the activities of early spring.

Queens lay fairly generously in September and early October. That is very important, to produce these young bees to live through the winter. But by mid-October the daily deposit of eggs is definitely reduced. There is still considerable sealed brood in each hive, but not much open brood, and still less of eggs. That is as it should be. How long the queen will continue her dwindling laying will depend on the weather, and also on the resulting late flow of nectar.

Probably the drones have all been destroyed by this time, poor chaps. Queens lay no drone eggs in the latter part of the season, as drones are not carried through the winter.

One purpose of this column is to help such beekeepers as those referred tc above, who have made a start, but without the opportunity to acquire much information. Another is to persuade some farmers who have no bees to get some. But to this second group, my present advice is: Don't start right now.

Don't buy bees this fall, I mean. If you know nothing about them, you can not possibly judge their condition; whether the combs are good; whether they have enough winter stores; if they are queen-right, with plenty of young bees; or even that they are free from disease. Wait till spring—and read while you wait.

During this winter read and study all you can about bees and beekeeping. Send to the Department of Agriculture at Washington for bulletins about bees. Subscribe to a bee journal. There are several good ones. Some have national, even international, circulation. Some have departments giving advice from month to month on regular routine work. Every reading beekeeper (and that ought to mean every active beekeeper) has his favorite bee journal, which he will boost proudly and loudly if you give him a chance. And, of course, there are books. Perhaps your county agent can advise you.

Once upon a time a certain couple received this very advice and acted upon it. They were raising chickens in their back yard, and in a poultry journal they read a suggestion to add a hive of bees to one's backyard activities. So they wanted to buy some bees right away, but had no idea where to get any. At the State Fair they met a nice friendly beekeeper. "Will you sell us a hive of bees?" they asked eagerly.

"No," was the firm reply. 'You shouldn't buy bees now. You know nothing about them; and it's fall. Subscribe to a bee journal. read all winter, then buy a hive in March. You'll know something then. And spring is the best time to start."

So they read all winter, learned —among other things — what equipment was needed, and got it. Then when they bought their first bees in March, they had the proper tools and at least a little of what is today called the "know how." They knew how to open the hive, how to handle the frames, what to look for, and how to judge conditions. They even found the queen—and clipped her wing—with small scissors and trembling fingers!

Of course, they continued their reading, and from that spring on, you should have heard that back yard hum!

Chicken Feed Savings

Only a quarter of a century ago congressmen were distributing free garden seed to their constituents, but the practice was discontinued as wasteful. A billion dollars was still a figure looked upon with awe by our lawmakers. Times have changed since then. Now the taxpayer has more than garden seed to worry about in the way of government spending.

The popular order is to have the Federal government finance everything from kilowatts to fertilizer, and from local community spending to compulsory cradle-to-the-grave security. "No seed" is chicken feed savings too small to figure in the new order.

As the Portland Oregonian put it, "Sometimes we find . . . . we are wishing we were back . in the comparatively innocent, carefree and simple times when free garden seeds were considered to be an unholy political racket"

Negro Youth Congress to Aid Extension Agents

To help get needed farm and home improvement information to sharecroppers, tenants, and small farm owners, the Southern Negro Youth Congress is calling on its members to organize into committees during summer vacation time and assist Extension agents in getting their messages across.

The congress is suggesting that these youth committees make use of dramatics and music in the presentation and interpretation of important factual information about agriculture.

The suggestion for assisting Extension agents was contained in a resolution prepared by a SNYC farm panel and endorsed by the body at its recent convention in Columbia, S. C.

Other recommendations included in the resolution were: Increased credit facilities for low-income farmers, the inclusion of farm workers under the Federal Wage and Hour law, improved living conditions and medical care services in rural areas, and increased diversification in the cotton region.

Sherman Briscoe, an information specialist of the U. S. Department of Agriculture, took part in the panel discussion. Wayman Johnson, assistant State Extension leader for Negro work in South Carolina, was discussion leader.

Sorghums for Latin America

The great collection of grain sorghums the U. S. Department of Agriculture has assembled for its sorghum breeding program is also proving valuable for neighbor nations to the south. Tropical America are not good grain crops. U. S. commercial sorghums were tested and failed.

To improve the grain supply the Inter-American Institute of Agricultural Sciences has launched a sorghum breeding program that is showing results. Working at the Turrialba station in Costa Rica, breeders have been crossing grain sorghums to produce sorghums adapted to the conditions. Open heads to allow maturing grain to dry are important for humid ares; also disease resistance, good plant habit, and heavy yield. The Department's sorghum collection proved important because the Turrialba breeders could take advantage of the records of years of yield under varied conditions, and of disease resistance.

Four Decades of Medical Progress

An extensive study of prepayment medical service plans was recently made by Herbert D. Simpson, formerly Professor of Public Finance at Northwestern University. In an introductory chapter on the background of the movement, he traced its development in these words: "It is a movement that has been in process of gestation for some forty years. . . . It had its origin in the logging camps and early industrial communities of the Pacific Northwest. Here the dearth of medical and hospital service through the conventional channels compelled the people . . . to fall back upon their own ingenuity—with the usual result. They found a means for securing what was necessary.

"From these small beginnings in the early years of the present century the movement has grown. . . . until in 1945 the Social Security Board discovered 229 medical service plans in various parts of the country, exclusive of the Blue Cross and purely hospital association plans. . . .

"Far-sighted leaders have sensed the changing conditions, changing needs, and the enlarged potentialities of medical science and medical service. Committees have been appointed in probably every medical society in the United States. Representatives have been sent abroad to study the medical system of other countries. . . . It is in this sense that the large number of medical service plans recently organized represent not something new but only the logical outcroppings of a movement that has been going on for four decades."

Here is the answer to the charge that we have failed to meet our obligation in the field of public health. Here is the refutation to grandiose schemes for socializing medicine and turning doctors into bureaucrats. Voluntary medical prepayment plans are making rapid progress now, and they are effectively meeting the needs and desires of the American people without compulsory taxes and political raids on public treasuries.

Misinformed Consumers

Judging from a survey recently made by the Los Angeles Merchants and Manufacturers Association, the American public has a great deal to learn about merchandising. The survey revealed that most of the people queried were under the impression that more than half of the customer's dollar went for net profit to the lucky storekeeper.

That, as the saying goes, would be nice work if you could get it. However, the merchant is far from being in the golden position a misinformed public thinks he is. On the average, something less than five per cent of the customer's dollar represents net to the store. And in some staple lines, such as foods, where there are no style trends and obsolescence problems to add to the cost of operation, the net is often less.

Such figures indicate the injustice that is done when buyers' strikes and other consumer rebellions are directed at the storekeeper. It's all very well to protest at eighty-cent-a-pound meat and dollar-a-pound butter if you're so disposed—but place the blame where it belongs. Today's prices are simply the direct and inevitable reflection of today's governmental, industrial, agricultural and general business costs, and they can't go down appreciably unless those costs go down, which include labor and taxes.

The merchant, chain and independent, large and small, old and new, is doing a fine job under tough conditions. He's got problems enough without being blamed for those over which he had no control.

WIFE: "I think married men should wear something to show they're married."
HUSBAND: 'I do— this shiny suit."

Over Third of South's Farms

(Continued From Page 1)

ed by federal law.

Another $125,000,000 will be allotted this year at the discretion of Administrator Wickard. Southern States will also receive part of this loan fund.

Department__ officials point out that some colored farmers are making wide use of electricity to save labor on their farms. A few have electric pumps, feed choppers, brooders, hotbeds, and air compressors for mechanical milking machines. Farm women are using electricity to run their washing machines, heat their irons, light their homes, and operate their radios and fans.

REA power also is used to light rural churches and schools. Electricity for the schools helps out in more ways than one. In some communities it has marked the beginning of courses in electricity for white and colored youngsters in high school. In these courses, students learn about fuses, switch boxes, how to wire houses, and repair electrical equipment.

The two Negro high schools that are most outstanding for their courses in electricity are the Dinwiddie Training School at Dinwiddie, Virginia, and the Valley View High School at Valley View, Texas.

Mandatory Meat Grading Discontinued

Missing from much of the meat now being sold over the counter will be the purple Federal grade stamp that has become so familiar to consumers during the last few years. Reason for its absence is that Federal grading is not compulsory since OPA ceilings on meat were removed on October 15. However, Federal grading service is still available to packers and slaughterers on an optional basis. During the war, between 90 and 95 per cent of all the meat sold in the United States was Federally graded. It was stamped Choice, Good, Commercial, or Utility as judged by an impartial official grader.

Extension Helps Hait ian Study Farming in U. S.

Lucien Cantave, left, Hatian agriculturist, is being aided by Extension Service in studying farming methods and extension techniques firsthand. He is shown with County Agent L. A. Crew of Hale County, Ala., examining an ear of corn. Mr. Cantave spent two months with Mr. Crew, and eight months on a farm. His study program as outlined by Extension Service calls for a short stay in the Extension office at Tuskegee where he will study administration before returning to his post as extension specialist at the Haitian National Agricultural Experiment Station.

Byrd Nest

(Continued From Page 1)

God moves with the Trinity in all things. Their movement was like lightning, and when it was up and down it gave the appearance of a wheel moving within a wheel. When righteousness moves, it is with such rapidity that no man can determine its speed. God a wheel of power turns in man who becomes God's wheel of action. Through these provisions Salvation is blown to your door.

Negro Community Completes 5-Year Improvement Plan

A model colored farming community with neat, well-painted homes, and modern conveniences has been the outcome of a five-year beautification program in Union County, Arkansas, in 1941, says a report received by the U. S. Department of Agriculture from the Arkansas State Extension Service.

The report points out that colored home demonstration club women chose home beautification as a project when their homes had to be moved to make way for the erection of an ammonia plant. The club women met with Miss Marguerite P. Williams, colored home demonstration agent of the county, and planned a five-year home improvement program.

Included in their home improvement is a well-rounded home food production program: year-round gardens, poultry flocks, milk cows, and home orchards.

Cotton Situation

World exports of cotton regained half their wartime losses in 1945-1946. In 1945-46 cotton mill consumption increased considerably in a number of the war-torn European countries. Domestic consumption in September ran above the August level, and at an annual rate of slightly more than 10.2 million bales. With total consumption for the year at about 9-1-2 million bales and exports at 3.0 million bales, the carryover on August 1, 1947 would be reduced to something less than 4 million bales. This would be roughly half the carryover on August 1, 1946.

The 1946 cotton crop is now estimated at 8,274,000 bales of 500 lbs., gross weight as compared with 9,171,000 in September. This is the smallet crop ince 1921, and compares with 9,015,000 bales for 1945 and the 1935-44 average of 12,553,000 bales. The lower estimate in October production is attributed to drought conditions that continued into September in some areas and also to low temperatures which retarded development of cotton in areas and where there was considerable late planting.

Shelby County Future Farmers

lumber he could find and called the carpenter to come take a look at it. The carpenter measured the scrap lumber and then gave Clarence a new estimate of $79. He was still $49 short even if he cashed in his bond, but he did have two calves which he planned to raise. Perhaps he could sell them.

A week later, Clarence had sold his calves and enough vegetables off his crude table to plunk down the $79 without touching his bond. By the middle of July his market was finished and he had made arrangements to buy fruits, vegetables, chickens, and eggs from neighboring farmers and resell them at his market. Clarence calls his market the "4-H Club Roadside Market," and he permits all 4-H'ers to sell on it who wish to do so.

Last summer, a year after the 4-H market had opened, Clarence was grossing as much as $20 per day during the peak season, and his books showed that he had done slightly over $3,000 in gross volume during the year.

In order to raise more of his own produce for market, Clarence began sharecropping 200 acres with his high school principal this year. He put five acres in sweet corn, three acres in sweet potatoes, two acres in watermelons, an acre in cabbage, an acre in tomatoes, and a fourth of an acre in lima beans, and several rows of string beans, cucumbers, beets, and carrots. Also, he planted 30 acres to cotton, 30 acres to corn and left about 100 acres of pasture land for his brood stock of 15 calves which he bought this year. Clarence hired most of the chopping and picking of his cotton but did all of the plowing himself with a tractor.

It is Clarence's plan to go to college and learn all he can about livestock and dairying. "Thirteen miles from Memphis is a good location for a dairy," he says. This, of course, will be in addition to his profitable curb market.

4-H Achievements 136,000 Farmers Insured Cotton Crop This Year

In order to protect their crop from unavoidable hazards, 136,248 white and colored tenants and owners insured their cotton this year, said G. F. Geissler, manager of Federal Crop Insurance Corporation, in an address in Detroit last week.

Reviewing the administrative problems involved in developing a workable crop insurance program, Mr. Geissler summed up by saying that the need for this type of protection for the farmers who produce the food and fiber of our county is so apparent that the greatest possible effort should be made to develop a workable program which will give them protection against losses over which they have no control.

"All of us have seen many individual farmers and whole agricultural communities sink from prosperity to bankruptcy and become dependent upon relief and charity through no fault of their own," said the FCIC manager.

Continuing, he added, "The agricultural economy of this country can never become really stable as long as food and fiber production must be carried on unprotected from these hazards."

Mr. Geissler said that FCIC had about $280,000,000 worth of insurance in force this year, partially covering our wheat, cotton, flax, and corn crops. Corn was insured only on an experimental basis. He pointed out that estimates indicate an increase of 65 per cent in the number of insured farms in 1947 as compared with this year.

Remedy with People

Editor E. T. Leech of the Jittsburgh Press, a Scripps-Howard newspaper, says the public "has been kicked around, fought over, punished and persecuted. It has been deprived of essential services and goods. It has been inconvenienced by sudden stoppages of vital facilities. It has lost wages and profits and savings through disputes in which it had no part and against which it had no safeguards.

"The constitutional guarantees of justice, domestic tranquility and general welfare have been made a mockery. Government has surrendered and groveled, trying to appease reckless men who put themselves above laws and elected officials.

"We have had strikes against the public and the government, strikes against employers and strikes against rival unions, strikes against contracts, strikes against official awards, and untold thousands of strikes so obscure and trival in origin that nobody ever quite knew what they were about. . . .

"And what can we, the people, do about it?

"Something, surely, for under our government all strength lies in the people. . . .

"The basic solution to our troubles is in the national legislature—in a policy of putting public welfare above preferential treatment of any group."

Lawrence Washington Transferred

McClain, Holly Springs; Gladys Goodson, Lockhart; Mary J. Powell, Fletchers Grove; Bettie Peebles, Jefferies Grove; Annie B. Justice, Rolesville; Elsie F. Alston, Apex; Malissa Ferrell, Riley Hill; Corine Nicholos, Lovely Hill; and Mary E. Dunn, Sandy Fork.

The Achievement Day program was under the direction of W. C. Davenport, Mrs. B. M. Edwards and Allene Brannon of the State College Extension Service.

Throwing away tobacco stalks is throwing away a lot of good fertilizer as they are rich in nitrogen and potash.

Don't Burn Raked Leaves, They Make Fine Fertilizer

By Dr. Floyd Bralliar
Garden Editor
The Nashville, Tennessean

Leaves are falling rapidly and many trees are already bare. The common practice for years has been to rake up all leaves and burn them—this in spite of the fact that leaves when decayed, or even partly decayed, are worth at least a dollar per bushel to any gardener.

Any one who has sufficient room need only rake his leaves off the lawn and put them in a big pile in an out of the way place and throw brush or large weeds over them to prevent their blowing away and allow them to decay. This will require two or even three years; but if a little manure or even a little garden soil is mixed into the pile of leaves they will decay much more rapidly.

If you do not have room for a large heap of leaves, get a piece of wire fence netting of proper length, and fasten it together into a clyinder and set them in some out of the way place and fill it with leaves. Weight these leaves down with a heavy stone and a short board or two that can be easily removed when ready to add more leaves. It will be well to sprinkle a handful of lime in such a pile of leaves two or three times as you fill it up. If the leaves are not ready for use by spring, plant a morning glory vine where it can run over this wire cylinder and you will have a thing of beauty all summer and by fall the leaves should be ready to work into the soil where ever you need them.

Will decay Rapidly

If you mix a few weeds or lawn clippings with these leaves when filling the container the whole will decay more rapidly . and will be just as valuable when ready for use as if all leaves had been used. No gardener can afford to burn his leaves or waste vegetable matter. However weeds and grass are best incorporated in a heap, but we should not use too many dead leaves in the heap for they are likely to delay its getting into condition to use too long.

We have just received letters from some of our Belle Meade garden contestants that contain a number of very interesting observations, which we quote, with comments:

"An observation from your column revealed no cure for wilt; accordingly I transplanted tomatoes from a cold frame enough for home consumption, leaving two seedlings. On the west end of the garden I grew two other seedlings, I gave all plants the same care, suckling, staking and etc. The two sets of seedlings suffered no wilt, while the transplanted vines suffered considerably. My theory may not hold—but this incident indicates that gardeners are entirely too careless in transferring their plants to the field. Could this be part of the great wilt secret?"

Plants More Robust

Undoubtedly seedling tomatoes that have never been transplanted are more robust and therefore more resistant to disease of any kind than are plants that are transplanted, especially if this is done carelessly. We have long advocated planting tomatoe seed for a later ormain crop directly where they are to grow and ripen. However, bright (or wilt) is a bacterial disease that is carried through the air, and the only practical way to be sure of avoiding it is to use varieties that are known to be wilt-resistant. At the present time Pan-American, Marglobe, and Rutgers are probably the most resistant.

"I had quite an onion bed with little garden space for berries, so, into the onion bed went the berry plants which grew with the onions until the onions were removed. The berries have practically covered the ground now and are in wonderful condition for a good crop next year."

Strawberry Plants

Your plan of setting strawberry plants between the rows of onions or other quick-maturing plants is a good one, and is especially practical where garden space is limited. You will find that you will get just as many strawberries in this way, and can cultivate two crops at the same time without any loss to either.

"Two hills of regular old yellow field pumpkins at the end of the garden grew so prolifically that I decided to prune the vines, saving only one branch which I turned in along the garden path. The one branch reached the length of 45 feet, and supplied us with an abundance of young pumpkins (which we cooked like squash). This would be helpful only to small gardeners, but it gave terrific production to our garden."

The pruning of pumpkin and square vines, as well as the vines of the watermelon, has been a common practice for many years, and this is certainly practical where space is limited. You might be interested to know that we saw plenty of pumpkins this year on the Burgess Seed Co's. seed-growing farm that never made any vines at all and were strictly bush pumpkins, yet bore prolifically. The seed of these will probably be on the market another year.

Negro Farmer Manages Timber of Sound Basis

Alonzon Williams, 65-year-old farmer of Pachuta, Miss., is managing his timberland so that his children and grandchildren will have a source of wood supply when they need it, reports Mississippi State Extension Service.

When Williams bought his farm in 1914, the timberland had just been cut over. "There was nothing here but little saplings, 12 to 14 feet high," he said recently, as he walked through his woodland with his county agent and pointed to some trees that have grown into 24-inch sawtimber.

Although Mr. Williams has drawn on his woodland for fence posts and firewood frequently, he made his first important cutting for the market four years ago when he sold 16,000 board feet.

He was planning recently on making another cutting, he said, for sawtimber and had six acres marked to cut for crossties and pulpwood. The cutting would be done by himself and his grandson. Mr. Williams said when his timber was marked he had in mind the thought of leaving his woodland in better growing condition. "You see," he explained, "I have several boys and grandsons and I want them to have this timber some day."

Brentwood Cow Establishes New Production Mark

J. T. Granberry, of Brentwood, owns a registered Holstein-Friesian cow that has just completed a 291-day production record in offical herd test of 13,104 pounds of milk and 492 pounds of butter fat. The record was officially announced this week by the Holstein-Friesian Association of America.

The cow was four years and 10 months old when the record was started. Unlike many records that are attained through milking three times daily the Granberry's cow was milked only twice daily.

The association pointed out the new record was more than two and one-half times the production of the average milch cow in the nation.

World Cotton Production Much Below Average

The world's cotton production for the 1946-47 crop year is tentatively estimated at 22,050,000 bales by the U. S. Department of Agriculture. This is the smallest crop, except last year, since the 1923-24 crop year.

Revised estimate for last year's crop places total production at only 20,440,000 bales as compared with 30,875,000 bales as a prewar average (1935-36 to 1939-40).

Town in North Carolina Is Demonstration Center

Credit Union, Started in 1936, Proves to be Inspiration for 27 Similar Groups

By Alden Stevens
From The Nation

"I've just been chasing some cows that got over the fence," said Neil McLean, of Brick, N. C., dusting off his impeccable gray herringbone. He looked more like a city business man than a rural schoolteacher. "We've got some champion polevaulting stock here," he smiled. His wife, who had greeted us while he was chasing cows, excused herself to look after a child, and he walked along with us toward a row of gnarled crepe myrtle trees.

"I understand you have a new kind of education here," I said. "And that you started the first rural credit union for Negroes in the state. I'd like to hear more about it."

"The credit union was started in 1936, but it was the people around here that really made it work," he said. "Anyway, it's only a small part of what we do." It was, perhaps, a small part of the Bricks Rural Life School Project, but it was the inspiration for 27 other rural credit unions in the state. Twenty-five of them were started in the past four years, and some are larger now than the original.

He told me about the early days. The Negroes in the little community at Bricks and on the surrounding farms couldn't see how they could possibly save any money. They didn't have any. Every year they took their peanuts and their tobacco and cotton to the storekeeper, who gave them credit on which to buy flour and supplies. They couldn't argue about his bookkeeping, partly because they didn't understand it and partly because it wouldn't have been wise. They were always in debt.

Storekeepers Object

When the credit union was organized, the storekeepers objected, and when Negroes began to come in with credit-union money and pay up, they accused McLean of taking their people away from them. When a little later McLean opened a cooperative store at Bricks, his enemies threatened to wreck the whole program. It was a long time before this opposition was overcome.

The credit union played no bookkeeping tricks on the farmers who built it up with nickles and dimes. They borrowed from it at 6% instead of at the 30 to 50%, and even higher, they had been paying. Every year some families borrowed from it to finance the purchases of land of their own. Eight families borrowed down payments last year.

McLean was right when he told me it was only a small part of his work at Bricks. For the people in the neighborhood, and especially for a selected group of families signed up for five years each on the school's 1,100-acre farm, he is providing a new and better education for rural life. The children learn about vitamins and health as they learn to read, write, and figure. Very early they learn how to have a vegetable garden; in North Carolina they can grow greens of some kind all the year round. They learn about the need for rotation and soil-building feed crops, as well as about the best metthods of getting good money crops like peanuts, tobacco, and cotton.

Canning Plant

Bricks has a much-used, battered, but spotless canning plant, and more than 17,000 quarts of fruits, vegetables, and meat went into tin cans and glass jars last year. Families come in groups and make quick work of putting up their peas, tomatoes, pork, and beef. McLean urges his people to keep cows and hogs, which furnish natural fertilizer. With this, and proper compost heaps, the need for commercial fertilizer can be sharply reduced. This is the big yearly cash purchase and the item which most often drives small farm families into debt.

A rural health program is carried on at Bricks; there is a clinic with a nurse on the job and a doctor who comes in at stated times. Emphasis is on preventive medicine—775 typhoid shots were given in 1945. Pre-natal and child care are other specialties.

Many Visitors

Bricks is not a large project. It works only with the people within about 15 miles of the settlement. But it is one of a rapidly growing chain of educational centers for Negroes in the South. It is a demonstration project, and people from all around come to look and learn. The families who go out from it to their own places often become demonstrators themselves. Like the centers at McIntosh, Ga., and Athens and Marion, Ala., it was originally sponsored and is now partly supported by the American Missionary Association.

I asked McLean about the Southern Conference for Human Welfare and other organizations which are trying to gain a better political position for his people. He said they were important and that he was for them. He had long been urging his people to vote at Bricks, and most of them did. "Such organizations are good." he said, "but I think people have to work for things themselves to get anything lasting out of them. If we can get poor people to work together, as families and as communities, I think we've accomplished something. Others then see that it is possible for them to get what they all want—a place of their own."

'Cooperative Consumer"

Poor Sheep Management Causes Losses

By Paul P. Hite

Why are so many ewes lost during the late fall and winter months? The answer, in most cases, is poor flock management. Most farmers are busy with their fall harvesting and sowing winter cover crops at this time of the year and their sheep are neglected. They do not realize that the care given the flock at this time will determine the next lamb crop and the following year's profits.

Too many ewes lose flesh after the fall pastures are gone and it is too early to graze the winter cover crops. The ewes look fat on account of the wool but their condition cannot be determined unless they are examined on the back and ribs to see if they are well covered with flesh. If they are not kept gaining in weight, it may cause pregnancy disease or lambing paralysis at lambing time and result in the loss of the ewe and the lamb.

Do not let the flock go into the winter heavily infested with internal parasities. If the ewes have had access to one to nine phenothiazine and salt mixture and treated now with the phenothiazine drench or bolus, they should not need any other treatment during the winter. One interesting thing that has recently been brought out is that ewes in late pregnancy often abort when dosed with phenothiazine.

Many sheep are lost every year from hemorrhagic septicemia, often called shipping fever. It is often caused by the animal being exposed to sudden changes in the weather or crowded into poorly ventilated barns. In acute cases, death may result within 24 hours after illness first appears. Chronic cases usually develop into pneumonia, lasting from a few days to several weeks. The flock may be protected against this disease by vaccinating with hemorrhagic bacteria in the fall of the year.

Sheep prefer to be in the open but during the lambing time and in extreme cold weather, it is better to put them in a shed or barn. The building should be well ventilated and free from drafts.

If a good winter pasture is available, very little hay and grain will have to be fed. Strong lambs will be born and ewes will have more milk, if one-half pound of grain per head per day and leafy legume hay are fed from two to three weeks before the first lamb is expected. Feed hay and grain in a suitable rack and trough. Do not let the sheep eat hay from around hay stacks. Trash will fall in the wool and this lowers the price from 10 to 15 cents per pound. Separate the ram from the ewe by middle of November. A ewe that isn't bred by this time should be sold on the market.

Better sheep, lambs and wool will make a better Tennessee.

Your Life at Stake

Suppose that every productive acre of farm land and every farm building in the great agricultural state of Washington, with all its orchards, wheat fields and truck gardens was suddenly wiped out. That would be an inconceivable and unprecedented disaster.

Yet fire—uncontrolled, man-caused fire—is taking just such a toll from the people of this country. The last census gave the value of Washington's farms as $593,000,000. And that's about what our national 1946 fire loss will be.

The gravity of the problem has been well described by Frank A. Christensen, president of the National Board of Fire Underwriters. "Seven years ago the upward trend in fire losses began," he said. "During the war years we explained it away by charging it to increased activity or industrial and mercantile operations, undermanned fire departments, obsolete and inefficient fire fighting facilities, and public preoccupation with the war effort. However, it has now been more than a year since cessation of hostilities. The trend in fire losses has continued unabated, resulting in destruction of material and supplies at a time when they are vital to the reconversion of our economy . . . .

"Only once and possibly twice before in our history has waste by fire all over the country been so menacing to our national welfare as it is today."

We cannot escape our responsibility by saying that fire control is somebody else's business. It is our own, personal business. It comes down to the state, the town, the district, the home—and finally to the individual, whose carelessness is the greatest cause of fire. Every man's life, every man's property, every man's savings, is the stake in the fight against fire.

State Potato Acreage Reduced for Next Year

The Tennessee share of the 2,660,800-Acre national potato goal established for 1947 is 39,000 acres, Cary Fry, state director of the Production and Marketing Administration, said today. This is compared with the 41,000 acre potato goal recommended for 1946. The national goal is 116,000 acres below the acreage planted in 1946.

Fry pointed out that this year's national goal under average conditions should produce approximately 375 million bushels of potatoes, enough for all normal needs. Based on average yield per-acre figures, the Tennessee goal should produce more than 2 3-4 million bushels.

Goals for individual farms will be established by County Agricultural Conservation Committees which will notify the growers.

Tobacco Yields Double

Wolfe County, Ky., farmers now are disappointed if they don't produce at least 1,200 pounds of tobacco to the acre, whereas 10 years ago yields of 600 to 800 pounds were considered good. County Agent Chas. E. Gabbard said today. On most of the good farms yields have more than doubled, he added.

Growing disease-resistant types of tobacco following cover crops and the use of fertilizers and manure, added at least 100,000 pounds to the Wolfe County crop this season, the county agent declared, and will bring to farmers an extra $30,000 to $50,000.

Free collective bargaining means bargaining free of Government interference except for those activities normally involving mediation or conciliation. . . . To assure that collective bargaining is really a two-sided affair, Congress must revise the Wagner Aet to correct its one-sidedness and to assure that responsibility goes along with power.—New York Times.

Economic Pointers Given Farm Leaders

Farmers of Tennessee and the nation, facing what is expected to be a period of great uncertainty in prices for their products, were warned this week that they must exercise sound judgment in all agricultural activities if they hoped to cope with problems ahead.

The warning came from J. L. Anderson, University of Tennessee extension service economist, who in addressing some 300 county extension workers at their annual conference in Memphis, suggested a nine-point program aimed to "weather out any economic storm."

1. Avoid speculation. Sell crops and livestock when ready for market.

2. Beware of high priced land unless particularly needed to greatly increase operating efficiency and in case purchase can be made on a cash basis without depleting needed operating capital.

3. Do not assume long-time obligations on the basis of present income level.

4. Improve land and build up productive capacity of the farm.

5. Make changes in the organization of the farm to increase efficiency in the use of labor.

6. Consider the use of labor-saving machinery and equipment.

7. Cull out low producing livestock.

8. Consolidate and refinance, on a long time basis, debts that cannot now be paid.

9. Make every attempt to produce as efficiently and at as low cost per unit output as possible.

"Past trends, together with the present situation, suggest that in 1947 and the year just ahead may be a period of more price uncertainty than has existed in many years," he declared.

Anderson reminded that almost all wartime price controls on farm products have been lifted and the course of prices is again reverting more nearly to the law of supply and demand. He said that one of the big questions today is how long will demands for farm products support prices at their present level?

The group was told by the economist that as long as employment and the purchasing power of the non-farm population remained high good prices might be expected for farm products under the present rate of production. But as the purchase power of the nonfarm population dwindles and as production of farm products increases, we may expect noticeable changes in prices of products, he said.

"Foreign demand, mostly for relief, has been heavy, but this is through 1947 at recent high levels. The agriculture economy of the country has become adjusted to high production about one-third higher than the pre-war 1935-39 period. Indications are that productions during this year will set a new record," he continued.

Anderson warned farmers to take every point into consideration before making purchase of additional land, especially if it meant taking chances on losing the land you now owned. "Even though farm land reached a peak soon after World War I, prices being paid for farms today are about 10 per cent higher now than then," he said.

Dogs Not Responsible for Most Sheep Losses

Only 1.6 per cent of the 62,285 sheep insured through sheep growers association in Tennessee this year were killed by dogs, according to Paul P. Hite, sheep specialist with the U-T extension service.

Though dogs are the greatest worry of many sheep breeders, Hite said, the losses from other causes, that could be prevented through better management, were much greater.

Coal for the World

A healthy American coal industry is important, not only to the United States, but to the welfare of the entire world. That is the story which recent export figures tell.

We have been shipping some 2,000,000 tons a month to other countries, and experts forecast that this foreign demand will last for seven or eight years. On only two previous occasions, when British miners were on strike, has so much of our coal been sent abroad.

Two factors are primarily responsible for the world's appetite for American coal. First, mines in the war zones are still below normal production. Second, the enormous job of rebuilding war-torn Europe demands an abnormallly large supply.

On top of that, England, once a major coal exporter, is now shipping little outside her borders. Socialization of her coal industry, which was one of the first moves made by the Labor government when it came to power, has not increased coal output. Instead, production has tended to decline, miners are as dissatisfied as ever, and this "great experiment" has proven largely a failure.

So, as the world looks to America for much coal, conditions in our coal industry become a matter of international importance. Should ever-recurring labor difficulties damage coal production, many other countries will suffer. If we are to continue to produce enough coal for ourselves and others, the industry must be kept healthy and permitted to go ahead without governmental hindrance or shutdowns.

High Prices no Friend of Retailers

Retail distributors, through no fault of their own, have fallen into an unenviable position. Price controls have been largely abandoned. Dammed up rises in costs are now battering through the channels of production. Retailers have no choice but to let the flood move on to consumers. They are in the position of "personally" introducing the public to the tragic reality of inflation.

There are a few things in these tumultuous days that retailers hope the consumers will keep in sight. Probably most important is the fact that progressive retailers are opposed to rising prices as wholeheartedly as any one. Modern distributors operate on a high-volume, low-price basis. This is particularly true of chain stores which supply life's necessities to millions.

Another thing to remember is that in the long run competition in the freemarket is the only sure road back to stability and plenty. The United States has a highly competitive retail distribution system. Chains, supermarkets, independents and others are working to get their share of the business. Under these circumstances resistance by retailers to unjustified price increases is automatic and relentless.

These favorable factors cannot control inflation. But they mean that consumers will get as fair a break as possible—far better than ever before under like conditions in the history of this or any other country.

"This country needs both big business and small business, and in a freely competitive system the natural American genius and striving for accomplishment, that has been demonstrated so often in the past, can be relied upon to preserve a sound balance between the two."—Excerpt from the July letter, National City Bank of New York.

'Excuse me," said the mild little man in the crowded cafeteria, who had returned with a cup of coffee, "but you have my seat."

"Oh, yeah," growled the big man. 'Can you prove it?"

"I think so, Sir," the little man murmered timidly. "I left my pie and ice cream in the chair."

Farm Elevators Reduce Crop Handling Chores; Save Money

By KENNETH B. McPHERSON

Elevators for lifting and conveying many heavy loads will be found saving tired human bodies on post war electrified farms. They have been used to some extent in the past for lifting baled hay, sacked and loose grain and ear corn.

Any one who has had farm experience knows that there is no pleasure in lifting 80 pound hay bales and pushing them way over head into the hay mow. There is usually a man in the barn who hooks the bale and pulls it onto the floor after having leaned out into space. Even when the bale is in the barn, the stock grows higher and higher so that each additional bale goes up nearer the roof which is no cool place in summer.

It is almost as bad to scoop ear corn out of a wagon bed into a crib. The hole through which the corn is thrown is always in the top of the crib which requires the man who does the unloading to exert every ounce of strength he can command. Even then two or three ears from every scoop full will fall back into the wagon or on the ground.

That kind of labor quickly makes an old body on a young man. It is also one big reason why there is such a shortage of farm workers in the country today. The boys who have tried it are seeking employment in places that are mechanized to a point where higher wages and only a small amount of severely hard hand labor are required of the worker.

World War II has brought farm elevators both portable and stationary types into a wide demand. Not many have been available but a serious consideration of them is now taking place. During the war, men were simply not available to crib corn or carry sacked grain into mow storage rooms. Older farmers and young school boy helpers were simply unable to take their place; but electrically operated elevators could. It is reasonable that the use of such conveyors will reduce the farmer crop handling chores to a minimum, thus saving him time, labor, money and effort.

Several devices for elevating are being manufactured now as fast as materials become available. For small grain and shelled corn, some are using the blower principle, similar to that used on ensilage cutters for elevating the freshly chopped silage over the side of the silo. This same principle is found in straw stickers on threshing machines. Other manufacturers use the moving cleat or bucket elevator principle.

Except for very large farms or special jobs, the small portable, general use conveyors are suitable and desirable. They are all metal, built on light wheels, and can be readily moved from one building to another. There is a large hopper near the ground into which corn can be pushed from a wagon or truck bed. Hay bales can be set in the hopper and conveyed to any desired height.

The motor size on any elevator depends on the amount of grain to handle and the elevating speed desired. In general, portable elevator motors range from one-half to one horse power.

Sugar Beets Mechanized

A shortage of farm labor in recent years has intensified the search for machines which could reduce the amount of labor required in the weeding, thinning and harvesting of sugar beets, the Department of Agriculture reports.

Continued development and widespread use of effective machines for planting, thinning and harvesting may reduce considerably future costs of producing sugar beets, according to a Bureau of Agricultural Economics study of the growing mechanization of the crop.

Continued Wheat Seeding Is Urged for Grain, Feed

Wheat seeded now should not be attacked by the Hessian fly, according to H. W. Wellhausen, Extension Agronomist, U-T College of Agriculture, in reminding farmers that wheat may be sown throughout November, and even into December. Fly-free days are here now; and ther is still time to get good returns from wheat, as grain, seed, or feed.

A disc harrow is all that is needed for most wheat land now. The grain can be seeded with a drill, or broadcast and harrowed in. To obtain the maximum production, farmers are urged to prepare their best land first, and keep seeding as long as weather will permit or until the entire crop is sown. It should be remembered that as the wheat seeding season advances, it becomes more advisable to use proper kinds and amounts of fertilizer.

The wheat crop produced can be utilized in many ways. If the grower does not have access to a grain harvester, the wheat can be cut for hay, or it can be "hogged off."

Plant Contest Winners Are Announced

Brownsville, Tenn., Nov. 4—(Spl.)— F. J. Worrell of District One of Haywood County was declared winner in the 1946 "Plant to Prosper" contest in the land-owned division

He will enter competition for the sweepstake prize in the annual "plant to prosper" contest in Memphis in December.

Worrell's family consists of himself, wife, and four children. He bought his present farm eight years ago through the Farm Security Administration and since has followed the plan devised by home and farm supervisors of the Farm Security Administration. Total receipts from the farm for 1946 were $4,590 with cash expenditures of $1,267.88, leaving a net gain of $3,322.62.

In the tenant division Guy Lovelace of Brownsville, Route 4, Holly Grove Community, was winner. He won third place in the State for 1943-1944. He has an approved application through the FSA to purchase the farm where he now lives.

Norvell Stuart of Brownsville, Route 5, was judged county winner. He lives on the Rankin farm in the Wilson Community and moved to the farm three years ago, finding the buildings and land in very bad condition. He has made improvements that made him outstanding among all other entries.

Farmers Tests Show Hybrid Corn Value

"No more experimenting for me. It's all hybrid corn from now on," George Corum of the Goose Rock community in Clay County, Ky., told Farm Agent William C. McClure. Corum figures he lost at least $100 a year by not having the entire field planted to hybrid seed during the past two years when he has been comparing this variety with common corn.

Corum planted half his field with hybrid seed and half with common corn. They had the same fertilizer treatment and were planted and worked on the same days. When the corn was gathered, the common corn yielded 59.9 bushels per acre and the hybrid variety, 74.9. Stalks of the common corn were badly blown and twisted, while the hybrid corn had no fallen stalks.

This was the second year Corum had carried on this test. In 1945 he grew the common variety where the hybrid corn was this season. He experienced the same trouble with the common corn being blown down, McClure said.

Frozen Food Industry Aids Farm Income

The frozen foods industry which did not exist in Tennessee 10 years ago is now bringing millions of dollars yearly to farmers of the State; and added income appears to be limited only by the capacity to produce high quality agricultural products, Harry Carlton, Extension frozen foods specialist, U-T College of Agriculture, said today.

This has been brought about, Carlton pointed out, through team-work of several departments of the university. The wild blackberry harvest is cited as an example. The bacteriology department was helpful in determining best picking and handling methods; 4-H Club specialists organized club members to gather berries; county agents and home agents helped on harvest plans and in setting up collection routes; marketing specialists and others lent a hand. And the result this year was that the wild blackberry harvest, covering some 25 counties for frozen foods firms, brought more than a half million dollars to pickers. Some 5 million pounds, that is, brought an average of 12 cents per pound, in addition to commissions to handlers and haulers.

Roughly, eight million pounds of strawberries were required to pack more than nine million pounds of finished product. Producers received an average of 25 cents per pound or approximately two million dollars. Some frozen foods firms are now talking about doubling their pack next year.

Beans going into the frozen foods market brought producers more than a quarter of a million dollars; and many packers are now utilizing apples.

"Our greatest problem is getting enough high quality products grown to supply frozen foods firms," Carlton said. "All of the leading plants are now in process of expansion, or are making plans to expand."

Soaring Prices Fail to Stem Auto Demand

Detroit— (AP)— The lifting of price controls on new and used automobiles brought a heavy volume of old cars and many not so old to the nation's used car lots but it did not lessen the demand for factory deliveries.

This is shown in surveys by various agencies of both the used and new car markets.

The dealers in used vehicles generally report increased stocks of cars—at considerably higher than the former OPA ceiling prices. At the same time they assert that persons with cars to sell are demanding much more than the original prices, even for pre-war models.

Some virtually new 1946 models are appearing in used car lots. The demand for them and older cars holds up, even at prices reported in "some instances to be nearly double the original cost.

The premium prices, of course, are paid chiefly for immediate delivery and the demand for vetinue, according to the dealers, just as long as factory output remains below retail requirements.

Most of the manufacturers appear agreed that capacity production may not be expected within the next six months and that immediate delivery by new car dealers still is a long way off.

Now Comes the Elkburger

Walla Walla, Wash.— (UP)— State game officials, answering the farmers' call that roaming elk have been damaging crops, have been killing elk and giving the carcasses to country schools in southeastern Washington. The elkburger is a favorite on the school lunch menu.

A Lesson in Appeasement

John D. Battle, executive secretary of the National Coal Association, an organization representing the bituminous coal operators, recently wrote: "It will be interesting to see what steps the government takes to protect the people from a coal shortage now that the government occupies the place of mine manager. There are many around Washington who consider this a challenge to the government's authority. At the same time it must be remembered that the government sought the role that it is now playing by taking the coal mines over almost a year after the shooting-war had ceased—took them and gave the union a contract involving a number of unsound principles as viewed by the coal mine owners. This is another lesson in appeasement. It is rather difficult to retrace the steps once taken without great danger to the dignity of the government."

It is time the American people realized that the real issue in the coal industry has gone far beyond any question of wages, hours or working conditions. The very prestige of government is at stake. And so long as high government officials back down when faced by the ruthless demands of a private organization—a single labor union—we can only look forward to continued disruption of the vital coal industry.

One very important fact developed by the long-standing soft coal difficulties is that government operation of the mines (which is no more and no less than nationalization or socialization of the mines), affords no guarantee whatsoever of an uninterrupted production of the nation's basic fuel supply. There is no magic in nationalization. A progressive coal industry, keyed to the demands of the time, can only be achieved under private ownership—buttressed by labor laws and agreements which respect the rights of management no less than the rights of labor.

Responsive to Our Needs

Government ownership is often urged as the remedy for all our real or imagined economic ills. But, in practice, socialized industry seems to have a habit of falling far short of the roseate dreams held out by its starry-eyed advocates. A good example of that can be found along the Oregon Coast where some years ago a People's Utility District (PUD) took over the facilities of the private utility that had long served the area.

Since this PUD came in, the principal change has been an almost unbelievable decline in the standards of electric service. Complete stoppages are frequent. Stringent rules cover the use of electricity and the hook-up of appliances. This is quite a change from the old days when the private utility automatically provided all the juice desired when and where wanted, under strict public regulation from which the PUD is exempted.

As a result, communities which joined the PUD believing they would get plenty of power for practically nothing are now looking at it with a jaundiced eye. The city council of one of the larger towns in the region recently passed unanimously a resolution to get out of the PUD and set up a municipal plant. Another of the larger towns has long been restive and is looking for a way out. And in the meantime, the consumer gets a kind of power service that would immediately bring the toughest possible crackdown from public service commissions if it were provided by a regulated, private company.

What this all adds up to is that socialism produces nothing of itself—except, as a rule, political bungling, red tape, and waste. Only private enterprise is responsive to the needs and desires of the people. That goes for power service—and it goes for all other kinds of business as well.

Maybe there is a time for everything, but this is not the time for farmers to speculate, farm management speeialists advise.

Cotton Picking Nears Completion

There were 10,809,000 persons at work on farms in the U. S., on November 1, the Bureau of Agricultural Economics reported. This total is the largest for November 1 since 1942, although only slightly more than a year ago. Declining seasonally, the number at work was nearly three-fourths of a million persons less than on October 1. This decrease was twice as large as that of a year earlier but smaller than the 1935-44 average decrease.

A total of 8,306,000 farm operators and unpaid members of their families were doing farm work on November 1 in the entire counrty. This number exceeded the 1940-44 average for November 1. The number of hired hands on November 1 totaled 2.503,000, a slight decrease from a year earlier.

With cotton picking nearing completion in the southern part of the South Atlantic States, the number of farm workers on November 1, both family and hired, dropped sharply during October, as usual. The number of hired workers was less than a year ago when there was still much cotton to pick: However, an increase in the number of family workers kept the total of all persons to work on farms above the total of last November

Major farm work in addition to picking cotton, included corn harvest, seeding of fall grains and peanut harvest in mush of the region, tobacco stripping in Virginia and West Viginia and citrus harvest and cultivation of vegetables in Florida.

The number of hired workers in the East South Central States on November 1, was considerably less than last year. A smaller cotton crop and much better progress in harvesting it than a year ago decreased the need for hired workers. Family workers number a few more than last year. Cotton picking was nearly completed in Alabama and Mississippi and corn and peanut harvest were making good progress. Tobacco stripping was getting well started in Kentucky and Tennessee and corn harvest was under way.

Hired workers employed on farms in the West South Central States totaled considerably more on November 1, than a month earlier. Delays in picking cotton in Oklahoma and Texas were largely responsible both this year and last for an unusually large number of hired workers on November 1. In comparison with a year ago there were fewer hired workers on November 1, in this region.

Major farm jobs included corn and cotton harvest in all States of the region. Spring sown crops were nearly all harvested in Texas, except in the High Plains Area. In Louisiana rice harvest was about completed and cane harvest beginning.

Clothing Cold Clothing Hot,

Scienitfic tests fail to support the old belief that heavy clothing keeps out heat as well as cold, say Hazel M. Fletcher and Bess V. Morrison of the U. S. Department of Agriculture in reporting results of an investigation of textile qualities that included materials of a variety of fiber contents and construction. The laboratory work on these fabrics included tests before and after dry cleaning and laundering and were designed to measure fabric values for clothing purposes. The report, which appears in the current issue of the Journal of Home Economics, says in part:

"Research has shown that heat transmission of fabrics is complex and depends on many factors. In textile materials there is a close connection between thickness and warmth retaining properties. Thick fabrics, especially those of wool, have a greater ability to keep in body heat than the thin materials. Texture is also a factor. A coarse-textured or fuzzy cloth feels warmer than a smooth one of the same thickness because it makes less contact with the skin and encloses a layer of air which is an excellent insulator.

Therefore, when the climate is hot and humid, thin flat fabrics make the most comfortable clothing."

How Big?

In an editorial concerning efforts to limit the growth of business, particularly in the merchandising field, the Christian Science Monitor said: "Bigness is invariably the end-product of successful competition. When bigness achieves power, it wields it sometimes for good, sometimes for evil. It has some natural limitations. . . . For the rest, restraint and discipline designed to curb abuses of bigness should be our aim rather than some nostalgic taking to maintain and articicial and frequently uneconomic small- and historically impractical underness."

"Bigness" in merchandising came in almost every instance out of "smallness." The leading chains, for example, in both the grocery and the general merchandise fields, began as single stores—and small stores at that. Their growth is simply the reflection of public approval of their service to consumers. So people patronized them—and the stores grew.

Despite the emergence of the national and regional chain system, the position of the independent, far from being imperiled, has been strengthened. As the Monitor points out, bigness has its natural limitations. The one-store merchant can provide special services which set as a magnet to trade.

This country's economy is based on fair competition between all kinds of business, big and little. If we penalize size, we, by inference, ask the unanswerable question: "How big can a business be allowed to grow?" We must never forget that the big operation of tomorrow is a small and unknown operation today.

Farmers Home Administration News

Washington D. C.—Credit facilities and services of the Farm Security Administration and the Emergency Crop and Feed Loan Division of the Farm Credit Administration were merged into a new agency, the FARMERS HOME ADMINISTRATION, on November 1, 1946.

Public Law 731, Eeventy-ninth Congress, (the Farmers Home Administration Act of 1946) approved by the President on August 14, 1946, authorizes credit services under the Secretary of Agriculture for farmers who eannot get the loans they need at prevailing rates (but not more than 5 percent) and terms in their communities from banks, cooperative lending agencies or other responsible sources.

The Act amends the Bankhead-Jones Farm Tenant Act, and authorizes the following types of credit.

TITLE I

Farm ownership loans up to the reasonable value of the farm and necessary improvements, to buy, repair, improve or enlarge family-type farms. Loans may not be made for the acquisition or enlargement of farms which have a value, as acquired, enlarged, or improved, in excess of the average value of efficient family-type farm-management units in the county or locality where the farm is located. These loans are repayable over a period of 40 years at 3 1-2 percent interest. THE FARMERS HOME ADMINISTRATION is also authorized to **insure 40-year loans by private lenders** for the same purposes as the farm ownership loans. The amount borrowed can be up to 90 percent of the reasonable value of the farm and necessary improvements. Insured loans bear an annual charge of 3 1-2 percent, the lender receiving 8 1-2 percent interest, and the Government 1 percent for insurance and administrative expenses. (Funds for mortgage insurance have not been appropriated).

TITLE II

Production and subsistence loans up to $3,500 for buying livestock, seed, feed, fertilizer, farm equipment, supplies, and other farm needs; for refinancing indebtedness, and for family subsistence. This operating credit will be for periods up to 5 years, at 5 percent interest. The loans are similar to the rural rehabilitation loans previously made by FSA, and the crop loans of AC & FL. They will include supervisory services where necessary.

Veterans who served in the U. S. armed forces in any war with another nation will have preference for direct and insured mortgage loans. Disabled veterans will be eligible to buy, repair, or improve farms adapted to their capacities, provided their farm income plus their pensions will be enough to pay living and operating expenses and retire the debt.

A special condition under which all loans are made requires that if at any time it appears to the Secretary of Agriculture that the borrower may be able to get a similar loan from a cooperative or private credit source, under terms prevailing in the area, and at an interest rate not exceeding 5 percent, he must apply for such a loan and, if granted, accept it and pay off his debt to the FARMERS HOME ADMINISTRATION.

All-Pullet Flock More Profitable

The best evidence of the value of an all-pullet flock is abundant now with pullets laying 20 to 30 per cent more eggs during this period of high egg prices. Extension poultry specialists of the U. T. College of Agriculture said today. Thus is answered the question frequently asked of poultry specialists: what are the advantages of an all-pullet flock?

The first-hand evidence now available should be noted, too, poultrymen report, since it will soon be time to lay plans for next year's flock. Here are further points to consider in deciding on an all-pullet flock:

Pullets produce eggs more economically than hens, they produce 20 to 30 per cent more than hens, and lay more during fall and winter months when egg prices are highest. All-pullet flocks are healthier than mixed flocks; they break possible disease cycles. The feed eaten by a growing pullet is about equal to that eaten by a molting hen. Housing, feeding and management practices are simplified when an all-pullet flock is kept.

Farm Wife's Help Worth $69,000, Editor Says

Chicago, Nov. 11—(IP)—A farm wife who helps her husband is worth $69,000 to him, a woman agricultural editor said today.

Gertrude Dieken, an editor of the Farm Journal, Philadelphia, made the estimate in a talk to the National Farm Elictrification Conference.

Urging farmers to buy equipment to electrify home services as well as production, she said, "The farmer will be better off if he relieves his wife of carrying such unprogressive things as water, wood and coal, so that she may have a chance to concentrate on that $69,000 cooperativeness."

The man who undermines his own business (farming) with poor soil management will soon have no business of his own to mind.

"Soapless Soap"

Most people consider petroleum products as chiefly used for fuel and lubricants. As to volume, this is correct, but as to variety of uses it falls far short of telling the story. In addition to the countless services this production renders mankind, we may soon be using oil to wash our hands and clothes.

The demand for petroleum derivatives in the manufacture of "soapless soaps" has been spurred by the natural soap shortage which resulted from the decline in supply of animal and vegetable fats. One of the leading American oil companies has joined with a chemical manufacturing concern in stepping up production of an oil-derived detergent. The product is sold directly to industrial users and reaches established trade outlets for distribution under various trade names.

This is but one more way in which oil is playing a role in the American home and business. Its uses and adaptations seem almost limitless. The great experimental and research laboratories which the industry maintains are finding new and varied applications almost daily. And the consumer gets more and better products.

What About Your Clover Crop?

The problem of getting a stand of crimson clover in August, the time of the year it should be seeded for best results, has been solved by at least one farmer in the state. He is O. C. Woodie, Sr., of Waraen County, who has been growing crimson clover for a number of years but learned only recently that a much better stand could be obtained by sowing the clover with buck wheat.

"I'm not sure that the buck wheat is totally responsible for the fact I get good stands of clover in dry weather but I know other farmers who seeded at the same time I did this year and who used no buck wheat. I got a good stand that 'stuck' and their's died out," Woodlee said.

He believes that many farmers are missing a "bet" by not producing more buck wheat. "I have found that I can make enough money out of buck wheat to pay all expense of seed, fertilizer and labor in seeding the winter cover crops," he declared. Woodlee, with his two sons, grew more than 50 acres of buck wheat this fall—the yield of which was cut short by the extended dry weather. However, the average yield is above 20 bushels per acre and the seed is being sold for $1.20 per bushel in the field. "Even though our yield is short, the gross income will be approximately $25 per aere, which is more than the cost of all seed, fertilizer and labor in getting a good stand of clover and rye grass, and we do have a good stand," he said.

The Warren County farmer believes that more farmers should take advantage of the fast-growing buck wheat as a "catch erop" for grain. "One can usually tell whether his grain crop is going to be short by seeding date for buck wheat, and could easily save himself from having to buy expensive grain later in the year," he said. Pointing out that any type of livestock would eat buck wheat. Woodlee said he believed he obtained as good results from feeding it to livestock as he did from other grains, especially to poultry and hogs.

Another practice carried out on the Woodlee farm is that of seeding rye grass with lespedeza. Woodlee believes that every acre of land seeded to lespedeza should also be seeded to rye grass. He said that farmers in that area learned long ago the value of lespedeza as a pasture and hay erop but failed to realize the fact that the ground on which the crop grew was left bare during the winter. Soil on which the crop is grown is often left loose and is more apt to wash. This is especially true on land where the lespedeza was cut close for hay or pasture.

When rye grass is grown in combination with the lespedeza there is a growing crop on the soil at all times. Woodlee has found sowing the two together to be very profitable. The rye grass provides early spring and late fall grazing and the lespedeza provides good summer grazing or a hay crop. In addition he can pasture the rye grass until late May, take the livestock off and within a few weeks harvest a crop of rye grass worth more than the amount of corn that could be produced on the same soil.

Another valuable fact about rye grass is, though it is an annual grass, it reseeds itself year after year. One field on the Woodlee farm has been in rye grass for seven years, yet it has been seeded only one time. During this period the field has been plowed up twice.

WOMAN'S PAGE

Home Dressmaker Advised to Shrink New Woolen Fabrics

A new wool dress that comes back from its first trip to the cleaner's a size too small is a tragedy in any woman's life. To avoid it, wool goods of any kind should be properly shrunk before it is made up by the home dressmaker.

Some retail stores shrink all wool goods before offering it for sale, but this is a point to make sure of when buying. Many conflicting directions have been given for shrinking wool at home. Pressing the entire piece of wool with a steam iron is a simple and satisfactory method, if care is taken to hold and press with the weave and not to stretch or pull in the process.

Without a steam iron, it is necessary first to dampen the wool thoroughly and then press it with a moderately warm iron under a press cloth. Rolling the wool in a damp sheet is a simple way to dampen it. Dip a sheet in water, wring it out, then spread it flat on a table and lay the wool material, flat and straight, on the sheet. Roll sheet and wool together firmly but not tightly. Allow to stand overnight. Then press wool on the wrong side under a dry press cloth, with no pulling or stretching.

If the fabric is extra wide, it may be easier to leave it doubled, as it comes in the bolt, during dampening. If so, the roll should stand a few hours, then be reversed and re-rolled so that the entire piece will shrink evenly before pressing.

PROTECT LAMPSHADES

You can protect your new parchment lampshades from soil—and make them very easy to clean—by waxing them with a good self-polishing wax.

GIVE COAT PROPER CARE

Here's how to take care of any coat you value. When you're wearing it, always brush it free of dust, lint and powder, unbutton it and pull it up slightly in back if you're sitting for any length of time, avoid wearing down the nap with the friction of your handbag and packages, and always treat it as if you just bought it. When it's off, hang it up to air, and if wet, dry it away from direct heat. Use a wide-shouldered hanger, in a roomy closet. Brush it clean with firm but soft bristles, and never store your coat unless it is spotlessly clean and protected from moths.

Bride is believed to be derived from an ancient Teutonic word meaning "to cook."

TIP TO TEENAGERS

Teenagers will find that the use of a special cleansing preparation makes it much easier to keep their skin fresh and free from blackheads and minor blemishes so common at that time of life. After washing the face shake a little of the powdery meal into the palm of the hand and add enough water to form a paste. Spread the mixture over the face and let dry. With a dry washcloth, scrub briskly. Rinse off with warm water and a splash of cold. This treatment leaves the skin clean and glowing with natural color.

HOT FRUIT COCKTAIL

A hot fruit cocktail for cold-weather refreshment is recommended by Harold J. Clay, honey marketing specialist of the U. S. Department of Agriculture. Mr. Clay's recipe is as follows: One cup of grapefruit juice, one-half cup of grape juice, and two tablespoons of honey, mixed and heated until just hot enough to drink.

STUFFED CUCUMBERS AND BEET SALAD

Cut large cucumber inhalf crosswise. Pare with fluted knife and remove center from each end with an apple corer. Fill center with finely chopped cooked beets mixed with vinegar and with 1 teaspoon of gelatin soaked and dissolved in 1 tablespoon cold water. Chill thoroughly. Cut in slices and serve in nests of lettuce leaves.

RICE SPOON BREAD

Heat 3 cups milk in double boiler. Add 2 tablespoons margarine or butter. Sprinkle in gradually 1 cup ground rice. Cook 5 minutes, stirring constantly. Let cool. Beat 2 egg yolks thoroughly and add to cooked rice. Sprinkle over surface and stir in vigorously 1½ teaspoon salt and 1 teaspoon baking powder. Fold in 2 stiffly beaten egg whites. Pour into well-greased 1 quart casserole. Bake in moderate oven (375 degrees) for 30 to 45 minutes. Serves 4 to 6.

BAKED STUFFED FISH

3 shredded wheat biscuits
1 egg, slightly beaten
1 tablespoon minced onion
1 tablespoon chopped celery leaves
¾ teaspoon salt
⅛ teaspoon pepper
⅛ teaspoon poultry seasoning
2 tablespoons melted fat
2-3 cup hot water
1 fish (about three pounds)
1 12-ounce can vegetable soup

Roll cereal to make 1 cup crumbs. Add egg, seasonings, fat and water; mix well to make stuffing on one half; cover with other half of fish; place in shallow baking dish; pour over soup diluted with ¼ cup water and bake in moderate oven (350 degrees) 30 minutes. Serve with lemon wedges. Makes 6 servings.

BEEF CUTLETS ON TOAST

1 pound ground beef
1 teaspoon salt
½ teaspoon pepper
2-3 cup milk
2 tablespoons butter or margarine
Toast diamonds
Onion sauce

Combine ground beef, salt, pepper and milk. Shape into cutlets. Panfry in butter or margarine and place on toast diamonds. Place onion sauce on hot platter and arrange the toast with cutlets on top of the sauce and garnish with sprigs of parsley. Serves 4.

STICK CANDY HELPS MAKE APPLE BUTTER

Despite the sugar shortage, Mrs. John Moore of Boyd County, Ky., will have an ample supply of apple butter for her family this winter. Using red and white peppermint stick candy for sweetening she has filled a number of jars with a delicious pink apple spread. This is the recipe she gave Home Agent Lois M. Sharp:

To two gallons of cooked apples, add two pounds of crushed red and white peppermint stick candy. Place the mixture in an uncovered roaster or other large pan in a medium oven, 350 to 400 degrees, for three to four hours until the butter is of the proper consistency. Stir frequently. Seal in jars. Two pounds of candy will supply the sweetening and flavor needed for about four pints of apple butter.

BRAN SPICE MUFFINS

2 cups bran
½ cup light molasses
1½ cups milk
1 egg, beaten
1 cup sifted flour
½ teaspoon salt
1 teaspoon soda
1½ teaspoons cinnamon
¾ teaspoon ginger
15 thin slices raw apple or other fruit
Cinnamon and sugar mixture

Add bran to molasses and milk and allow to soak for 15 minutes. Add egg. Sift flour, salt, soda and spices together and combine with bran mixture. Fill greased muffin pans two-thirds full. Dip apple slices in cinnamon-sugar mixture and place on top. Bake in moderately hot oven (400 degrees) about 20 minutes. Yield: 15 muffins (2½ inches in diameter).

CRANBERRY BAVARIAN

1 envelope plain unflavored gelatin
¼ cup cold water
1 one-pound can jellied cranberry sauce
¼ cup sugar or ½ cup light corn syrup
1 tablespoon lemon juice
⅛ teaspoon salt
2 egg whites

Soften gelatin in cold water, and dissolve over hot water. Crush cranberry sauce with fork and combine with sugar or corn syrup and lemon juice. Add gelatin and stir well. Whip egg whites and salt until stiff, and fold into cranberry mixture. Turn into individual molds (or one large one) that have been rinsed in cold water. Chill until firm. When ready to serve, unmold onto dessert dishes. Serve by itself or with a custard sauce made with the egg yolks. Serves six.

KIDNEYS IN BROWN GRAVY

12 lamb or veal kidneys
¼ cup flour
3 tablespoons lard or drippings
1 cup liquid from cooking vegetables
2 tablespoons meat extract
Black pepper to taste
1 teaspoon salt
¼ cup finely chopped celery
2 tablespoons minced onion

Roll washed, dried kidneys in flour and brown slowly in hot lard in heavy skillet. Add remaining ingredients; cover tightly and cook over low heat about 30 minutes until tender. Make gravy from liquid in pan by adding 2 tablespoons flour blended with ¾ cup meat stock or bouillon and cooking 5 minutes until thickened. Makes 6 servings.

ORANGE TORTE

½ cup shortening
1 cup brown sugar
1 egg
1 cup sifted flour
½ teaspoon soda
1 teaspoon baking powder
¼ teaspoon salt
1 cup buttermilk
1 orange
1 cup raisins
1 cup uncooked oats

Cream shortening, gradually add sugar, creaming thoroughly. Add egg and beat until light and fluffy. Sift together flour, soda, baking powder and salt. Add to creamed mixture alternately with buttermilk. Squeeze orange. Grind orange rind and raisins through medium blade of food chopper. Mix with the orange juice and fold into batter. Add rolled oats, mixing lightly until combined. Bake in a greased 7x11-inch pan in a moderate oven (350 degrees) for 45 to 50 minutes. Serve warm with hard sauce or whipped cream. Serves 8.

CRANBERRY PIE

½ cup sugar
2 tablespoons flour
¼ teaspoon allspice
1 teaspoon grated lemon rind
½ cup honey
1 tablespoon margarine or butter
3 cups cranberries
2 cups diced raw apple

Combine sugar, flour, allspice, salt, lemon rind, honey and margarine or butter in saucepan. Cook 2 minutes. Add cranberries and apples and cook until cranberries burst about 5 minutes. Let cool. Pour into pastry-lined 9-inch pie pan. Arrange pastry strips crisscross on to top cranberry filling. Bake in hot oven (45 degrees) 35 to 40 minutes.

With Tennessee Home Makers

By HELEN CULLENS

District Home Demonstration Agent

Today is not one day too early to prepare various items scheduled for the Christmas holidays; and fruit cake heads the list, with most of us. Fruit cakes and plum puddings have a common origin and have been, for generations, a symbol of the Yule celebration. This applies to several countries of the European continent, as well. In this country, the fruit cake is well established as the main item of its kind, and there are very few homemakers who do not bake at least one before the Christmas season comes.

In making a fruit cake, the best procedure is to get everything ready before you begin the mixing of the cake. Prepare all the fruits and nuts first. Pick them over very carefully, wash and dry the fruit, cut up citron or candied pineapple, and make sure that there are no bits of shell among the nuts and that they are sweet and fresh. Let all the ingredients stand in the kitchen until they are of room temperature. Line a well-greased tube pan with greased paper. If you cook the cake very slowly, in a very moderate oven (about 300 degrees), you need not steam it first. When the cake is done, cool it on a rack before wrapping it in waxed or parchment paper. Be sure to store it in a tight tin.

Although many families have their traditional recipe for fruit cake, others may be interested in the one given by the nutrition specialist of the University of Tennessee Agricultural Extension Service:

FRUIT CAKE—1 lb. butter; 1 glass grape jelly; ½ teaspoon nutmeg; 1 lb. crystalized cherries; 1 lb. citron; 1 lb pecans; 1 cup grape juice; 1 lb sugar; 1 tablespoon melted chocolate; ½ teaspoon allspice; 1 lb crystalized pineapple; 1½ lbs seeded raisins; 1 lb almonds; 1 teaspoon rose extract, if available; 12 eggs; 1 tablespoon cinnamon; 1 lb flour (4½ cups); ½ lb crystalized orange peel; 2 lbs jam or preserves, and ½ lb. walnuts.

Cut up fruit day before and pour grape juice over it; grind almonds and pour over them 1 teaspoon rose extract. Sift flour with spices. Cream butter and sugar, then drop the eggs in one at a time and beat thoroughly after each addition. Add jelly and chocolate and one-half of flour. Sift remaining flour over top layer of fruit, add to batter, sift again, and so on, until all fruit has been added. Put in nuts. Pour into tube pans with 2 thicknesses of brown paper greased. Decorate top with fruit and nuts. Bake in a slow oven at 275 degrees F., 30 minutes per pound, or until a toothpick comes out clean. Do not open the door for at least one hour.

The majority of homemakers, I think, prefer the conventional, dark-fruit cake. Perhaps the origin of fruit cakes has something to do with this preference. In the beginning, plum puddings held first place in the list of Yule dishes and still has a high rank in England. It is from the plum pudding that the fruit cake, as we know it, came. However, in the last few years, the white fruit cake has become more popular. Probably the main reason is the novelty of seeing a fruit cake of light color. As has been said before, the use of white, or light-colored fruits and nuts, accounts for the color. Here is a recipe for White Fruit Cake, which you may like to have:

WHITE FRUIT CAKE—1 cup shortening; 2 cups flour; ¼ cup pineapple juice; ½ lb white raisins; ¼ candied lemon peel, finely cut; ¼ lb dates, coarsely cut; 1¼ cups pineapple tidbits; 1 cup sugar; 1 teaspoon salt; ¼ pound shredded coconut; ¼ lb dried apricots, coarsely cut; 2 cups sliced blanched almonds; 5 eggs; 1 1-2 teaspoons baking powder; ¼ lb pressed figs, coarsely cut; ¼ lb candied cherries, sliced.

Cream shortening and sugar thoroughly; add eggs one at a time, with 3 tablespoons of the flour, beating well after each addition. Reserve ½ cup flour for fruit; add remaining flour, sifted with salt and baking powder, alternately with the pineapple juice, beating well after each addition. Add floured fruit and nut meats and stir only until well blended. Pour into greased mold or tube cake pan lined with two thicknesses heavy paper. Decorate top with glazed pineapple, slices of almonds, cherries and citron. Bake in a slow oven (275 degrees) for 1½ hours, then increase heat to 300 degrees and bake one hour. This recipe makes about five pounds of cake.

Good Housewife Looks Neat, Even in Kitchen

By ANTOINETTE DONNELLY

According to one of our well known radio and recording stars, if you can act like a queen with an apron on, you'll never have to worry about how you look in an evening gown.

There's more than a kernel of beauty truth in this statement You just cannot turn charm and grace and good manners on and off like the kitchen faucet. You can't suddenly convert a whining, querulous voice and personality into a beloved and popular guest at a party.

We were thinking of this in connection with a compliment a nice, busy, and competent housekeeper and homemaker received from her teen-aged daughter. "Mom," the youngster said: "You're wonderful. You always look swell. I'm never ashamed to bring the girls home with me!"

It seems a pal of the daughter's was bemoaning the fact that she didn't like to bring girls home with her because her mother never looked nice unless she got dressed up to go somewhere. It's reasonable to assume that when this mother did get dressed up, something was missing, if no more than her poise, ease, or confidence.

The habit of being dressed up is not fixed. We don't mean one has to be dressed like a queen in her kitchen but she can still look like one in the readily available and pretty house frocks and if she attends her good grooming habits religiously. One of the nicest things about a mother's good appearance is just the appreciation it engenders in her young ones, to say nothing of the good example it sets for that girl's own marriage later.

Women who are always presentable enough to answer the doorbell are, as a rule, better housewives and homemakers than those who are not.

Fresh parsley will keep for several weeks if sprinkled lightly with water, placed in a jar, and stored in the refrigerator.

The ideal temperature for long storage of potatoes is about 40 to 50 degrees.

Poultry keeps longer if stored whole rather than cut up. It should be washed carefully before being placed in the refrigerator. spice into the soup.

Vitamin E prevents rancidity in lard, butter, dried milk, and chocolate.

THE BYRD NEST

By Rev. Bernard O. Byrd
—Guest Columnist.

THE SPIRIT MAKES MEN SERVE

In the two preceding messages or articles taken from the creature spoken of in Ezek. 1:10, we have seen revealed character and authority of Christ and of his followers. In this article, as we turn our attention to the face of the ox, we are forced to think of Christ and the Christian as servants.

Among the many obstacles in the path of progressive practical Christianity, one is ignorance of the fact that following Christ involves service. Surely no well taught converted person even approaches the belief that a man can be a Christian without rendering definite and constant service to God by serving humanity.

It is characteristic of men to throw away things from which they can get no service. In fact, we often cast away things which render some service but because it is such a small amount, we prefer not to keep the articles. The only excuse for keeping anything and taking care of it, is that it renders some type of service. Even a picture must serve the desire of man for beauty, comedy, or mystery. It is less likely that we should expect God to invest wisdom, special information, protection, provisions, and unlimited joy in persons from whom he can get no service. It will never be necessary for a man to pray often or vociferiously for the things he needs if he works for God and is productive in his labors, like the man who shines his shoes which serves his feet, and tailors his clothes which serve his body. God will supply all the needs of his servants.

Without a doubt the face of the ox is used because so many of his habits parallel the actions of a divinely guided worker in God's vineyard. Just to refer to some of these traits will perhaps inspire the reader to stick closer to his job, and be more encouraged even when the burden is heavy. The ox is not born a servant; he must be broken from his naturally wild disposition and trained along certain definite lines. If he is not first broken and trained, the service will be both poor and destructive, and in many instances it will hinder the quality of service rendered by others who must work with the unbroken animal. It is not necessary to explain in detail that the same conditions exist in the church where unconverted persons are trying to work along with well broken spirit filled servants.

A well trained ox needs only a yoke for his work. He is unlike the horse which must have belly-bands, trace-chains, back-straps, bridles, lines, etc. and then a whip to keep him working. When in God's kingdom it becomes necessary to fasten a multitude of lines, straps, chains, bridles and so forth

Colored Extension Supervisors Urged To Help Farmers Plan Better Homes

Georgia Home Demonstration Agents Association Held Annual Meeting At Ga. State College

By Mattie P. Mathis, Association Journalist

Industrial College, Georgia—The members of the Georgia Home Demonstration Agents' Association held their third annual regular meeting on December third, in the Community House at Georgia State College. The home demonstration agents of Georgia were here for the purpose of attending the annual agents' meeting which is held annually for all Negro agricultural extension agents in Georgia, which meeting was held at Georgia State College, December 2-7.

This association was organized in January 1944, and this was its third meeting. All Negro home demonstration agents in active service in Georgia are members of the association.

During the December third meeting the following officers were elected for 1947; President, Mrs. Mayme Wesley, Bibb County; Vice President, Miss Lottie Jordan, Grady County; Secretary, Miss Pauline Wilcher, Laurens County; Treasurer, Miss Rubie O'Neal, Meriwether County; Journalist, Miss Mattie P. Mathis, Liberty County; Parliamentarian; Mrs. Margaret Teemer, Peach County; Program Committee, Miss Reatha Mae Oliphant, Chairman, Effingham County, Miss Bernice Bewers, Bulloch County, and Miss Mary Clarke, Mitchell County; Social Committee, Miss Ruth E. Watson, Chairman, Chatham County, Miss Ocie B. Kendall Ware County, and Miss Christine Robinson, Emanuel County; Miss Camilla Weems was reelected consultant.

Other members of the association are: Miss Carrie B. Dixon, Burke; Miss Lottie O. Harris, Camden; Miss Beatrice Kelley, Crisp; Mrs. Weersie Smith, Columbia; Miss Lora B. Alexander, Dekalb; Miss Julia Terry, Dodge; Miss Alberta Holmes, Houston; Miss Seabie Russell Newton; Mrs. Lovie Lyles, Polk; Miss Inez Mack, Sumter; Miss Mardesque Powell, Thomas; and Miss Lula Pearl Lundy, Wash

Supervisors Inspect Improved Rural Housing Plan

S. P. Lyle, right, Extension specialist of the U. S. Department of Agriculture, shows three State supervisors of Extension home demonstration work simple cut-out plans for improved rural housing. Cut-out kits on rural housing are to be made available to all county agents shortly. Left to right are Mrs. Marian B. Paul of South Carolina, Mrs. Ruby F. Henton of Louisiana, Mrs. W. T. Merritt of North Carolina, and Mr. Lyle, who presented the demonstration at an Extension Service supervisors workshop held recently at Southern University, Baton Rouge, Louisiana.

World War II Veteran Grosses $7,000 From Poultry and Rabbit Farm

Washington, D. C.—Macon Wilson, a veteran of World War II, who lives near Hope, Arkansas, decided to try his hand at raising chickens and rabbits when he was discharged from the service a year ago. Already he has grossed nearly $7,000, according to a report received by the U. S. Department of Agriculture from the Arkansas State Extension Service.

The ex-GI started out during the fall of 1945 with 200 chickens and 50 rabbits, says H. C. Ray, Negro district Extension agent. He housed them in improvised shelters and raised them in time for the Christ-

Secretary Anderson Relates Major Agricultural Objectives Of Country

Secretary of Agriculture Clinton P. Anderson outlined the major agricultural objectives of this country as they relate to research needs in a talk recently before the 11-man advisory committee on the Research and Marketing Service Act.

The Act provides for the expenditure of 61,000,000 after 1950 for agricultural production, new uses, and marketing and service research. It is suggested that the South needs research primarily on

Now Is The Time For Extension Agents To Come To The Aid Of The Farmers

Washington, D. C.—"Now is the time—while building materials are scarce—for Extension agents and local leaders to help farmers plan improved housing," declared S. P. Lyle, Extension specialist of the U. S. Department of Agriculture, at a workship for Extension Service supervisors held recently at Southern University, Baton Rouge, La.

Mr. Lyle presented a demonstration showing how county agents may help farm people develop plans for building or remodeling their homes. Included in the demonstration was a skit built around the making of floor plans. For his plans be used cut-outs from a skit which the Department plans to make available to all county agents.

Mr. Lyle said that an effective program for improvement of rural housing involves the cooperation of the entire extension staff, both State and County. "Above all, the program must appeal to rural families as practical and must be one in which they participate in the development," he stated.

Continuing, he added, "Also, the program must provide for encouraging the full cooperation of builders and building supply dealers. And by interesting farm youths through 4-H clubs and schools to develop attitudes, knowledge, and skills, we may enlist their contribution to improvement of rural housing."

It has been pointed out that rural housing is one of the South's greatest needs. About four out of every five farm families in the South are ill-housed. Over half of

Letter On Agricultural Price Support Policy Made Public

UNITED STATES DEPARTMENT OF AGRICULTURE WASHINGTON

Nov. 26, 1946.
Hon. Elmer Thomas, Chairman
Committee on Agriculture and
Forestry United States Senate

Dear Senator:—The basic relationship between our agricultural price support commitments and production levels for the various crops involved is one of the most fundamental questions before us at this time. As you know, farmers have been promised price support at not less than 90 percent of parity on many important agricultural commodities for two full calendar years after the formal declaration of the end of hostilities. While this Congressional provision is very sound, giving farmers deserved protection during the transition from war-time to peace-time operations, it is obvious that under certain conditions, and for certain commodities, this support can serve to prevent the development of production patterns in line with peace-time needs.

While this situation will have more serious implications for the future, if domestic or foreign demand for the products of our farms falls off materially, it is also of immediate concern. We are having very real trouble with potatoes this year. In calling this whole question to your attention, I should like to review the potato program—in light of the difficulties we are having in carrying out price support commitments with this first of the major postwar "surplus" crops.

We had a surplus of potatoes even in 1943 and also in 1946. Potato production in 1945, for example, was 425 million bushels—then the third largest crop on record, despite the fact that harvested acreage was 200,000 acres less than the 1934 1943 average. Price support operations on the 1945 crop resulted in a net cost to the Government of about 20 million dollars.

With 1945 problems clearly in mind, we set 1946 potato production goals which called for materials reductions. When the potato price support program was announced later in the fall, levels were calculated on the low side of the possible price support range. We were trying to keep support prices from being an incentive to excessive production, but we were criticized rather severely for this action. As a matter of fact, in April the price support levels were increased by about 15 cents a hundred pounds, largely to compen-

No Millennium by Law

One grave fault with all "cradle-to-the-grave" security proposals is that they are based on the dubious principle of producing the millennium overnight. All you have to do, their hopeful proponents seem to reason, is to pass a law, toss in a few billion dollars of public money to pay the freight, and then sit back and watch the miracles occur.

The compulsory public health bill before Congress is an example of this kind of thinking. At a cost of from $4,000,000,000 to $6.000,000.000 a year, it would, in theory, produce wonderful improvements in the physical well-being of our people. But the plain fact is there is much more to public health than a law.

For example, public health is tied in with such problems as housing and nutrition, and the proposed bill does nothing about those problems. Improved public health also involves precentive medicine which will keep the individual from being attacked by disease, and the bill in question cannot speed medical experiment and progress. To the contrary, by regimenting the doctor the bill would undoubtedly hamper progress.

So far as availability of medical attention is concerned, which is what the bill covers, this country is already in an excellent position. The various voluntary, prepaid medical plans make first class attention available to most people if they so desire, and at a very low rate. And here, as in preventive medicine, orderly and rapid progress is being made. We are now solving what medical problems we still have without endangering our system of free medicine which is the best on earth.

Keep the Drums Rolling

The oil industry is a wholesome part of our economic system and helps uphold the American tradition of getting a job done efficiently and without fanfare.

During the war it was an industry with the ability to fully supply the needs of our country and many of our allies' for fuel and lubricants. This was one of the major feats that finally overwhelmed our enemies.

From the ports of the United States to the far corners of the world our ships delivered oil and more oil. Along the shores of New Guinea from Port Moresby to Sansapor, trucks wallowed their way over primitive roads with countless thousands of the familiar steel drums of fuel and lubricants. It was the same all over the world from Normandy to Iwo Jima and Okinawa. The soldiers despised handling these drums but they were thankful to see them keep rolling in for they knew their lives depended on oil.

The petroleum industry was producing 525.000 barrels of aviation gasoline every day at the war's end. The United Nations armed forces, excluding those of the Soviet Union, required 22,000,000,000 gallons of petroleum to conquer Germany. Oil was vital to the insatiable appetite of war. Without the ability of our oil industry to produce, the allied nations would still be fighting a war for survival.

Oil is a vivid example of an industry made up of hundreds of investor-owned enterprises. which could coordinate their energies to get a job done during an emergency. Petroleum is a progressive industry in which competition and cooperation reach a maximum in serving the public efficiently.

Morgan Farmer Praises Alfalfa

Alonzo Jackson, Talucah Community, Morgan County, Alabama, believes that alfalfa is one of the greatest grazing and hay crops that any farmer can grow. He has harvested four tons of hay from one acre this year.

Jackson selected his one acre plot for alfalfa early in 1945. He applied 12 wagon loads of barnyard manure and turned and harrowed the land. Later, he applied two tons of basic slag. The field was harrowed frequently during that summer. In late August he sowed 25 pounds of seed and obtained an excellent stand.

Jackson cut his first crop of hay in April of this year and made four additional cuttings throughout the summer.

The Minimum Wage

Dr. Paul Nystrom, who is professor of marketing at Columbia University, an authority on retail distribution. and a well-known economist, has written a great deal on the subject of inflation. In his opinion, one of the greatest dangers lies in the possible adoption by Congress of a program for substantially increasing the minimum wage.

Many people with an inadcquate understanding of the ramifications of the problems look favorably on higher minimum wages. These wage levels are, naturally, very low by comparison with the earnings of skilled labor. So. it is relatively easy to create a belief that people on the minimum wage level are being grossly underpaid.

The basic fallacy in this kind of reasoning is a lack of conception of the minimum wage's purpose. It is designed to assure the necessities of life, with none of the luxuries, for the least experienced, least competent worker. It is, therefore, simply a protection against starvation rates of pay. Wages above the minimum are the incentive offered for more work and greater responsibilities.

When the minimum wage is raised, even though only a few workers in any given concern may be immediately affected, a vicious cycle begins. The differential between the pay of the marginal worker and the more skilled worker lessens and may in some cases disappear. Then, inevitably, all other workers demand more pay, all the way up the line, and the inflationary spiral begins.

Minimum wages should be raised only to that extent made necessary by the higher cost of living. Once they are placed at semi-luxury levels, the purpose for which they originated is destroyed and one more long step toward unbridled inflation is taken. All law-making bodies must realize that.

What the People Have Given

In a recent editorial, the Portland Oreganian drove straight to the heart of the coal labor problem when it said:

"The labor bosses forget that what the people have given, they may also take away. The 'rights' to organize in unions, to bargain collectively, to strike and picket, have been confirmed by law. They are inherently just, for they represent the freedom of action to which an individual is entitled. But in their group application, such rights are subject to limitation and restraint. . . .

"The government, by successive grants of power to the organizers of labor, has itself become the victim of the abuse of this power. This feeble attempt to reassert its legal authority, after a series of abject retreats, is nauseating. The government which took the mines away from their owners so that Mr. Lewis' demands would be met, less than six months ago, has proved itself incompetent and powerless. Who may talk of nationalization of the coal mines as a remedy after this demonstration?

"The government had best get out of the mining business as fast as it can, and set itself the task of devising laws with teeth in them to guarantee the responsibility of workers and their leaders commensurate with the responsibility of employers."

Elsewhere the Oregonian observes that one effect of prolonged interruptions in coal production will be to force users to turn to other forms of energy—thus gradually reducing the demand for coal and the jobs the industry provides. The attitude of the mine union's leadership spells ruin and despair for the workers—as it spells depression and industrial stagnation for the nation. Labor must learn that no man, and no group of men, is greater than the people of the United States.

Letter on Agricultural

(Continued From Page 1)

sate for increases in the parity index.

Despite the downward adjustments in production goals and efforts to hold price supports at the lower levels, the situation in 1946 is much worse than it was in 1945. The Department is now engaged in price support operations of the largest scale yet experienced for this commodity.

Potato goals recommended by the Department for 1946, based on historical production figures and prospective demand, were expected to result in a production of approximately 378 million bushels. Instead, production soared, to 478 million bushels, giving us a surplus of between 90 and 100 million bushels.

While the total national acreage was only about one percent above the established goal, three factors contributed to the overproduction in 1946: (a) reductions in acreage in low yield areas, and increases in high yield areas; (b) ideal growing weather throughout the high yield areas: and (c) wider-spread use of the newly developed. more efficient insecticides such as DDT.

With this crop in prospect, the Department was committed to support potato prices, under provisions of the Steagall Amendment, at 90 percent of parity.

I want to report that the Department anticipated that the potato surpluses and that from the outset every effort was made to assist all branches of the distributive trades in moving potatoes through normal channels of distribution into human consumption. But despite comprehensive and consistent sales promotion efforts by both government and cooperating industry, the Department has been compelled to purchase or otherwise remove from regular trade channels approximately 40 million bushels of 1946 crop potatoes to carry out its price support obligations. Approximately 35 million bushels now under temporary or permanent loan, still remain for removal from ordinary trade channels.

The task of diverting the potatoes purchased by the Government has been attacked vigorously and continuously throughout the season. Here are the diversion outlets which the Department has exploited to the fullest extent feasible:

1. Direct Distribution—Approximately one million bushels of potatoes have been distributed directly to School Lunch Programs and to approved public institutions, free of charge. (Purchases started in May, only a month before schools closed for the summer, and schools reopening in September have not yet had a chance to absorb any appreciable amount.)

2. Diversion to Starch Mills and Livestock Feed—Despite continuing shortages of boxcars, potatoes have been shipped to every practical outlet. About 2,000,000 bushels have been diverted to starch mills. Another 1,500,000 bushels have been sold, most of them at 20 cents per hundredweight f. o. b., to farmers for use as livestock feed.

3. Diversion to Alcohol Manufacture—Distillers have taken 20,000,000 bushels for distillation of beverage alcohol—the largest of the diversion outlets. Shortages of grain this year for normal distilling operations opened this special outlet for surplus potatoes. An additional 6,100,000 bushels of potatoes have gone to distillers of industrial alcohol for ultimate use in the manufacture of synthetic rubber, antifreeze, and other products. With better grain supplies in 1947 and future years, the beverage alcohol outlet will not be available.

4. Export Outlets—A total of about 525,000 bushels.

The question immediately arises as to why potatoes were not exported in any appreciable volume. Early in the production season, the Department sent letters to all international agencies and foreign countries known to be in need of food supplies, calling attention to the very large United States potato supplies and offering to make them readily available. However, because of the high water content of fresh potatoes, shipping charges are relatively high per unit of net food value. They also require special handling. They might be protected from rotting in summer and from freezing in winter. Hence, it has not been possible to arrange large-volume shipments for export. So far potatoes have been exported only to Belgium, though the Department is continuing to follow up any possible opportunity to ship potatoes at the competitive world price not only on a government-to government basis, but even on a government basis, but even on a government to individual basis.

UNRRA and foreign governments have not been willing to purchase dehydrated potatoes at a cost of 25 to 50 cents a pound when they could purchase flour at five or six cents per pound. This held true even when the Department offered to supply the potatoes free of charge, except for the processing costs.

Since early May, we have geared our program to continuous and aggressive effort to utilize the potatoes which, under the mandate of the Steagall Amendment, we are compelled to support. In all sincerity, I cannot conceive of any practical step which we have overlooked.

But despite all our efforts, best current estimates are that there still may be as many as 20 million bushels of potatoes for which we shall be unable to find any practical outlet or use at all, and which are likely to be a total waste. These potatoes are now largely in temporary storage, the larger percentage of them in the northeastern section of the country. It has been necessary to leave many of the potatoes in the field, simply covered with straw or other material. The storage is not the type which will protect them from freezing this winter. Reports will soon begin to appear, telling how potatoes are rotting in the fields or going to waste in other places. This is an unpleasant situation, but it is a stark reality we must face.

The overall cost to the Government for the 1946 potato support program is estimated at 100 million dollars, leaving a net cost to 80 million dollars.

Remaining action with regard to the Government of approximately 1946 potatoes will center around continuing efforts to move every possible bushel into some useful diversion, thus holding costs and wastage to a minimum. The problems of the 1947 crop, however, are already squarely before us.

The approved production goal for 1947 is set at a figure which with the presently assumed yields, would produce a potato crop nearly 100 million bushels below this year's total. The national goal is now being broken down to county and farm levels within the States

Price support commitments under the Steagall Amendments are, of course, in effect for 1947. In an effort to avoid a repetition of the excessive costs and waste which have accompanied the very high 1946 production, the Department has announced that only those farmers who keep within allotted potato acreage goals will be eligible for price support under the 1947 price support program. While details of this support program have not yet been worked out, the proposal has resulted in a great deal of discussion among farm leaders. This is a good thing. All who are concerned with the interests of American agriculture should assist in reaching the soundest possible solution of the problems involved.

It is generally agreed in the Department that something of the nature of the proposed program is necessary if we are to cut tremendous costs to the Government and also eliminate the accompanying waste of food.

Because the problems we are already facing with regard to potatoes may arise for other commodities in the not far distant future, it is obviously imperative that the whole question of price support policy, to accomplish the underlying objectives of the legislation, be given prompt and thorough consideration. Leaders in the poultry industry, for example, have already expressed serious concern over the possible effect of existing price support legislation on orderly transitions within their industry. I therefore hope that a joint conference with the Senate and House agricultural committees can be arranged at an early date to consider this problem.

I am sending similar letters to the Chairman of the House Committee on Agriculture and the ranking minority members of both committees.

Sincerely yours,
(Sig.) Clinton P. Anderson, Sec.

On Behalf of the Consumer

An example of how aggressive retailers work to protect the pocketbooks of the consumer is found in the state of Oregon.

That state has a milk control law, whose main purpose is to assure the farmer a fair price for the milk he produces—and, as Oregon is an important dairy state, this purpose is almost universally approved. The law also provides, as a necessary corollary, that a state control board fix the minimum retail price of milk, basing prices upon the cost of bringing the product from farm to consumer.

However, the board seems to take the position, in interpreting the law, that the minimum retail price shall be largely determined by the most costly method of milk distribution—which is doorstep delivery. And there is where the controversy has arisen. The Safeway system, one of the nation's largest food chains, which has many outlets in Oregon, wishes to pass the savings made possible by cash-and-carry buying on to the customer. This saving amounts to 1 1-2 cents a quart. Safeway feels that the housewife who comes to the store for her milk and totes it home herself is entitled to the differential.

It appears now that the administrators of the milk control law may prevent this, and order stores to sell milk at the doorstep delivery price. So Safeway has been running a series of advertisements explaining its attempts to hold prices down. As one advertisement said, "We believe that cash-and-carry savings on milk should go to consumers just as it does on other foods. . . ."

This is a local issue—but it is indicative of how retailers throughout the nation, chain and independent, are trying to hold down the cost of living. It also points to the fact that the people must be constantly on the alert against laws and rulings which force stores to sell goods at higher-than-necessary prices.

Striking Against all the People

The Portland, Oregon, Journal came to the heart of the coal controversy when it observed that it was a quibble to say that the strike was directed against the government or the mine owners. Instead, said in Journal, "It was directed against the nation's factories and railroads, against the farmers, the storekeepers, the babies, against John Doe and Richard Roe and their neighbors along Main street in Tankville. The mine operators at one time made the lot of the miners pitiable indeed—but they have been brought into line and the government itself became the employer. Now the boss of the miners, holding the whip hand, is insisting upon the very principle against which he screamed at the employer—domination, coercion, oppression. Whatever the right-and-wrongs of the controversy itself may be, no man should have the power to defy his government, his president, and his fellowcountrymen."

The strike issue in all industry has gone far beyond the question of whether workmen are entitled to higher pay, shorter hours or other benefits. Those matters could be equitably decided and settled through the normal process of collective bargaining.

History repeats itself in curious ways. In the early years of this century, the excesses of a few capitalists led to the enactment of a long series of restrictive laws controlling business, beginning with the anti-trust statutes. Now the excesses of a few labor leaders are making it inevitable that Congress pass comparable legislation controlling the activities of the unions, for they have become greater monopolies in restraint of trade than ever did an industrial combination.

Early Chick Buying Urged by UT Expert

Do your chick shopping early. A. J. Chadwell, Extension poultry specialist of the U-T College of Agriculture, said today, in reminding poultry raisers that December is a good month in which to plan next year's operations. The three top items in Chadwell's "December Poultry Calendar" are:

Keep up egg production; shop for baby chicks, and build or repair brooder houses and brooders.

This is not all there is to December poultry work, but attending to these items will pay good dividends Chadwell pointed out. For more detailed pointers at this time of year, the specialists add these:

Keep the hens comfortable and contented; feed all the mash and grain the hens will eat; provide plenty of fresh water. A hen that does not have access to ground lifestone or oyster shells will use up the lime in her body, decline in egg production or stop laying entirely.

In shopping early for baby chicks, farmers should keep in mind their plan for the coming year, Chadwell said. The number of chicks to buy will depend upon the brooding equipment available, and the number of pullets wanted for the laying flock next fall.

February is probably the best month for the majority of flock owners to start baby chicks. However, some January hatched pullets will come in handy in the late summer and early fall when the supply of fresh eggs is on the decline.

Home Dry Cleaning Saves Money

Mrs. Julia Brooks of Prairie Community, Wilcox County, has done a splendid job of home dry cleaning.

During the spring she cleaned all of her family's winter clothing and saved around $8.00. Mrs. Brooks cleaned and pressed 15 rayon and woolen dresses, three skirts and three short coats, using cleaning fluid and dry-cleaner.

Mrs. Brooks started cleaning her own clothes in 1943 after she saw a dry cleaning demonstration given by the home demonstration agent. Since that time she has done all of her own cleaning, except for heavy coats and suits.

"You see," says Mrs. Brooks, "a dress coat costs 65 cents to be cleaned and pressed and a skirt 35 cents. I really don't know how I could keep my daughters' and my clothes clean if I couldn't do the work myself. So, I just get cleaning fluid by the gallons and a bottle of dry-cleaner. In a few hours I'll have clean clothes. I like the results and it certainly saves money."

Mrs. Brooks also sews. She can do anything from turning collars to upholstering furniture for neighbors and herself.

Something to Boast About

Mrs. Pool Evans boasts of the fact that she has eight cows milking and ten acres of alfalfa that are making things bright on her 80-acre Perry County farm which her son helps in operating.

Two and a half tons of superphosphate were put on the alfalfa last fall. It was well scratched into the soil with a section harrow. The cows grazed it for the first time this spring. Milk production increased one-half gallon per cow.

During the first week in June the alfalfa was cut and more than 12 tons of good quality hay were saved. Mrs. Evans plans to keep enough hay for her own use and sell the surplus during the winter months.

Gather Eggs Often for Better Quality

The quality of eggs will be improved during hot weather if they are gathered often and put in a cool place.

John E. Ivey, APL extension poultryman, advises that eggs be gathered at least twice—or better, three or four times a day during the summer. This practice keeps hens that use the nests later from warming the eggs over a long period of time.

Farm Talk With Farm Folk

By Jesse Safley

Have you ever before heard so much comment on rats, those worrisome little four-legged animals that cost the American people an estimated $63,000,000 annually through food actually consumed and wasted or made unfit for human or animal consumption? Is all this talk due to the fact that we have more rats on the farms and in the homes than ever before, or is it true that we have become more conscious of their danger and cost? No doubt, to a certain extent, it is both.

Few will question the fact that the rat population has been unusually large this year. On almost every farm where we have visited, some one has made a remark about the damage rats have done during the summer and fall or else we saw evidence of their presence.

The problem of rats is no longer a minor one and hasn't been for many years, yet there are too many people who take the presence of the pests for granted and do nothing to help reduce the ever increasing number.

You may be among the group of many who figure they have no rats or at the most not enough to bother with. A professor of the Iowa State College developed a plan for taking a rat census on the farm. In his proposal he said if rats are ever seen but there are signs of their presence, the number about the place is between one and 100. If rats are seen now and then at night the number will be between 100 and 500. When rats are seen every night and now and then during the day the number present might be as high as 1,000. If rats are seen frequently at night and also during the day the number will be far more than anyone would expect, sometimes running as high as several thousands. These numbers are large and might be hard for one to conceive if it were not for the fact that rats breed at about three to four months of age. Their gestation period is only 21 days and the litters range in size of about six to 20 with an average size of about nine. Young rats are weaned at about three weeks of age and the parent rats can breed every month of the year. Rats' "ripe old age" is about three years. If it were possible for all the young of a pair of rats to live and multiply that one pair might have more than 100,000,000 descendants at the end of a three-year period.

It may seem a bit stingy for one to complain about the small amount one rat eats, but there is much more to consider than the amount actually consumed. In the first place if you have one, you probably have many. One rat alone will consume about 50 pounds of grain or its equivalent each year and it is conservatively estimated that same animal will waste another 50 to 100 pounds. This plus the destruction it does to sacks, clothes, harness and baby chicks, multiplied by the number that is usually present, will definitely place the rat at the top of the expensive enemies of the farmer.

The control of rats is not an easy or simple process—mainly because they migrate from farm to farm and are able to exist on many types of food. They live and build their nests in places that offer protection from outside intruders. They generally feed after night fall which also contributes to difficult control.

The fact that so many people are careless in the disposal of garbage and in the storage of food and feeds is one reason rats are so numerous and hard to control. One farmer in a community trying to control the pests will never be able to rid his own farm if other farmers allow them to go without control. As soon as one group is eliminated—if the food is present, another group will move in. To be successful, this work must be carried out on a community-wide basis.

The month of November has been designated as rat control month. The idea is for all who are suffering losses because of rats—that means all of us—to increase our efforts to control them. A community might gain a few extra points in the Community Improvement Contest by making this one of their projects.

A rat control program in a community will not only involve a careful poisoning program but will necessitate the proper disposal of all garbage—and that doesn't mean to throw it a few hundred yards away from the house. All trash and rubbish piles must be cleared away Grain bins, potato houses, and all other places where food is stored must be made rat tight. Then and only then will a community be able to control the creatures.

We often hear farm people say we would have this or that if we could afford it. Chances are good that the amount these folks lose annually because of rats would buy those things. Think it over and then declare war on rats!

A hen that doesn't lay deserves no feed—cull her because the grain she and two of her sisters eat would provide enough cereal to feed a starving foreigner.

Oat Production Boosted After U-T Research

Three varieties of winter hardy oats have helped make oats so popular with farmers that it may be said they increased Tennessee farmers' gross income by at least $2,000,000 this year, officials of the Agricultural Experiment Stations, University of Tennessee, where the new varieties were developed, reported today.

Oat production reached an all-time high in Tennessee this year with an estimated crop of 4 1-2 million bushels, valued at more than $5,000,000. Prior to 1937, both the total acreage and the acreage harvested for grain were declining. From 1942 through 1936 the acreage decreased considerably, and the average yield per acre for the 12 years was 16 bushels.

In 1930 the Agricultural Experiment Station started a hunt for improved varieties of oats, with N. I. Hancock supervising the work. By 1936 the stations had introduced the Forkedeer, Fulwin, and Tennex varieties. Since 1937 oat acreages and per acre yields have climbed until the average per acre for the last 10 years has been 22 bushels The yield for this year is 25 bushels per acre, on a total of 180,000 acres.

The yield of Tennessee winter strains has often more than doubled the yield of spring oats. About 70 per cent of the planted oats is harvested for grain. Farmers have found that they can meet their feed grain needs in part by oats. This has enabled them to reduce their corn acreage and to produce feed grain more cheaply and with less labor. In addition, winter hardy oats provide a cover following corn, tobacco, etc.; they provide pasture in early spring; and good hay where the crop is not used for seed. Winter oats also make a good nurse crop for lespedeza and grasses.

Government by Edict

In a welter of strikes and other headline-claiming events we are in danger of forgetting one of the principal barriers to full production—the enormously swollen Federal bureaucracy.

Over a period of many years, we have become more and more a government of boards and bureaus. The war period greatly intensified the trend, as new administrative agencies were created almost daily to meet real or imagined problems. A few of these parasites on the body politic, such as the OPA, have just about passed into the limbo of forgotten things. But the vast majority of them remain—and their employes hang tenaciously onto their jobs—whether there is any need for them or not.

These agencies have a mania for issuing confused and often irreconciliable orders and directives and rulings. They are a constant thorn in the side of industries which are trying to get rid of red tape and return to the business of producing goods. On top of that, they are a gigantic and unnecessary expense to the taxpayer. They specialize in government by edict, and no one knows from one day to the next what the edict may be.

Clearing the government of the dead wood should be one of the first jobs of the next Congress.

Lighting Is Important Aid in Increasing Egg Production

By Kenneth B. McPherson

This is the season for farmers with poultry flocks to begin to want egg production to increase. Generally egg prices start to climb in the fall and continue at a "fairly" high level until spring. Early pullets are in off of the range with red combs and yellow shanks ready to settle down to the business of producing eggs.

Laying and lighting are companions in modern poultry management. There is no longer any question about lighting resulting in increased fall and winter production.

Lighting alone, however, will not produce eggs. It is by no means a mystical method of getting eggs out of a hen without any attention to feeding and housing. It is merely a very important aid. Without properly balanced rations of mash and scratch feed in the correct amounts, a hen will not have within her body the elements from which to make eggs—lights or no lights. Along with lighting and a balanced ration should go good housing in sanitary quarters.

In order to get the desired results there should be a sufficient amount of light in the laying house to cause the hens to stay off of the roost. It is recommended that 100 watt Mazda lamps be used, ten feet apart through the laying house and half way from the front edge of the dropping boards to the front of the house. The lamps should be high enough to shine on all the roosts so there will be no late sleepers in dark corners. The feed hoppers should be under the lights. Cone-shaped reflectors will add to appearance of the lighting installation and will help to concentrate the light on the floor area.

Many different routines for aptheplying lights have been proposed SoSme prefer evening light some morning light, and others a combination of them both. The time of lighting is very much a matter of personal preference and prejudice and of management in keeping with the system used. Where bright lights are used, the total number of hours of lighting (daylight plus lamps) should be about 14. Where morning lights are used, the lights can be turned on with a simple time switch or alarm clock operated tumbler switch, and turned off by hand. For night lighting where gradual dimming is necessary to get the birds on the roost, a more complicated wiring and control system is required.

Hens may be given 13 or 14 hrs. of light without a breaking-in period; but when discontinuing lights, the time should be shortened gradually to prevent throwing them into a moult.

It is important to have plenty of drinking water before the hens when they are scratching and feeding at night. In cold weather, inexpensive temperatures controlled electric water warmers will keep the water from freezing.

Electric wire sizes should be large enough so there will be no serious drop in voltage with consequent dimming of lights. If reflectors are used, they should be kept clean. Dirt on the lamps themselves may cut down the light intensity to such an extent, that the desired results will not be obtained. Clean them not less than once every week for best results and economy.

Spare-Time Bedspreads

Want something to do in your spare time?

In hers, Mrs. Berdia Melton of Perry County likes to make bedspreads from fertilizer sacks.

She uses eight sacks to make one spread. The sacks are washed, bleached, and dyed, and ironed before being used. The edges of each are fringed about one an a half inch, then sewed together. After adding the finishing touches to the spreads, they look like chenille bedspreads.

Mrs. Melton sells some of the spreads to friends and neighbors. Money received from them is used to make improvements in her home.

Better Pastures Surest, Best Feed Bill Curb

Improvement of pasture lands in Tennessee is one of the best and surest ways of cutting the state's food bill, Frank S. Chance, vice director of Tennessee Agricultural Experiment Stations, said today. The importance of a good pasture program is shown by the trend toward increased income from livestock and livestock products.

Whereas 70 per cent of the Tennessee farmer's income in 1924 came from crops and 30 per cent from livestock; in 1943 the percentage of income was 50 from livestock and 50 from crops. The general trend since that time has been toward a still greater income from livestock.

Work of the experiment stations has demonstrated that good production of livestock products can be obtained with forage and grass without a full feed of grain. At the West Tennessee station tests covering a period of years showed that dairy cattle in good, year-round pasture, with hay and some silage during the winter, did very well. They produced 92 per cent as much butterfat, and 88 per cent as much milk as was produced by cows under the same conditions with an additional grain ration. The cost of production on the pasture was appreciably less than the cost when grain was fed. At the same station, pigs were fed out on crimson clover during the dead of winter and even with the high cost of grain and supplements pork was produced at eight to nine cents per pound.

At the Knoxville station it was found that pastures for poultry greatly reduce the cost of egg production. At the Greenville station it was shown that steers, given good year-round grazing can be put on the market at some 28 months of age averaging around 1,100 pounds.

Pasture improvement requires attention to a number of things, including fertilization, seeding and management. The county agent can give help in development of a better pasture program.

Club Girl Masters Clothing Problems

Deep down in every girl's heart there should be two wishes—to make herself look pretty and to use her talents in some way.

At least this is the opinion of Naomi McKelvy, a 4-H club girl of Moulton Community, Lawrence County.

To prove that she likes to use her talents she made garments from feed sacks for herself during the summer. She embroidered pretty designs on dish towels and pillow cases and made kitchen curtains from scraps of materials. She also made blouses for her neighbors, which netted a little money.

Naomi is learning to make pajamas, weave a sweater, crochet and embroider Christmas gifts and make her school clothes after school hours. She hopes to take her mother's kitchen for a project along with her clothing project. Naomi has already made her curtains and during her spare time she plans to paint the cabinets and the walls. She wants to make the kitchen a sanitary and pleasant place in which to work.

She Keeps Busy

Although she lives alone and cultivates 20 acres of land, Mrs. Cynthia Davenport, Woodville Community, Randolph County, Ala., is a good homemaker. She is an active home demonstration member and a leader in her community.

From seed, fertilizer, flour and sugar sacks, this farm woman has made bedspreads, pillow cases, dish towels, pot holders, aprons, chair covers, scarfs, curtains, dresses, and underwear. She also has made a number of rugs from burlap bags.

As a club member, Mrs. Davenport has done project work in home improvement, and remodeled and painted her house.

This year she grew corn, cotton and a variety of vegetables. She canned 100 jars of food, dried 1-2 peck of apples, and stored enough Irish potatoes to last almost all the year.

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.

Giles A. Hubert ----------Editor
Sadie Wilson --------- Secretary
Henry Allen Boyd.---- Publisher
Office, 403 Charlotte Avenue.

Devoted to the interests of the Farmer, Truck Gardner, Livestock and Poultry, Breeder, the Home and the People.

Entered as Second Class Matter, April 10, 1929, at the Post Office at Nashville, Tenn., under act of March 3, 1879.

All contributions for publication in the Modern Farmer, should be addressed to The Modern Farmer, 403 Charlotte Avenue, Nashville 3, Tenn.

No libelous matter will be published. Unsigned articles or letters, and those written on both sides of the paper will not be used.

Subscription price $1.00 per year, 75c for six months, payable in advance. Personal checks must be certified. Make all checks or money orders payable to The Modern Farmer.

Advertising rates and sworn circulation figures presented upon application.

The Byrd Nest

(Continued From Page 1)

on a man, you can rest assured that he is not broken for service by the spirit of God. Certain words spoken to the ox will cause him to turn right or left; but you must have lines to guide a horse. The true Christian responds to commands but the unconverted needs bits in his mouth.

The ox can work well only with another ox. God directed the Israelites never to plow with an ox and an ass together. Because of the difference in their nature, their mode of work, natural tendencies, and understandings of commands, to hitch two together would bring destruction to portions of the crop. Experience in trying to work oxen Christians and Jack-ass church-members together, has taught the writer that it is always best to hitch together, two of a kind. The ox, when pulling a heavy load up a hill will not give up even if it is necessary for him to fall on his knees and moan until he regains strength. So often, the Christian under burdens has done the same. He serves when it is hard, and holds on even when things are heavy.

World War II.

(Continued From Page 1)

mas market. They brought a fair margin of profit. This encouraged him to increase his flock and add more rabbits. With the aid of his county agent, the veteran planned and built a large poultry house, a brooder house and a score of rabbit pens.

This fall, by the time that he had been home a year he had sold over 4,000 chickens and nearly 1,000 rabbits. His fryers brought him about a dollar each and his rabbits $1.50 plus $1.75 for the hides when he cured them properly. He raises 1,000 chickens and 250 rabbits at a time.

District Agent Ray says that although Mr. and Mrs. Wilson's farm contains only 10 acres, they are making it yield a good living. They have a comfortable home with electricity and running water.. Next year they plan to increase their income by growing more of the feed for rabbits and chickens.

Secretary Anderson Relates

(Continued From Page 1)

cotton, peanuts, soybeans, and tobacco. It is pointed out that about 12 million Americans, mostly southerners depend largely on cotton for a livelihood.

In discussing the needs for agricultural research, Secretary Anderson listed six major agricultural objectives:

1. Adequate and Efficient Farm and Forest Production—U. S. farmers should produce the kinds and quantities of food necessary to provide every person of taste and preference. They should produce enough, in addition, to meet economic export demands. Production of fibers, forest products, and other non food agricultural products should be similarly geared to domestic requirements and foreign demands. Resources and manpower should be used to produce the great est continuing value of products that they are capable of producing, and not wasted in production of kinds or quantities of commodities that are not wanted ----- If there is unemployment, national economic policy should prevent agriculture from becoming the dumping ground for industrial unemployed.

2. Conservation of Farm, Range, and Forest Land—Agricultural lands should be put to their most efficient use on a long-range basis ------A stable rural culture cannot be maintained on eroded and impoverished land.

3. Efficient Distribution of Farm Products—Nearly one half of every dollar that consumers are now spending for food and about nine tenths of every dollar spent for cotton and tobacco products go to the people who store it, process it, sell it and move it to market——— Technological improvements in marketing and transportation should help us to reduce costs and increase market outlets for farm products, both at home and abroad.

4. Parity of Prices and Income for Farmers—Farm families generally should receive prices or returns that will yield them enough income from farming to maintain a level of living equivalent to that of persons in other occupations with comparable skill, effort and investment. This does not mean that the Nation should support in agriculture everyone who may choose to live on a farm. It does mean a national obligation to give farm families their fair share of national prosperity and to prevent their bearing more than proportionate share of such depression as we may not be able to avoid.

5. Parity of Services and Facilities for Rural People—Parity prices and parity incomes are not ends in themselves so much as means to the greater objectives of a parity of living conditions between rural and urban people. Fair prices and incomes will help farm peole to achieve a parity of schools, roads, housing, rural electrification, health services, and recreational and cultural facilities.

6. Good Tenure Conditions, with Special Emphasis on the Family Farm—All reasonable encouragement should be given to development and preservation of family farms that are efficiently operated and capable of yielding a satisfactory level of living.

Mow Pasture Weeds for Better Grazing

Keeping down weeds and bushes in the pasture pays off in more and better grazing for livestock.

With the increased amounts of fertilizers used on pastures, harmful plants grow faster, using more of the moisture and food needed by the grasses and clovers. The quality of grazing is lowered by weeds and bushes.

Mowing should be done often enough to control weeds and stop their reseeding, says J. C. Lowery, APL extension agronomist. Once the seed supply of annual weeds is destroyed, volunteer crops become smaller and easier to control.

Georgia Home Demonstration

(Continued From Page 1)

ington County.

The constitution and by laws were read for the benefit of the New members after which some of the aims and objectives of the association were outlined. Miss Camilla Weems, our consultant, gave a very inspiring and informative talk on 'What it means to be a real leader." The meeting closed with the members saying that they are determined to do a better and bigger job of trying to reach and inspire a much larger number of farm families and other families in 1947 and to inspire more people to become leaders and help our people to improve their standards of living.

The Georgia Home Demonstration Agents' Association is now three years old, having been organized in 1944 and the members wish other states to know that we too are organized and at work.

Some of our objectives are: A more unified extension organization; more human interest in associates; a better uderstanding of associates and a more sympathetic consideration of them; a more dignified and cultured group of extension agents by means of an outlined course of reading and formal study for advanced degrees whenever possible.

West Indies Workers Help Produce Sugar Here

Nearly 4,000 West Indies agricultural workers—mainly Jamaicans and Barbadians—are helping with the sugar-cane harvest in Florida and Louisiana, the Labor Branch of the U. S. Department of Agriculture reports.

About 3,000 Jamaicans and Barbadians are employed in Florida, ad 1,200 Jamaicans are in the Louisiana cane fields. Describing the Florida harvest, one Jamaican writes:

"Cane knives are swinging and caterpillar treaded wagon trains are clanking across the mucklands here in a new symphony of swee music for a sugar hungry world."

Pointing to the over-all contribution of the West Indies workers, the writer continues: "The annual harvest of 30,000 acres here on the plantations of the United States Sugar Corporation is starting. when it ends in May the estimated contribution to the Nation's sugar supply will approach 200 million pounds—enough to supply every ration-book holder in the United States with a 30-day quota."

Mr. Herbert G. MacDonald, chief liason officer of the British West Indies Central Labor Organization, spent five days in Louisiana during November visiting Jamaican sugar-cane workers there. He reports that the workers are doing splendidly.

Mr. Macdonald, also reports that heavy repatriation of West Indies workers is about over. The workers still in this country will remain here throughout the winter, he says.

Farmers Asked to Aid Iron, Steel Scrap Drive

The nation's farmers have been called upon to comb their farms for the iron and steel scrap needed to keep the country's steel furnaces at capacity operation, the Department of Agriculture announced today. The appeal to the farmers was to answer to a request of Civilian Production Administrator, J. D. Small who said steel production might drop considerably from the present 90 per cent of capacity rate unless more scrap is available.

Scrap is formally used in equal amounts with pig iron to supply most of the country's normal production of $1,000,000 tons steel ingots.

Now Is the Time

(Continued From Page 1)

these live in homes that are beyond repair. Among the homes that are not below standard in the South, 38.8 percent are in need of major repairs, 23.8 percent are over crowded, only 4.9 percent of them have flush toilets, and 15 percent have no toilets at all.

Mr. Lyle told the supervisors that improved housing would advance the health, happiness, and general effectiveness of millions of farm people. And he called on them to intensify their rural housing program.

The Extension specialist pointed out that the cut-out kits which are to be made available to county agents will help them aid farm families more effectively in developing plans for the type of home they may want. Special emphasis will be placed on sufficient number of bedrooms, and adequate closet and storage space in the kit material. These kits also will aid agents in stimulating farm people to improve their homes, he said.

Already in most states, the county agent serves as a source of information regarding housing plans, builders, and building supplies. In some counties, the Extension agents have helped the rural people to set up committees to study their housing needs and suggests ways of meeting them. Also, these committeees aid veterans in finding farms and farm homes to rent or buy.

Home agents work very closely with home makers in helping them to remodel or redecorate their homes. They suggest selections of wall paper, colors of paint, selections of curtains, and arrangements of kitchen facilities in the most convenient pattern.

Mr. Lyle said that during this period when building materials are scarce is a good time to carry out an effective education program on rural housing to help promote the building of improved homes designed functionally to meet the special needs of farm people when materials become more plentiful.

Efficient Farm Methods Needed to Offset Costs

More efficient farming methods must be used to keep up a fair margin of profit in the years ahead, extension economists of the U-T College of Agriculture, said today

Farm wage rates rose faster during war years than the prices of farm products, economists pointed out. One-third more products were required to pay for an hour of hired farm labor in 1945 than was required in 1941. Prices of services and goods farmers must have are high and many of these costs are still rising. Goods of services which depend mostly upon the cost of labor are expected to continue rising in price for some months; nor are they likely to fall much except as the efficiency of labor improves, or wage and salary rates fall. Wage and salary rates are not expected to fall much until there is considerable unemployment.

The cost of operating the average farm is now nearly twice as high as it was in 1941. If and when considerable unemployment develops, prices of farm products are likely to fall faster and further than the costs of operating a farm.

Due to increased mechanization and improved efficiency, farmers produced during war years from a fourth to a third more than ever before with 10 per cent less than the normal farm labor supply. This trend in greater production per worker is likely to continue, economists said, depending upon the extent of mechanization and use of efficient farming methods. The outlook for the years ahead is more optimistic for the farmer who can keep abreast of this trend.

Haiti Now Shipping Cut Flowers to U. S.

Sweet peas gathered in Haiti late one afternoon recently and loaded on a cargo plane at seven that evening, arrived in New York, some 1500 miles away, early the next morning—fresh, fragrant and ready for market. Other cut garden flowers, such as delphinium, babys breath and scabiosa, also are being raised in Haiti this winter for air shipment to New York and Washington. D. C.

This is one of the newest inter-American agricultural business ventures, according to the Office of Foreign Agricultural Relations of the U. S. Department of Agriculture. The flowers will be grown and shipped only during the winter season when they are not grown outdoors in the United States. Some are greenhouse grown in winter in this country. but the supply is much below the demand.

The flowers are fumigated as they come in from fields so that they will not bring in new insect pests or plant diseases. At the port of entry in this country they are checked by Federal Plant inspectors.

These are some of the first outdoor garden flowers to come to market from the Tropics. Heretofore, only expensive blooms like orchids and gardenias have been shipped such distances by air.

Don't Take Away the Porch

Modernization of rural housing is carried too far when it fails to provide front and rear porches, says Mrs. Alice C. Oliver, Negro State Extension home demonstration agent of Mississippi.

"Daughter's courting is cramped, home laundering is a threat to health, and home-canning is an extremely unpleasant chore when the architect denies the rural family their airy porches to which they have become accustomed through the years," declares Mrs. Oliver.

The state home agent has asked the Mississippi State Extension Service to suggest to rural home builders that porches be included in their designs. She says that the climate is such in Mississippi that families can make excellent use of the porches eight months of the year.

Recommended Farm Practices Used by Hale County Farmer

Seven improved farm practices have been adopted by Cornealis Burroughs, Bay Spring Community, Hale County. They are: (1) soil improvement crops; (2) grazing crops; (3) soil management; (4) permanent pasture; (5) improvement of livestock by the use of purebred males; (6) proper use of commercial fertilizer; and (7) selective cutting of timber lands.

Burrougs diversifies his crops as follows; Ten acres permanent pasture, two acres kudzu, two acres sericea for hay and grazing, and six acres of vetch for soil improvement. This year he also is planting two acres of blue lupine for soil building. His 1 1-2 acres of grain sorghum, twelve acres of corn and four acres of peavine and sorghum hay are used as feed.

Cash include on Burroughs' farm comes from 2 1-2 acres cotton, six head of dairy cows from which he sells butter and grade calves, pigs from two brood sows, 1 1-2 acres of vegetables for market, eggs, and broilers from forty laying hens, syrup from ribbon cane, and timber from five acres in wood land.

In addition to products used at home, Burroughs' cash net income was $1,327 last year. He is planting three acres of vetch this fall to be turned under next spring and fallowed for starting a two acre demonstration in alfalfa and one acre in Manganese bur clover.

Turn Garden Soil Now to Be Rid of Insect Pests

By Dr. Floyd Brailliar
Garden Editor of the Nashville, Tennessean

Before calling it quits for the year in the garden, the gardner will do well to do all he can to get rid of next year's insects. Fall is the best time usually to turn your garden soil over—for two reasons, First, garden soil should be thoroughly well-aerated once a year and this is the best time to do it. First because in doing this, we have an opportunity to take up the winter quarters of many insects that burrow into the ground to spend the winter. Most of these insects spend the winter in the larvae stage of their existence in a little room that they have burrowed out and water proofed by plastering the walls with a waterproof cement which they themselves secrete. In this way they are not injured by moisture during the winter. If this room is broken so that the moisture gets to their bodies they soon die for it is physically impossible for them to prepare such a room a second time.

Turn Fertilizer Under

Garden refuse as well as stable manure and other organic fertilizing material can be turned under and allowed to decay in the ground. It is well to leave the surface of the soil rough after breaking it up and turning under this material but it does pay especially in the South to sow rye on the surface of this soil just as soon as it has been turned under. Rye will cover up even when the weather is decidedly cool and prevents much washing and leaching.

For the North a better method is to pull old plants up, rake them off and put them in the compost pile, before turning the soil. This is because very little decay will take place in soil that is frozen hard for weeks at a time and so the soil will take care of most over-wintering diseases and insects, and will furnish valuable organic matter for next year's garden.

Not Hillside Gardens

What we have said about turning over the soil late in the fall does not apply to the hillside garden, however, unless it is done early enough for the rye to become well established before the ground is frozen. This is because it is best not to leave the soil loose and mellow because of danger of its washing off. Of course this can be prevented by a cover crop or even by a good heavy application of stable manure spread on the ground after the ground has been broken and not turned under. On level surfaces in the north the cover crop is not absolutely necessary though even here it is a great advantage. If the soil needs liming the best time for this lime to be spread is just before or just after the organic matter is spread and ready to be turned under. Commercial fertilizers should not be put on at this time however. These soluble materials will be lost by leaching during the winter, and so we have very little if any value by springtime. These commercial fertilizers will not permanently improve your soil to any considerable extent. In fact, they are not intended to do so. They are used simply to increase the yield of the particular crop on which they are used.

Use of Sawdust

While we are discussing the permanent improvement of the soil and getting rid of insect pests for the year, we may still emphasize the value of sawdust both as a fertilizer and a mulch not only for hardy shrubs but for perennials as well. We are frequently told by city and small town dwellers that they do not see any way to build up the humus content of their soil, simply because it is almost impossible to get stable manure. There is no better material to mix with the soil to decay and provide humus as well as fertilizer than a reasonable amount of sawdust. Formerly there was a prejudice against using sawdust as a fertilizer lest in decaying it might sour the soil and it might become a breeding place for worms. In order to test this, one of our state agricultural experiment stations recently reported on the results of a 20-year test to determine whether these things were true. In this test they used sawdust freely both as a mulch and as a fertilizer and found no appreciable increase in either the acidity of the soil or the number of injurious worms in the soil.

Farm Talk With Farm Folk

By Jesse Safley

After a few mornings of cool, frosty weather like the kind we have had during the past week, that annual event of killing hogs is not far off—at least, not for the ones who have hogs to kill. In the opinion of many that number is considerably less this year, however, we believe that more farm families have their winter pork supply than many think. We'll agree farmers have quit bragging about the number of porkers they have to kill or the number of hams they have left from last year, which is a very smart move on their part one they should continue to practice. There are just too many friends, neighbors, and yes, relatives who are without who could have the same thing if they wanted it bad enough to work for it, but they don't.

Regardless of whether there is more or fewer animals to be slaughtered and cured on the farm this year the answer after it is cured will be about the same. Many pounds of what might have been good ham or bacon will be practically inedible because of improper slaughtering and curing.

Tennessee is known throughout the nation for its "country ham" which is one of the few finished products from the farm and truly one of the most delightful foods one can buy, that is when it is properly slaughtered and cured. A bad thing about home slaughtering is that many pounds are lost annually due to spoliage, and still more is practically inedible from oversalting or other causes.

We have been asked by a number of farmers and other people how the job should be done or how they might have better cured meat. They attempt to provide their family with an adequate supply of pork but find, after it is too late, that the hams and shoulders are too salty, the bacon becomes rancid, and they become disgusted.

To produce desirable cured meat is not a hard job. Almost anyone should be able to do it but there are a number of simple practices that should be followed. We are led to believe that the "curing" of the meat is the essential step, which is true, but it should be considered as only one of the essential steps. The production of desirable cured meat begins even before the animal is killed.

Hogs which have been grown rapidly will provide a better quality of pork than those which have made slow gains. Animals that are intended for slaughter should be kept off of feed for several hours and provided with plenty of water during this period. This will allow them to bleed more freely when stuck. Complete bleeding is essential to good meat. When blood is left in the meat it will not take curing as readily.

Scalding and cleaning the carcass is very important and should be done with care but this process will not add to or take from the value of the finished product as long as all of the hair is removed.

Water at a temperature of 145 degrees to 165 degrees will do the job but the carcass should be moved about in the water during the scalding process. By all means the carcass should be perfectly clean when cutting and trimming begins.

Proper cooling of the pork immediately after it is cleansed is very important. The most desirable temperature between 32 and 40 degrees. When the temperature is above 40 degrees it will not successfully cool and if it is below freezing the outside of the meat freezes, opening the animal heat around the bone. This often contributes to meat spoilage because many farmers kill hogs only when the ice is an inch or more thick which means the meat will freeze before it is put into cure.

There are many methods employed in home meat curing. One of the oldest and probably the most common practice still followed is meat with salt. The hams, shoulders, sides and all are placed in a bed of salt and completely covered. Some of the best ham we have ever tasted was cured by this method; however. one cannot always depend on a successful cure this way, and it is seldom the bacon is desirable after remaining in the salt as long as the hams. When we say desirable, we mean for breakfast bacon purposes and as for "cooking" or "boiling" meat, as it is often referred to. there is none better—provided it hasn't had time to become rancid. Too often the hams and shoulders, as well as the bacon, are made undesirable, from oversalting.

Another method commonly used and one recommended by the University of Tennessee College of Agriculture is the sugar cure method. Don't ask us where to get the sugar. We don't know! Just in case you might be able to obtain the necessary amount of sugar which isn't much, here is the recommended recipe: For each 100 pounds of ham and shoulder, use eight pounds of salt, two pounds of sugar and two ounces of saltpeter. The ingredients should be carefully mixed and divided into three equal parts. One part should be applied to the meat soon after it is cooled by rubbing it into the meat. The meat should be packed in a box, skin down. On the third day the second part of the mixture should be applied and on the seventh day the third part. The meat should be allowed to stay in the mixture for at least 25 days. if the pieces are large, a day and a half should be allowed for each pound. Allowance should be made for extremely cool days. Remaining mixture should be brushed off and the meat soaked in cold water before hanging it to smoke.

For curing bacon four pounds of salt with two pounds of sugar and four ounces of saltpetre should be applied at the same time. Twelve to 14 days is long enough for the bacon to stay in the salt. It should also be soaked and hung to dry.

We will realize there are those who won't trust this method especially if they are accustomed to the other method mentioned because they will feel that the amount of salt is insufficient. It will do the job. However, if you always get favorable results from the other method we would be the last to suggest a change. If you are not satisfied, if your meat is usually too salty or becomes rancid early in the spring, why not give this method a trial.

Perhaps you have a method of your own that is entirely satisfactory and one that would mean much to others. If you do and care to let us know about it we'll attempt to pass it on. As we said at the outset, too many pounds of good ham, and bacon are lost annually by improper treatment. You can't afford to lose it this year!

For Two Cents!

The American investor, who provides the tools that make possible all production and employment in this country, works for a modest wage. That is the story told in a recent advertisement by the New York Stock Exchange.

"'For two cents,' the advertisement reads,' . . . I'd invest my surplus funds in securities . . . and share in the ownership, the risks and the rewards of American industry.'

"This may not be precisely what the investor says, or even thinks . . . but it ish what he does!

"For slightly less than two cents out of the corporate income dollar (U. S. Department of Commerce figures for 1945), the American investor provides industry with the funds needed to create jobs and produce goods.

"The ability of industry to obtain funds on such a basis is a striking indication of our people's faith in business efficiency . . . of their confidence in the future of our business enterprise."

The backbone of American industry is the man with some money to invest who is willing to take a chance on American enterprise, American labor. American productive genius. Out of that spirit comes our world economic preeminence. The investor, earning his two cents on the dollar, is worthy of his hire.

Plan to plant plenty of winter legumes and small grains.

Sloped Farrowing House Floors Add to Pork Supplies

Sloping floors in farrowing houses have greatly reduced the death rate of pigs from crushing by the sow, according to records kept on many farms. For example, records on 385 litters in a neighboring state show that sloping floors reduced the death rate from one pig in four to one in 30.

Saving more pigs from being crushed is the quickest and cheapest way of increasing the pork supply. Extension animal husbandman of the U T College of Agriculture have advised. Farmers building new farrowing houses are urged by swine specialists to build in sloped floors. But practically the same result can be obtained in old farrowing houses by blocking them up in front to provide an elevation of about an inch and a half per foot. Or, on rolling land, the house can be set on a hillside to give the right slope.

Complete details for building or locating farrowing houses are given in Extension Leaflet 82. "Sloping Floors Save New-Born Pigs." Copies of the leaflet, and helpful suggestions, can be obtained from county agents.

A Creed for the Discouraged

I believe that God created me to be happy, to enjoy the blessings of life, to be useful to my fellow-beings, and an honor to my country.

I believe that the trials which beset me today are but the fiery tests by which my character is strengthened, ennobled and made worthy to enjoy the higher things of life, which I believe are in store for me.

I believe that my soul is too grand to be crushed by defeat; I will rise above it.

I believe that I am the architect of my own fate; Therefore,

I will be master of circumstances and surroundings not their slave.

I will not yield to discouragement, I will trample them under foot and make them serve as steppingstones to success. I will conquer my obstacles and turn them into opportunities.

My failures of today will help to guide me on to victory on the morrow.

The morrow will bring new strength, new hopes, new opportunities, and new beginnings. I will be ready to meet it with a brave heart, a calm mind and an undaunted spirit.

In all things I will do my best, and leave the rest to the Infinite.

I will not waste my mental energies by useless worry. I will learn to dominate my restless thoughts and look on the bright side of things.

I will face the world bravely, I will not be a coward. For I am immortal, and nothing can overcome me.

Virginia Opla Myers.

Lee County Farmer Profits from Woods

Jack Jones, Lee County, Ala., farmer, has found that selective marking of his timber has doubled the price it brings.

Timber on his farm, which he thought at first would bring $300 to $400 brought him double that amount when he followed the advice of John B. Graves, extension timber marketing specialist in this section of the staate. A total of 80,000 board feet of matured timber was marked selectively and sold.

Jones cuts no pine for home use. He found that he can use maple for stovewood and save his pine for sale. With a short crop last year, he paid all his cash on his place and turned to his woodland for necessary spending money. He and his boys are digging fat pine stumps and working them into neat kindling bundles. These are sold in large quantities for 4c per bundle or on a house-to house basis at 5c per bundle.

Under the care given his woodland, his pines are healthy and making rapid growth. Jones says that the combination of hard work and good management for woodland practically assures a successful farm forestry program.

Sheep in the Meadow

By Jasper B. Sinclair

Biblical teachings remind us that next to the planting of grains and cereals, sheep raising is one of the oldest pastoral pursuits. So it is not surprising that our wooly friends have had their full share of literary recognition since ancient times.

The Bible itself contains many allusions of the sort. It tells us that the "Lord tempers the wind to the shorn lamb," while it also made "the black sheep" a familiar, if not desirable descriptive phrase.

Robert Louis Stevenson made frequent mention of the sheep that grazed his native Pentland hills. For that matter, he learned much about his country's legends and traditions from John Tod, the "Swanston Shepherd."

Virgil, the great Latin poet, wrote about sheep in his four-volumed poem, "The Art of Husbandry," and in his collection of pastorals called "Eclogues." So did Theocritus, after whose poetry Virgil modeled much of his own verse.

In our own literature Whittier, Bryant, and Whitman are among the American poets who have paid tribute to sheep. Much more has been written between their time and the days when shepherds watched their flocks beside the hill of Calvary.

Sheep scamper merrily in and out of nursery rhymes, jingles and children's games. Perhaps you can still remember back to the days when youngsters played and chanted their "Run, sheep, run!"

You are more certain to remember that "The Sheep's in the meadow, the cow's in the corn." Also that "Little Bo Peep has lost her sheep," which was a rather careless example" for Bo Peep to set the children of the world.

They also wrote their share of history, especially in the colonizing and building of an industry in Australia. It is just a little more than 100 years since seafaring Captain John MacArthur landed in Australia with five Spanish Merino sheep.

Those five sheep were the ancestors of flocks that now number more than 130 million sheep in the land of the the Southern Cross. A few years ago Australia marked the centenary of MacArthur's landing with a commemorative postage stamp. It was one of the earliest postal tributes to our wool-bearing friends.

The Role of the Merchant

Authorities on retailing have observed that a very considerable segment of the American population has little understanding of what retail merchants have done to limit price increases—and have a misconception of the merchant's role in the distribution machine. The fact that such activities as "buyers' strikes" are usually directed at the merchant, is one proof of this.

The attitude of merchants toward the public was well demonstrated in the early days of the war, before ironclad OPA controls were imposed, Stores were simply requested to hold the price line, in spite of shortages, increasing demand and the decline in normal competitive measures. The vast majority of stores, chain and independent alike. complied, and price boosts were limited to the absolute minimum.

Since the virtual demise of OPA, the stores have been in an exceedingly difficult position. Heavy and inevitable price increases occurred in most manufactured and agricultural products—the result of higher wages, material costs, etc. The merchant has had no choice—he has to raise his prices if he is to survive. But it should be known that most stores have voluntarily adopted the policy of limiting these increases as much as possible. In many cases they have reduced their narrow margin of profit in order to protect the consumer's dollar, to the best of their ability.

The store, like any business, cannot escape the economic conditions of the times.

A woman's promise to be on time carries a lot of wait.—Reader's Digest.

Old Farmer's Almanac Says: 1947 Second Cold Year in Row—and He Knows

By Frederick C. Othman

Washington, Dec. 16—(IP)— Unflap your earmuffs, friends, and put your mittens on the shelf behind the stove so we can open the yellow cover of the old farmer's almanac. Pile on some more wood.

"This," says the old farmer, "will be a real, old-fashioned winter with plenty of snow and cold weather—the kind that grandpa knew when he was a boy."

The old farmer knows. He predicted snow for July 13, 1803. It did SNOW.

For 155 years now the almanac has been issuing the gospel truth about the tides, the phases of the moon, how to keep from burning down the barn, when to catch a mess of hornpout, and the date for battening down the storm cellar door. Publisher Robb Sagendorph writes from Dublin, N. H., that there's been nary a complaint in all that time. So if the ice has melted from your whiskers, let us gaze upon 1947:

JANUARY: Stormy, raw winds, slippery going, rain, snow, fog and sleet, As you will want your workshop stove heated in these bitter months it is best to have it in a separate building pretty well away from your hay barns.

FEBRUARY: Falling weather. Set hens 21st to 28th. Still wintry. More comfortable indoors. Ever try raising squab? A sure market there with the summer people.

MARCH: Stormy. High winds. Altogether unpleasant until 25th. A few mild days. High time now to get your feet out of the oven. Mend everything that isn't junk and save the junk.

APRIL: Pleasant. Then changes to lowery and dank. On the 11th, cold, easterly storm with snow. A hive of bees to every acre of orchard is ample. Do not depend on wild honey bees, and bumble bees for polination.

MAY: Mackerel skies may hold rain until 5th. Windy and disagreeable. May shower on 19th. rainy days—29th. Nature feeds the poor farmer with her half truths, her false promises, her juggling oracles. About now he's looking for late frosts. He can forget his worries with his fishing pole. A good mess of hornpout fried crisp beats the sleekest trout.

JUNE: Cooler, May hail, 10th. Now much warmer, 20th. Good growing weather. Real warm. His night wandering cattle punch through the idle fences of the careless farmer to munch his neighbor's garden. Better no fence than a poor one.

JULY: Cold and rain. Scorching sun 8th. Sultry on 21st and moist on 28th. There's still the old swimming hole.

AUGUST: Showers. Dry spell 9th, on the 20th rains hard. Much cooler. Saw your cordwood now and get it under cover.

SEPTEMBER: Storms. Frost in places. 16th. Bad storms due 23rd. Sow fields before 20th. Don't miss the county fair.

OCTOBER: Good fall days. Heavy rains, 9th, Brisk. Cold, Snappy. This is a good month to set out trees, either fruit or shade. First killing frost 24th.

NOVEMBER: Cold and stormy, might snow. Good spell, 17th through 20th. Chilly.— Rains or snows. The hunter's moon. Prune your grapevines.

DECEMBER: Unfavorable. Clouds denote snow, 6th. Milder now, but better pull the rug to the crack of the door. Fine between dull days. Christmas, snowy. The cold reddens our cheeks and waters our eyes. And so to the new year.

And as the publisher adds, the second cold year in a row good mostly for muskrats. Thickens their fur.

Ewe Specializes in Twins

Chilton, Wis.—(IP)—Meat may be scarce in the markets, but a Shropshire sheep owned by Milton Hemauer of this community, is trying hard to right the situation. The energetic ewe has given birth to two sets of twin lambs since January.

Farm Price Supports Likely Through 1949

Washington—(AP)—An extra year of government price support operations—possibly worth more than a billion dollars to American farmers—appeared definitely in prospect yesterday. Unless the war's end is made official before January 1, the price supports run at least through 1949.

If the government declares the war at an end it moves forward the time when it quits guaranteeing farm prices—to the end of 1948 if the proclamation comes in the next 24 days. But at the same time it signals the end of powers like the Smith-Connally Act for dealing with such crises as the coal strike, and the draft act for filling occupation army ranks. Those are only two of many factors

Agriculture department officials say that with war powers still in constant use, they do not expect such a proclamation this year. It would cut most of those powers off in six months.

A law passed early in the war requires the agriculture department to support prices of most farm products at not less than 90 per cent of parity for a two-year period beginning with the first day of January immediately following the date upon which the President proclaims official end of the war.

With farm prices showing weakening tendencies in recent weeks, the prospect of an extra year of price supports is of special significance to farmers. Official reports indicate that despite advances in prices of most animals since price controls were removed, the general level of farm prices has declined nearly five per cent during the past six weeks.

Nevertheless, the farm price level is more than 20 per cent above the parity level. Parity prices are theoritical standards set up by law for measuring actual prices. At parity levels, prices are declared to be equally fair to producers and consumers.

Thus, farm prices have a long way to fall before they drop to the parity level and even farther before they reach the 90 per cent parity level at which the government is required to halt their decline.

Many farm leaders and officials look upon recent farm prices declines as healthy adjustments which should broaden consumers buying and which should tend to discourage farmers from producing excessively next year.

On the other hand, farm officials except agricultural surpluses to develop within a couple of years which would depress prices. It is because of this prospect that an extra year of price supporting operations might be worth big money to growers.

Is This Old-Fashioned?

Nowaday, when someone speaks of flood control, we have become conditioned to thinking of an enormous Federal undertaking, costing tens of hundreds of millions of the taxpayers' dollar, staffed with armies of "workers," and involving, as a sort of by-product, one or more Federal hydroelectric projects designed to take the power business out of self-supporting, state-regulated enterprises and to turn it over to the bureaucrats and the social planners.

There is, however, an occasional refreshing exception to this rule—where local people and local government solve local problems in the old American way. The Saturday Evening Post told of one in a recent article.

Many years go the Miami Valley in Ohio suffered a disastrous flood. Instead of yelling for help from Congress, the citizens cleaned up the debris, assessed the damage, made a plan for the future and went to work. All they asked from any unit of government was permission to form a conservancy district with certain taxing powers. This granted, the district issued almost $34,000,000 in bonds and started a real flood control project. To quote the post, "There were no extras such as hydoelectric power, swanky fishing and recreation resorts of resettlement projects. Flood control was what the Miami Valley people paid their money for and flood control is what they got."

Now the district is about to retire the last of the bonds. Serious floods have been completely eliminated. The region owns the project, and it is free of politics. To quote the Post again, "Only 56 persons are employed on the entire project, hardly enough to staff the public-relations office of almost any washington bureau."

All this may seem old-fashioned to our present-day "advanced thinkers." If it is, thrift, freedom and local self-sufficiency are old-fashioned too.

Corn Production Hiked in Gibson

Humboldt, Tenn., Dec. 16,—(Special)—While Gibson County is not regarded as a corn growing section, it is rapidly coming into the realm of heavy production, with two recent harvest records by outstanding growers. They have placed the county in the 100 bushels or better per acre class, according to County Farm Agent Thomas B. Wingo.

Woodrow Lancaster, of Trenton, recently grew 109.44 bushels of corn on a measured acre, which reaches an all-time high production record in Gibson County. The corn was of the Tennessee Hybrid No. 14 and planted on June 5, 1946, and prior to planting he had soil analysis made by the Extension Service. He also used fertilizer based on recommendations made by the Tennessee Crop Improvement Association.

The other champ corn growers of Gibson County is J. Harris Scruggs of Humboldt. On his farm 100 bushels of corn to the acre on five and one-half acres were produced. Scruggs attributes his highly successful yield to proper rotation and fertilization practices.

4-H'ers Plant 10,000 Trees at South Carolina Camp Site

Helping to establish a recreation camp, 108 4-Hclub boys from 27 South Carolina counties planted 10,000 trees on the 256-acre camp site near Elloree, S. C., recently.

The State Forestry Service and the County Rangers cooperated with the Extension Service in carrying out the tree-planting demonstration. The boys were taught the meaning of reforestation, shown how to plant seedlings and protect trees against fires.

The 4-H camp is to be known as Camp Daniel in memory of the late Harry E. Daniels who was associated with Extension work in South Carolina for 26 years.

Family Food Plan

Mothers of young children sometimes feel they must plan two sets of menus—one for the youngsters, one for older members of the family. But actually, small children need the same basic foods as their parents, say nutritionist of the U. S. Department of Agriculture. The simple preparation suitable for cshildren's food also brings out natural flavors for grown-ups to enjoy.

For youngsters and adults alike, plan menus to include these basic food groups:

Leafy, green and yellow vegetables, at least once a day.

Citrus fruit, tomatoes; once daily, if possible.

Potatoes, sweetpotatoes; one or more servings daily.

Other fruits and vegetables; one or two servings daily.

Milk, cheese, ice cream; two or three times daily and in cooking.

Meat, poultry, fish; one daily, if possible.

Eggs; 4 or more per week per person.

Dry beans and peas, nuts; one or more times a week.

Flour, cereals, meal; (whole-grain or enriched) at every meal.

Fats, oils; some daily.

Suger, sirup, preserves; some daily.

By choosing the more plentiful foods from each group, the family usually can adjust to changing food supplies, and still be sure of a well-balanced diet. Also, foods that are more plentiful are likely to be less expensive.

When there are small children in the family, avoid very salty or highly seasoned dishes, rich or greasy foods. Ice cream, custard, fruits and junket make good desserts for all. When pie is baked for the grown-ups, the children can have the filling, baked in custard cups.

A new booklet, "Food For the Family With Young Children," tells how a typical young American family; mother, father, and two children under school age; can have appetizing, healthful meals for all at a cost of about $15 to $17 a week. Included are a week's sample shopping order and the menus based on it. The booklet also offers tips for cutting food bills. Single copies of "Food For the Family With Young Children" may be had free by writing to the Office of Information, U. S. Department of Agriculture, Washington 25, D. C.

Mitchell Attends Conference on Juvenile Delinquency

John W. Mitchell, Extension Service field agent, attended the National Conference on the Prevention and Control of Delinquency which was held here in Washington recently.

Rural aspects of juvenile delinquency was one of the problems taken up by the conference. A committee was named to study the problems and make recommendations to the body. The chief recommendation was to get at the facts by collecting statistics on rural juvenile delinquency. It was pointed out that the pattern of rural living—isolation and the extensive ultization of children in farming operations—perhaps contributed to the delinquency problems.

Why Sugar Is Short

Americans would like to have about 100 pounds of sugar annually per person, but we are only getting about 72 pounds each. There'll be more for us by April 1947, but unlimited supplies will not be available for many months.

The Production and Marketing Administration recently summarized the main reasons for the scarcity of sugar briefly as follows:

1. Present continental U. S. sugar production is about 30 percent of the 1946 estimated distribution.

2. Because of war damage, we won't be getting much sugar from the Philippines before 1948—the U. S. formerly imported about 1 million tons annually from the Philippines.

3. Java will probably not produce again for export before 1948—before Japanese occupation of Java it exported about 1,250,000 tons of sugar to countries friendly to the U. S.

4. The important prewar beet sugar industry in European countries was badly injured during the war—it is making a steady but gradual comeback.

5. It is impracticable to increase substantially the cane sugar production in La., Fla., Puerto Rico, Hawaii, or the Virgin Islands.

6. Cuba and, to a lesser extent, other Caribbean areas have become the "world sugar bowl." Although Cuba sugar production has increased substantially, it cannot offset losses suffered in all other parts of the world.

7. Americans would have a little bit more sugar if we had refused to share any supplies with our allies or had refused to extend a minimum of aid to liberated areas.

Agricultural Outlook in China and Phillipines

The agricultural outlook for China and the Philippines is not especially bright, said Dr. Claude B. Hutchison of the University of California, and Dr. Leland E. Call of Kansas State College in reporting the findings of the Agricultural missions to these two countries.

Dr. Hutchison and Dr. Call, who headed the U. S. Sections of the missions to China and the Philippines, respectively, made their report in the Department of Agriculture auditorium last week. The latter said that sugarcane plantations and sugar processing plants in the Philippines suffered great devastation during the war. He indicated that the country might not be able to get back into full production until 1948.

China's great needs, said Dr. Hutchison, are agricultural education, adequate low-rate credit, and a reduction in tenancy. He suggested that China's extension service be expanded considerably and its land-ownership program be accelerated, However, he pointed out that the percentage of tenancy in China was no greater than it is here in the United States.

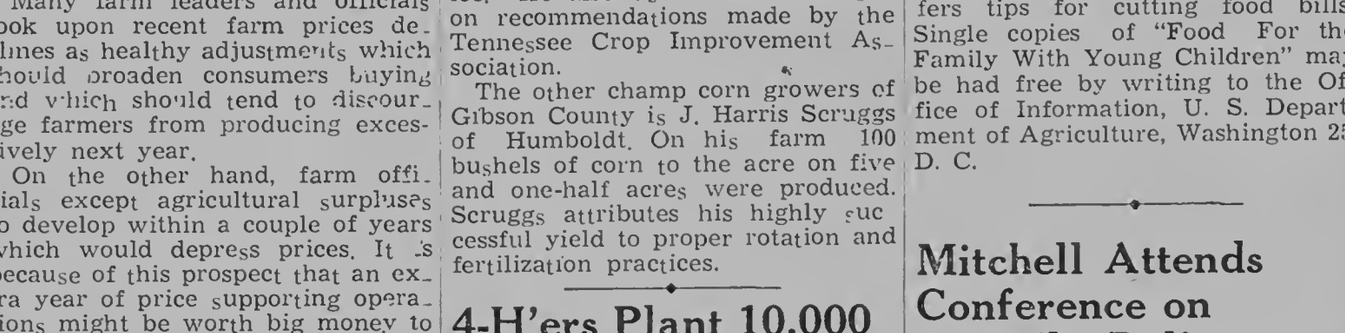
Grow More Food for Home, Sale

The farm women in Madison County, Alabama, are growing and saving more food for their families and for sale. Money from the surplus products is being used to improve homes.

One of the women, Mrs. Tommie Braggs of Mt. Camel Community, is raising poultry and growing a good garden.

She has a surprise for her family. She is planning to buy something that is very much needed in her home. She says, "Poultry is going to do it. I have 200 fryers and broilers on my yard today and 65 turkeys setting on 44 turkey eggs. I sold some of my chickens to buy turkey feed. Home-grown feed helps to cut the cost of raising chickens.

"I have any vegetable that one might expect to find in a North Alabama garden. I am canning plenty of all the vegetables that I will not have in my winter garden."



VARSITY SQUAD AT ST. EMMA MILITARY ACADEMY

ROCK CASTLE, VIRGINIA. The St. Emma Military Academy, for the first time in four years, has embarked on a regular schedule of games with neighboring schools. The entire Eastern United States is represented in the two lines and two backfields of the Varsity squad shown in the photograph. Left to right, front row, are Cadets Lacey, Smith, Rhone, Wilkins, Collins, Redmond, Thomas, Rogers, Campbell, Simmonds and Jones. In the back row, Cadets Stokes, Small, Franklin, Deans, Freeman, Brown, Dandridge, Milliman, Sparrow, Solomon and Morant.

All students at St. Emma are taking an active interest in football, and games between the class teams of this boarding high school enliven the fall afternoons.

Rural Health Needs Emphasized by Dr. Brown

"We take home remedies, we pray, and we die in many rural areas for sheer lack of adequate medical care," and Dr. Roscoe C. Brown of the U. S. Public Health Service at a recent meeting of colored Extension Service supervisors at Southern University, Baton Rouge, La.

Dr. Brown discussed the subject: "How can Extension Service cooperate with local health agencies in furthering health programs. Pointing out the inequalities of health facilities between white and colored groups and the lower resistance of Negro Americans to some diseases, Dr. Brown said that the Negro's life expectancy is 12 years less than that of the majority group. "In terms of facilities, we are a minority that needs more, but has less," said the Public Health official.

"Because of the shortage of doctors, hospitals, and clinics, available to rural people, there is not much that most of us can do toward providing curative facilities for the sick who live on the back roads," declared Dr. Brown, "but Extension personnel can do a great deal to help keep rural people well."

Information about prevention of diseases ought to be made available to as many rural people as possible, the doctor said. And he called on the supervisors to get acquainted with such local sources of health assistance as the County Public Health Unit, American Red Cross, American Social Hygiene Association, American Cancer Society, the National Tuberculosis Association, National Federation for Infantile Paralysis, and State and local medical and dental associations.

Dr. Brown suggested that Extension agents might get a health education program started in their counties by organizing a health discussion group. He pointed out that often out of discussion groups come the establishment of clinics and other facilities.

Coordinated Transportation

It is time that the transportation policy of this country was overhauled in order that all common carriers may coordinate to provide the most efficient and economical form of service—and that all may pay their own way to the greatest possible extent. As P. Harvey Middleton of the Railway Business Association recently said, "Railroads cannot continue indefinitely under a policy of self-supporting transportation versus government-aided competitors and still provide the service the nation needs in time of peace and must have in time of war."

The only major form of transportation which is entirely self-sustaining at present is the railroads. They buy and maintain everything they use from locomotives to track and terminals. Motor carriers, on the other hand, have the public highways as their rights of way. The airlines have the enormous advantage of publicly-built and maintained airports and terminals. The great cost of these is becoming a very real problem to the taxpayers in these days of more and bigger planes, and rapidly increasing congestion on the major air routes.

It is the view of the railroads that sound transportation coordination would result in traffic going to the type of carrier which can best handle it on a cost and service basis. The existing law generally bars a railroad from operation in competitive forms of transport except for limited auxiliary services. As a result, the law prevents the public from receiving the best possible transportation for goods and passengers.

We need a transportation policy which neither penalizes nor favors any carrier—and which permits all carriers to work together to best serve the nation. The job of formulating that policy should start at once.

Some people think of the depression as the good old days when there was only a shortage of money.

The Edison Centennial

Next February 11th, the Centennial of Thomas Edison's birthday will be celebrated throughout the country. Magazines, newspapers, radios and the motion pictures will devote space and time to the life and achievements of the man who made the electric age possible.

In this country, where industrial, farm and home electrification have progressed far beyond the rest of the world, our debt to Thomas Edison is immeasurable. Nothing ever devised or discovered by man has done so much for all the people as electric power. It is both the most efficient and the cheapest of servants. It has enormously increased the productivity and the earning power of the worker. It has revolutionized the techniques of agriculture.

Thomas Edison's living monument is found in the great industry which his work brought into being. Courageous individuals pioneered electrical development in the days when many a skeptic thought it an impractical fad. They provided electric service for every section of the country. Year in and year out, the industry they founded gave us more and more power for less and less money. It created enormous taxable assets for all units of government. It became a great civilizing agency as well as a great economic agency. And today, instead of resting on past laurels, it is looking forward to new horizons, to more and greater achievements. As an example, it recently announced a $300,000,000 rural electrification program designed to bring practically all farms within easy reach of power lines.

The Edison Centennial is fully deserving of the elaborate observance it is to receive. It memorializes the most amazing era of economic progress and human betterment in the long sweep of world history.

Colored Farm Women Save $100 Cleaning Own Sewing Machines

Colored farm women of Morgan County, Alabama, have saved nearly $100 by cleaning and adjusting their own sewing machines, the Alabama State Extension Service reports.

Under the guidance of Miss Elouise F. Libscomb, the colored county home demonstration agent, the women cleaned and adjusted 18 machines. In this operation only $1.80 worth of materials were used. This included three gallons of mineral spirits and two small cans of machine oil.

The home agent points out that the regular charge for cleaning and adjusting a machine in her county ranges from $5 to $10.

"Someone Was Careless"

Good advice to the nation came over the air waves when Edward J. Hickery, State Fire Marshal of Connecticut, spoke on a country-wide broadcast sponsored by the National Board of Fire Underwriters.

"I want to warn you about a disaster that might strike at any one of you—the disaster of fire," he said. "Throughout our nation the toll of lives and property from fire is mounting to an unprecedented, all-time high. . . .

"Most of those lives were lost because someone was careless. We here in America must realize now that each year we are destroying—largely through our own carelessness—the lives of 10.000 of our people and almost $600,000,000 in homes, business properties, commodities and natural resources.

"No nation, not even ours, can afford to be so wasteful. No nation is rich enough to squander its human and material wealth as we are doing today."

The tragedy of fire lies not only in its ghastly toll, but in the fact that it is needless. Not more than one fire in ten can honestly be said to be "unpreventable." The human factor is the cause of the other nine. And that human factor means you and your neighbor—every one of us.

Tax Reduction Means Budget Reduction

A great many of the members of the coming Congress have pledged themselves to early income tax reduction. That, if it is done, will come as an enormous relief to a tax-weary country. But it obviously cannot be done so long as we stagger along under a $40,000,000,000 annual national budget in a time of peace and record employment. The inescapable prelude to tax reduction is a very sharp and drastic reduction in Federal spending.

The details of the budget are the function of the budget bureau and Congress. But there are certain directions in which many millions can be pared from the budget which are obvious to any citizen. Further Federal development of power dams is one. At the present time, the managers of such socialistic enterprises as TVA are crying for more funds. Eager advocates of new and immensely costly ventures such as the Columbia Valley and the Missouri Valley authorities are pelting Senators and Representatives with their demands. And the fact is that none of these tax-exempt proposals would give the nation a single, solitary thing that highly-taxed private enterprise cannot give it if it is permitted to go ahead, free of the fear of destruction through socialization.

Private money, instead of tax money, will give us all the electric resources we can employ now or in the future. And private money would create vast new taxable resources for communities, the states and the Federal government. Socialized plants, on the other hand, remove property from the tax rolls and demand more taxes from all remaining taxpayers.

Congress, if supported by the people, can make an excellent start in the direction of tax reduction through expense reduction by saying a firm "no" to all such schemes.

Make the Farms Hum

By Grace Armstrong Allen

I wish about a thousand letters bearing Tennessee postmarks and airmail stamps were going out today, reading, "Dear Santa Claus: Please send me a book about starting right with bees, because I'm going to start in the spring; and also a good bee journal"

That opening paragraph was written, there was an interruption, and before getting back I had read the 1947 Beekeeping Goals of the U. S. Department of Agriculture. The department proposes an increase for the entire country of 347,000 colonies, or about 6 per cent above 1946. No increase was specifically urged for Tennessee, partly because we do not get here the truly remarkable crops obtained in such sections as Nebraska, the Dakotas, Minnesota, and a few other states. But, even as every farm has chickens, fruit, and vegetables, without expecting sensational money returns, so practically every farm should have bees.

Suppose 500 to 1000 Tennessee farmers put bees on their farms next spring. That would mean not only honey on their tables but also more fruit set in their orchards and more clover and other grain seed produced in their fields. And after a year or two, there may well be cash from surplus honey sold. No one, however, would expect to get his investment back the first year.

The first thing for a beginner to decide is how many colonies he wants for his start. Then he must figure out what supplies will be needed, and where he will locate his apiary.

How many colonies? If he has had no experience at all with bees, two or three are enough for the 1st year. Better to work carefully and intelligently with just one, even, while learning to handle them, than to have a lot of hives, feel unequal to their care, and so neglect them.

One usually gets his first bees in one of three ways. One may be able to buy fully established colonies, when illness or death or moving has put them on the market. But, unless he has complete confidence in the seller, a beginner will need help in judging them or they may bring only disappointment. One has to check on several features. The hives themselves should be well built, factory-made, standard size; the combs also should be well built, and in good condition, straight with a minimum of drone cells; the colony should be populous and queen-right, with both brood and stores ample for the time of year. Above all, they must be free from disease.

Another way to start is convenient if one has a neighbor beekeeper who expects swarms but doesn't want more increase and will agree to sell a swarm next April or May. Stipulate a good large one and get a hive prepared and taken to him ahead of time. Leave the hived swarm there with him, if he is willing, until the foundation is drawn into comb and the bees are well established. Then screen the entrance some night after the bees are all in, and take them proudly home the next morning.

A third way is by buying pound packages of bees. One benefit of a bee journal is the advertising. The reader not only reads news and informational articles, but also learns where to buy pound packages, queens, hives, etc. You could order a three-pound package, with queen, to arrive in late March or early April. Have your hive set up and ready before they come, and then proceed according to directions. Success with package bees in this section varies widely, depending largely on weather conditions (as does everything the farmer does.) These bees must be watched carefully until they and the weather are both well settled. Orders for pound packages should be placed as soon as possible, to insure prompt delivery.

When getting your bees this way, from a regular producer you can choose the race you prefer. Italians are most popular, and probably best to begin with. You will also get a pure-bred queen with them. When buying swarms or colonies from neighbors, or others, avoid common black bees or so-called "hybrids." They are almost always cross and hard to handle. Requeening will, of course, correct that in time, but the beginner may get so many stings that he will get discouraged, and lose heart and interest. Anyway, he won't want to requeen his first year.

Club Work Is Fun to Talladega Girl

Sallie Ann Brown, 13-year old clubster of Briorfield Community, is doing a good job in food preparation, food preservation, and raising livestock. She is learning to prepare well-balanced meals and has canned 125 quarts of fruits and vegetables this year. This clubster is also fitting her calf for the annual show next April.

Sallie has been a 4-H Club member for 3 years and has never missed a meeting in her community. Each year she has always completed her 4-H projects. She has continually followed practices recommended by her home demonstration agent. Sallie is also a member of the Talladega County 4-H Club Council.

"I enjoy carrying 4-H Club projects," says Sallie. "I like cooking very much. I think it is a lot of fun, even now when you have to use substitutes for hard to get things."

Egypt to Raise Nutritional Level

Speaking before a plenary session of the FAO Preparatory Commission on World Food Proposals recently, His Excellency Saba Pacha Habachy, Egyptian representative, told the body that his country was taking steps to raise the nutritional level of its people and to help farmers receive a larger share of the national income. Mr. Habachy said that his government had appropriated 20 million dollars to be spent in a special campaign against want, ignorance, and disease.

The Egyptian representative also endorsed the general objectives of FAC as expressed at the Copenhagen conference. These objectives were: (1) To raise the nutritional standards of the people, and (2) to stabilize agricultural prices at levels fair to producers and consumers alike.

That Industrial Dollar

A very large part of the public has a completely wrong conception of what happens to the earnings of industry. That is the gist of some recently published surveys.

One of these surveys, for example, produces the fact that the average worker, including white-collar and technical men, believe the average manufacturer makes 25 per cent on the volume of business done in peacetime. The actual net income, for the 1927-43 period, was under three per cent of sales volume.

An exhaustive study of profits in the steel industry, made by Peter F. Drucker, the well-known writer on corporation affairs, is illuminating. Many persons felt that steel wages could be substantially increased by cutting into the industry's profit margin. The fact is, according to Mr. Drucker's analysis, that profits are the smallest part of the steel dollar. In 1944, out of each $7,100 of product-value made by a steelworker, the worker himself got $3,038. More than $2,700 went for material costs, $350 for debt interest, $200 for depreciation, and $550 for taxes. The profit earned was only $205.

What this all adds up to is that there is no miraculous method of raising wages by reducing profit. If all of an average industry's profits were divided among its workers, the take per person would amount to only a week or two's wages. Pay can only be increased either by raising the cost of the product to the consumer, or by increasing output per man-hour. Under the first method, no one benefits as pay increases are automatically absorbed by higher living costs. Under the second method everyone benefits and the national standard of living rises. That truth should be thoroughly understood by every producing American.

Oil Needs for Tomorrow

Does this country need a strong and aggressive oil industry in time of peace as well as in time of war? That question is well answered by statistics on anticipated future demand.

It is estimated that by 1965 the demand for oil products in this country alone will approach 6,000,000 barrels daily—an increase of 2,000,000 barrels a day over 1939. Automobiles consumed 983,000 barrels of gasoline daily in 1939. The outlook is that in 1965 they will consume about 1,900,000 barrels. Fuel and heating oils amounted to 1,256,000 barrels a day in 1939 and in 1965 the total will probably exceed 2,000,000 barrels. So it goes, down the long and growing list of oil uses.

It is pleasant to report that there is no question of the industry's ability to do the job. It is constantly seeking and finding new reserves. It is increasing the recovery from proved reserves through better methods. It has made signal progress in learning how to develop coal and oil shale at lowering costs. And it has an invaluable and almost limitless resource in reserves of natural gas.

The oil industry is an example of the ability of free enterprise to anticipate and to meet a demand that would have seemed incredible twenty years ago.

Don't marry a girl because she looks sensible. A sensible girl has more sense than to look sensible.

New High-Yielding Red Clover Is Announced

After 10 years of experimental work, the Kentucky Agricultural Experiment Station announces progress in developing a new high-yielding variety of red clover.

Called Kenland, this red clover produced 9,121 pounds of dry matter in three cuttings in 1946. Hay yields would be about 10 per cent larger. Other varieties produced as follows; Kentucky No. 215, 8.082 pounds; Cumberland 7,485 pounds, and Midland 6,750 pounds.

WOMAN'S PAGE

Is Meal Planning a Chore? Try These

Planning meals shortly at this season is something of a task, for one has the holiday drains on the budget to consider. Since during the holidays we are tempted to treat ourselves to those foods we like rather than those which we know are good for us it is well to concentrate for a few weeks now on simple meals with energy-building qualities, seeking also something which is not extravagant.

But it is well occasionally to have something with a forecast of holiday goodness, and I think that you will find that in the chicken paprika which I have prepared for today's menu.

There is a happy knack of making meat or fowl go a long way when you use a cereal product such as noodles, macaroni, spaghetti or rice or barley with meat or fowl. Everybody knows that these foods are filling and satisfying and that they are also kind to one's budget.

There are many ways to combine chicken or meat with cereals, and a dish which smiles at the prices can bring smiles from the family when it happens to be noodle nugget loaf. Another marvel which helps the food budget over the hurdle is a scalloped noodle dish with deviled eggs or chicken.

For use with frankfurters or cold cuts at an informal supper try a dish of fine-quality noodles which have been heated in bacon drippings (if you can run down the bacon, or ham drippings, seasoned to taste and sprinkle with grated cheese, either American or Parmesan.

If you should have some bits of chicken left over from your paprika dish or from Sunday's baked chicken, combine those pieces with noodles, and you will have an economy dish welcome to your budget. To do this, dice the chicken and serve it over the noodles in a sauce made from chicken broth. Chopped green pepper and pimiento, mushrooms, peas, or left-over vegetables may be added to the sauce to make this a one-dish meal.

Another simple way of stretching a bit of left-over chicken to feed the family is to dice it in white sauce, add some cooked peas or beans and perhaps a bit of curry powder to give it a new flavor note. Serve this over rice or tender noodles.

There's always spaghetti with mushroom sauce which you can turn to on days when the budget needs a little assistance, and the ingredients you should be able to find on your own pantry shelves. The sauce is made by diluting a can of mushroom soup with an equal amount of milk, seasoned to taste and heated in a double boiler. A teaspoon or so of Worcestershire sauce adds a lively flavor. Fold the cooked spaghetti into the sauce and serve hot.

If you have a few slices of bacon, cook and dice them, and fold them into the mushroom sauce with a tablespoon of pickle relish. A tasty addition which will serve just as well as the bacon is some flaked tuna fish and a cupful of leftover peas or beans.

Planning a menu around any of the dishes which I have suggested is a simple matter. With the chicken paprika and noodles, I am serving pineapple-cheese salad, buttered green peas, bread sticks, coffee and egg custard pie. With pineapple on the market again, you will find that it furnishes a flavorful and refreshing accompaniment for meat or chicken. One green vegetable is needed to complete this menu. It could be broccoli, or Brussels Sprouts, in place of the green peas.

CHICKEN PAPRIKA

1 3-lb chicken
3 tbsp fat
1 onion chopped
½ lemon sliced
2 cups meat stock (which may be made from bouillon cube)

Cut chicken as for frying. Dip lightly in seasoned flour. Brown in fat on all sides. Add onion, lemon, 1 teaspoon paprika and stock. Cover. Turn heat low and simmer 45 minutes to 1 hour. Remove. Dust generously with paprika. Place on platter and surround with cooked noodles. Make gravy from drippings in pan. Strain and serve with chicken and noodles. Gravy should be seasoned with salt, pepper and a little Worcestershire sauce.

Here is the recipe for the filling of the egg custard pie you will want for dessert:

EGG CUSTARD PIE

3 egg yolks
2-3 cup sugar
2 tbsp cornstarch
¼ tsp. salt
2 cups milk
1 tsp. vanilla

Heat milk; beat yolks very light; add sugar and cornstarch. Beat again, mix with a little hot milk, and add to rest of milk. Cook until thick, stirring all the time. Line pan with pastry and bake crust until set. Pour custard in pastry and bake until brown.

TUNA FISH AND NOODLES CASSEROLE

1 pkg. noodles
1 clove garlic
1 cup medium white sauce
1 can tuna fish
½ tsp. salt
2 tbsp butter
1 green pepper, cut fine
1 small can mushrooms
⅛ tsp. pepper
½ cup grated cheese
½ cup crumbs

Cook noodles in water. Add garlic. Drain, rinse and drain again. Add all other ingredients except last two. Mix well, turn into a buttered casserole. Sprinkle with ¼ cup grated cheese and crumbs. Bake.

Spaghetti, properly seasoned, makes an excellent stuffing for peppers, and with eggs and cheese combined in this filling, you will have a dish which is an acceptable substitute for meat.

STUFFED PEPPERS

1 tbsp. salt
3 qts. boiling water
4 ounces spaghetti, macaroni or noodles
4 medium-sized green peppers
1½ cups medium cheese sauce
2 tbsp. chopped pimiento
2 diced hard-cooked eggs
½ tsp. dry mustard

Add 1 tablespoon salt to active-boiling water. Gradually add spaghetti and continue boiling until spaghetti is tender (about 12 minutes). Drain and rinse spaghetti. While spaghetti is cooking, cut thin slices from end of peppers in salted water 5 minutes. Combine cheese sauce, mustard, pimiento, and eggs. Fold spaghetti into cheese sauce mixture. Fill peppers with mixture. Bake in moderate oven (350 degrees F.) 20 to 25 minutes. Serves 4.

A savory loaf, which calls upon spaghetti, and no meat, may, like the stuffed peppers, be made with macaroni, noodles, rice or mashed potatoes in place of spaghetti.

SAVORY LOAF

1 tbsp. salt
3 qts. boiling water
4 ounces spaghetti
1 egg, slightly beaten
½ cup milk.
1 tbsp. Worcestershire sauce
⅛ tsp. pepper
½ cup bread cubes
2 tbsp. chopped onion
½ cup grated American cheese
1¼ cups condensed vegetable soup

Add 1 tablespoon salt to actively boiling water. Gradually add spaghetti and continue boiling until spaghetti is tender (about 12 minutes.) Combine egg, milk, salt, pepper, Worcestershire Sauce, bread cubes, onion, cheese and vegetable soup. Fold in spaghetti which has been drained and rinsed. Pour mixture into greased loaf pan, 4½ by 8½ inches. Bake in moderate oven (350 degrees F.) about 35 minutes. Serves 4.

I have already mentioned tuna fish, as a sauce ingredient to be used with noodles, to furnish a substitute for meat. There's always codfish balls as an alternative to meat, for they combine meat and potatoes and make a bit of fish go a long way.

CODFISH BALLS

1 cup fish
2 cups Irish potatoes
2 eggs
2 tbsp. butter
3 spoons cream
Dash of pepper

Soak fish overnight. Pick to pieces; add potatoes creamed, eggs beaten lightly, and butter. Roll into balls and fry in skillet, or dip in eggs and crumbs and deep fat fry. Makes 8 to 10 balls.

Do You Eat These Foods Every Day?

If you can answer YES after all items in the following quiz you have good food habits. If not, there is room for improvement and it's important to keep trying for a perfect score!

MILK— At least 2 cupfuls or enough cheese to take its place; they protect bones and teeth, and build muscles.

CITRUS FOODS OR TOMATOES—At least one serving. These are your main sources of Vitamin C which strengthens the blood vessels and is necessary for healthy gums and sound teeth.

GREEN OR YELLOW VEGETABLES—One big serving for the Vitamin A and iron which help guard against infections.

POTATOES, OTHER VEGETABLES AND FRUITS—At least two servings of these for additional vitamins and minerals.

EGGS, MEAT, FISH, OR DRIED BEANS OR PEAS—Two or three of these for muscle building material and vitality.

BREAD, CEREAL, WHOLE GRAIN OR ENRICHED— One serving at every meal. Here's energy, and the B-vitamins for steady nerves and good digestion.

BUTTER OR FORTIFIED MARGARINE—In moderate amounts. They give energy, and Vitamin A, and help make meals more satisfying.

Canned Food Storage

By R. L. RIVERS

Well planned storage space for canned foods is a good investment. Canned food spoilage due to lack of satisfactory storage is costly. First, because the homemaker's time and hard work during canning season are wasted, and second, because she may become discouraged and lose interest in canning.

Now, at a time when families are being urged to grow, use and save all food possible, the problem of storage becomes greater than ever before. Just as it is important and necessary that we produce all the food possible, it is just as important to provide enough convenient storage space for keeping that food in good condition until it is to be used. Every year many hours of hard labor are wasted, and money saved is thrown away in the form of spoiled food.

The problem of storage is not difficult, neither does it cost a lot of money. Just getting at it seems to be the biggest job. Many housewives merely wish for a place to store their canned foods, while others have found that some careful planning plus a little time and the use of a saw, hammer and nails wil lturn the trick.

Of course, if the work is done by men or boys in the home, it is usually a more finished and attractive job. In many instances it may involve remodeling the space already available. If there is enough wall space, rows of shelves may be built They should be 10 to 12 inches wide—only wide enough to hold jars two rows deep. This prevents having to move jar after jar to find the one wanted.

The highest shelf should not be more than 6½ feet from the floor. The shelves should be supported about every 2½ to 3 feet to prevent sagging or breaking under a heavy load.

Nearly all farm houses have enough scrap lumber about the place to build shelves, remodel old safes or cupboards, and build pantries. If not, it would be wise to buy some lumber or exchange some produce for it.

Regardless of the type of storage you build, place it near the kitchen. Also locate it where it will keep food cool in summer and will not allow it to freeze in winter.

Apples Are Good Eaten Raw or Cooked

Appealing to the eye, as well as being crispy and tasty, a large proportion of the apple crop is eaten raw. Although the favorite eating apples are those which have sweet, juicy pulp and a rich aromatic flavor, they are not necessarily the best for cooking. Cooking apples should have a fine-grained flesh that is juicy, at least medium tart, and with a distinct apple flavor. For baking, those that will retain their shape while the flesh cooks soft, becoming juicy but not watery, are best.

Apples are a good food that can be had when other fruits and vegetables are hard to get. They furnish vitamins and minerals and the crisp texture of the raw fruit serves as a mild sort of roughage. Eaten raw, apples serve as a good source of Vitamin C, necessary to teeth and bone formation, while the minerals play an important part in maintaining the normal alkalinity of the body. The firm texture of the raw apple makes it highly beneficial to the teeth while its succulence stimulates the flow of digestive juices.

You will find apples to be a most adaptable fruit; they fit in almost anywhere and everywhere: in salads, sandwiches and cakes. I am going to give you two recipes which have been given to me by a friend and which I believe you will like.

Dutch Apple Pie: 1 cup pastry flour; ¼ cup fat; ¼ teaspoon salt; 1 tablespoon ice water; 6 tart apples; 2 tablespoons butter; ⅛ teaspoon salt; ¾ cup sugar, and ¼ teaspoon cinnamon.

Sift the flour and salt. Add the fat and blend with two knives or a pastry blender. Add ice water, a few drops at a time, pressing the dough together. Chill and roll out to fit a deep pie plate. Cut peeled apples in quarters or eights, arrange in unbaked pastry. Melt the butter, add the sugar, salt and cinnamon, and spread over the apples. Bake until done and serve with cheese or whipped cream.

Here is a recipe for open-faced Apple Cheese Sandwiches, rather unusual and very good. These ingredients are needed:

White bread; 1-3 ounce package cream cheese; cream mayonnaise; apples, and ½ cup chopped nuts.

Cut the bread in ¼ inch slices and cut into rounds about two inches in diameter. Spread with mayonnaise and press nut meats in bread. Mix cream cheese with enough cream to make it spread easily. Spread top of bread rounds with this mixture. Just before serving, place apple rings, which have been cooked, on top of each cheese-covered sandwich.

Did you ever try apple sauce on a bowl of crisp cereal? This is a delicious breakfast treat. Serve with good, rich cream.

OVEN SALTED NUTS

Rinse in cold water: Walnuts blanched almonds, pecans, filberts or peanuts. Spread in shallow pan. Sprinkle with salt and 1 tablespoon butter to each two cups nuts. Bake about 20 minutes at 250 degrees.

For blanched almonds: Let shelled almonds stand in boiling water five minutes, until skins are wrinkled. Slip off skins between fingers. Dry before storing.

CHOCOLATE-COFFEE BLEND

For a hot drink for cold evenings try South American Chocolate. To make 1½ quarts, melt ½ pound sweet cooking chocolate over hot water; add 1 cup strong hot coffee; stir well; remove. Cook over low heat 1 minute. Scald 6 cups milk and add to mixture; simmer until piping hot. Beat until frothy on top. Set over hot water 10 minutes to blend flavors.

HOLIDAY FRUIT CUP

Many's the feast that will find its beginning in a fruit cup this merry Christmas season, because it is such a refreshing first course and so easy to prepare.

You will want to use your prettiest shallow glass bowls or sherbets together with service plates. Now prepare a mixture of sliced bananas, diced apples and pears, and grapefruit sections. Arrange the fruits so that some of the juice from the grapefruit gets mixed with the other fruits to prevent their darkening in color as they stand. Fill the glass bowls or sherbets with the fruit mixture and top each with a bright red maraschino cherry. Set the bowls on service plates and arrange greens snipped from the back of the Christmas tree around the edge of each plate so that they form a frame for your fruit cup. Tiny pine cones or a sprig of holly will add an additional festive touch.

Soggy, soiled dish towels are bacteria breeders and can easily make dishes unclean. Keep your dish towels clean and dry.

Try to prepare only the amount of food needed by your family each day. If there are "left-overs," use them promptly.

Kitchen fat salvage must continue to supply 10 per cent of the tallow and grease production, or there may be a still greater soap shortage. Fat and meat scraps should be saved while preparing foods. Don't regard any grease as too rancid or smelly to save. Every ounce helps.

VEAL CHOP SUEY

1 tablespoon fat
2 cups cooked veal, cut in strips
½ green pepper, cut fine
1 cup shredded onion
1 cup shredded celery
1 cup veal stock
1 teaspoon salt
½ teaspoon cornstarch
½ tablespoon cold water
¼ cup salted peanuts, shredded
2 tablespoons soy sauce
1 cup of combined bean sprouts
Water chestnuts, bamboo shoots

Melt fat and add veal. Brown slightly and remove from pan. To fat add green pepper and onion and cook for five minutes. Add celery, veal, veal stock, salt and cornstarch mixed with cold water. Stir and simmer five minutes. Add the bean sprouts, water chestnuts, bamboo shoots, soy sauce and peanuts. Keep over flame until all are thoroughly heated. Serve over fried noodles. Four servings.

THE MODERN FARMER

VOL XX. NASHVILLE, TENN., FEBRUARY 15, 1947 No. 1.

THE BYRD NEST

By Rev. Bernard O. Byrd
—Guest Columnist.

THE SPIRIT DEVELOPS STRENGTH

Like the preceding article: "The Spirit Dignifies," this treatise also is inspired by the face of the eagle in Ezek. 1:10.

Spirit led men know that though conversion may be apparently momentary; practical christianity from the standpoint of efficiency is progressive. Inasmuch as experience develops one's ability into a greater condition of strength; in the first stages of his activities when his effectiveness is limited, it may be considered weakness. This weakness is not a result of waning from standards, but rather it is because he has not grown into the power of standards.

All men are averse to weakness, that is if they are normal in their thinking. Even the man who follows the worst things of life, or the lowest things of life, wishes to be strong in that particular following. It is not unusual then to find a Christian seeking strength. It is possible, nevertheless, for many to be ignorant of the fact that idleness never develops strength: it is a result of constant striving spurred on by ambition and spiritual inspiration. A good example of this fact is seen in the way a mother eagle deals with her growing young.

The mother eagle builds her nest with two things in mind namely: an increase in the family and the development of that increase into strength and dignity. In spite of the purpose involved in building the nest, the mother eagle will not allow the comforts and protection of the nest to interfere with the development of her off-spring. When she feels that the little one's are hanging around the nest too long, she will tear up the nest to make it move out and try out the strength it has gained by the mother's care. This likeness is made to God's dealings with his children by the prophet Moses, revealing that often men take it too easy in the rendezvous of God's provisions and can be awakened to his duties only by God's tearing up of the man's comfortable nest.

As the mother eagle with her mighty wings slap her little ones off into space forcing them to put forth efforts to fly, so God with the hand of providence hurls man into space that he may try out his wings of prayer, which are covered with the feathers of faith and trust. It seems that some men will never learn how to sore through the air on the wings of prayer until some trouble has slapped him from the comforts of a nest built and softened by the grace of God.

We see God's great care for us again as we notice how the mother Eagle flutters or floats over her young. Where the scripture says that the Eagle flutters over her young, it means that while the young is trying to fly, the mother floats just far enough behind and above the eaglet to keep the little one from seeing her, but near enough so that when the little eaglet has gone its limit and is about to fall and be dashed to pieces on rocks or other things below, she the mother with her mighty wings outstretched, dashes quickly under the

Negro Chemist Helps Turn Corncobs Into Motor Fuel

Over $2,000,000 Allotted For Negro Extension Work

Washington, D. C.—Over $2,000,000 is being spent this year for agricultural Extension work among colored farmers, according to a report released recently by Extension Service of the U. S. Department of Agriculture. This represents an increase of 114 percent during the last five years.

The enlarged allotment makes it possible for Extension Service in the Southern States to employ 278 more colored workers than were on the staff at the outbreak of the war. The total number of colored agents and supervisors now working in the 15 Southern States stands at 817.

In commenting on the report, Special Assistants to the Secretary Claude A. Barnett of the Associaed Negro Press, and Dr. F. D. Patterson of Tuskegee say that the enlarged staff of colored county agents will make it possible to extend the services of the Extension to a good many farmers who have never been effectively reached. They all, however, that while this represents a substantial forward step in the Extension program, there is still need for additional colored Extension workers.

Both Mr. Barnett and Dr. Patterson have been conferring with State Extension directors from time to time in the interest of a more effective program for colored farmers.

In the appointment of new agents, North Carolina leads with 44, Georgia is second with 34, and Mississippi is third with 30. In the total number of workers, Mississippi comes first with 107 farm and home demonstration agents and supervisors for its 140,000 colored farmers; Texas comes second with 106 agents and supervisors for its 52,000 colored farmers. and North Carolina third with 99 agents for its 57,000 Negro farmers.

The report shows that in expenditures, North Carolina leads the other Southern states. It has allotted for Extension work among colored farmers this year, $473,506, or 23.5 percent of all monies to be spent in the State for Extension work. Texas is second with an allotment of $256,343, or 10.3 percent of its Extension funds; Alabama is third with an allotment of $239,133 and Mississippi. fourth with an allotment of $226,069.

Significantly. North Carolina, Mississippi, Alabama, and Arkansas have allotted over 14 percent of their Extension Service funds for work

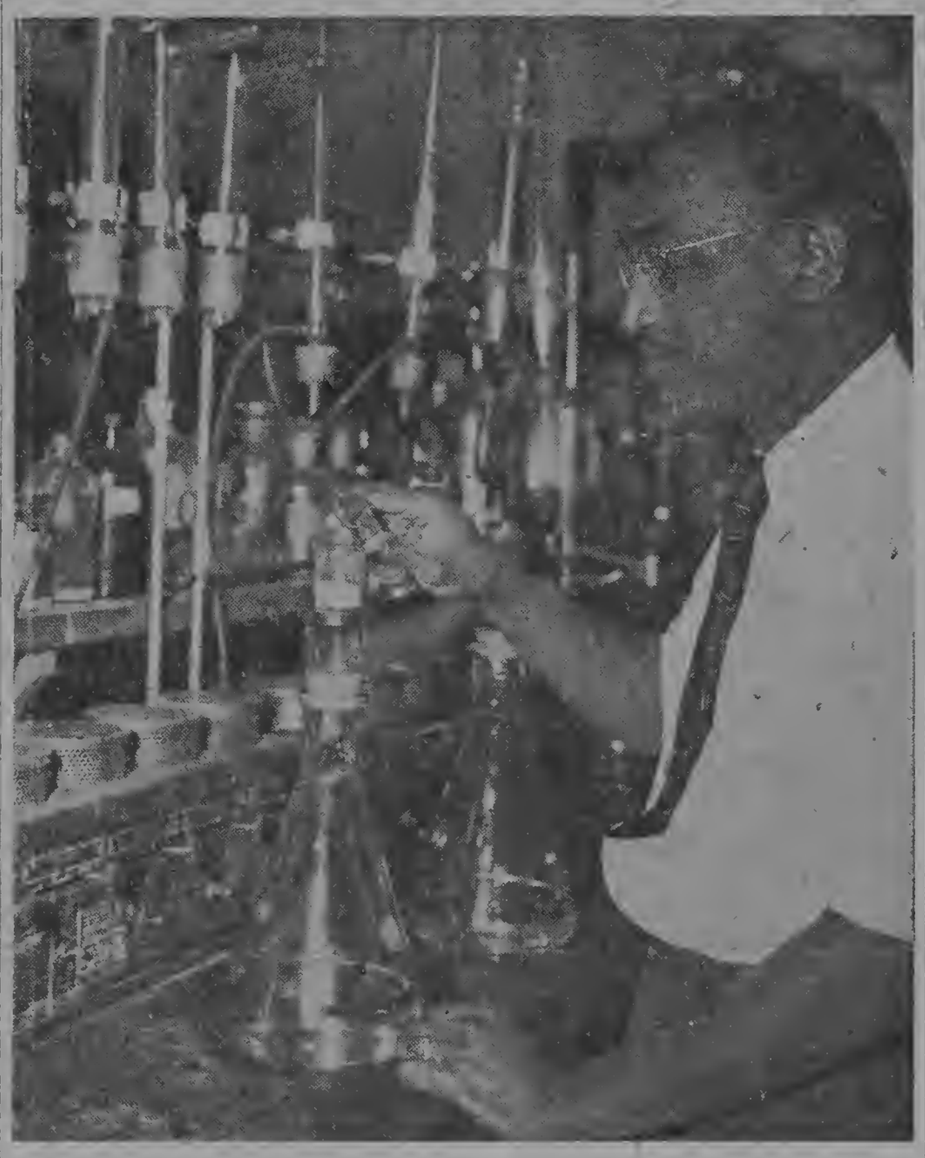
Motor Fuel From Corncobs



Herbert E. Smith, an analytical chemist of the Northern Regional Research Laboratory of the U. S. Department of Agriculture, has completed extensive analyses of corncobs which are the basis for a process of producing synthetic liquid motor fuels.

The Laboratory, which is situated in Peoria, Illinois, has built a demonstration plant for making motor fuels from corncobs and other farm waste. Smith is shown analyzing corn stalks.

Herbert E. Smith Who Specialized In Analytical Methods Making New Discoveries

WASHINGTON, D. C.—Herbert E Smith, a colored analytical chemist at the Northern Regional Research Laboratory of the U. S. Department of Agriculture, is assisting with a project designed to convert farm wastes into synthetie liquid motor fuels, says Dr. L. B. Howard, chief of the Bureau of Agricultural and Industrial Chemistry.

Smith, a graduate of the Illinois Institute of Technology, has specialized in the study of analytical methods as applied to agricultural residues, and has completed extensive analyses on corncobs which are used in the experimental manufacture of synthetic liquid fuels. Recently he has been analyzing corn stalks from flint and dent corn to ascertain whether or not there are significant differences in their composition.

Dr. Howard states that agricultural residues as corn stalks, corncobs, sugar cane bagasse, and peanut shells are estimated at 200 million tons a year. Half of this farm waste, he says, might be available for industrial uses leaving the remainder on the farm for soil conditioning purposes.

In order to complete research in the utilization of farm wastes in the production of synthetic liquid motor fuels, the Bureau of Agricultural and industrial chemistry has started operating a new semi-work synthetic liquid fuel plant at its Northern Regional Research Laboratory at Peoria, Illinois.

The process used in the new BAIC demonstration plant is an outgrowth of research carried out

Negro Cotton Farmers Up Income With Sweet Potatoes, Cane

Washington, D. C.—Typical of the thousands of white and colored cottor farmers who are increasing their cash income by growing sweetpotatoes and sugarcane as sideline crops, is Bennie Easley of Marengo County, Alabama, says Dr. J. R. Otis, state leader of Negro Extension work.

Last February Farmer Easley bedded out 18 bushels of seed sweetpotatoes from which to ge

U. S. D. A. Helps 199,000 Vets Find Farm Employment

Washington, D. C. Over 119,000 white and colored veterans of World War II were assisted in finding farm employment during the first 11 months of last year, reports the Extension Service Farm Labor Division of the U. S. Department of Agriculture.

Of the 119,515 veterans placed, 106,506 took jobs as hired hands, and 13,000 went into farming as tenants and sharecroppers.

Ex-GI's And Youths Promote Better Training In Virginia

Typical of thousands of colored ex GI's and older farm youths all over the South who are organizing agricultural clubs to promote better farming is the Nansamond Co., Virginia. organization, reports John W. Mitchell. Extension Service field agent of the U. S. Department of Agriculture.

Mr. Mitchell, who was principal speaker at the Virginia club's first anniversary observance recently, says that it was revealed at the celebration that the young club has already launched a comprehensive farm improvement program.

Composed of six ex-GI's and about a dozen older farm youths, the club has initiated hybrid corn, purebred swine, and poultry projects. Growing 16 acres of hybrid corn, as a demonstration, the club members got a yield of 60 bushels per acre. The eight members who tried their hand at raising purebred Berkshire swine got a fall pig crop of 53.

One club member, an ex-GI, selected poultry as his demonstration project. Starting out with 500 baby chicks, he has sold 250 fryers, 100 of his poorer layers, and still has 100 good layers that are bringing him $100 per month gross income.

County Agent James Harris, who organized the club, says that one of the ultimate goals is to improve the breed of livestock, poultry, and grain products in the county.

"It Could Overthrow The Government"

The return of the coal miners to work has not solved the basic issues involved in the coal controversy. The glaring fact remains that the miners stopped production at the order of one man, that they went back to work at the order of one man, that they can again walk out at the order of one man. This great nation, in effect, is existing on the sufferance of one man.

It is a misnomer to describe the present day coal strikes as strikes against the mine operators. They are strikes against the American people. The last coal strike was aimed straight at every home in America—every job in America—every business in America.

The return of the miners to work has not changed a situation which Judge Goldsborough put effectively into words in his decision, when he said: "If action of this kind could be successful, it could overthrow the government." It could, in short, do what Germany and Japan were unable to do in the greatest war of all time.

Furthermore, as one of the most prominent Senators said, the obligation of Congress to overhaul our labor laws and our labor policy has not changed—and it will not change regardless of the final decisions of the Federal courts. The duty of the courts is to say what the law means—the duty of Congress is to put into the framework of law the needs and desires of the people. And there can be no question of public sentiment when 400,000 coal miners place their interests above the interests of 140,000,000 men, women and children.

It is clear now that the Wagner Act has failed completely in its purpose—the elimination of strikes. It must be revised in principle as well as in detail. It is clear that labor must be forced to assume responsibilities commensurate with its power—precisely as industry, under strict laws, has been forced to assume such responsibilities. On what logical grounds can we continue to allow great unions, with millions of dollars in resources, to operate scot free of laws, passed in the name of the public interest, which govern all other enterprises?

The extremists in the labor ranks prattle of their rights and freedoms, and hysterically oppose every suggestion that would curb abuses. What these extremists really want is not freedom, but license. No man, no group of men, can be "free" to deliberately force this nation into industrial stagnation, widespread unemployment, and unimaginable destitution.

The goal Congress must seek is not punitive treatment of labor. It is, on the contrary, the placing of union labor on a basis of equality before the law instead of exempting it from the laws that apply to industry and all citizens. We must reassert the authority of the government—which is simply the authority of the people. All other domestic problems pale into obscurity beside this one.

Where Farm Power Comes From

The Rural Electrification Administration has received wide publicity as the great white hope of American agriculture so far as electric power is concerned. It has received enormous grants of money from the Federal treasury and has been staffed with an army of tax-supported job-holders. So it may come as news to many people to learn that the REA is a long way behind the unsubsidized private utility industry in the job of delivering power to rural America.

At present, about 60 per cent of electrified farms get their power from the private utilities, 35 per cent from the REA, and 5 per cent from municipal systems.

The utility industry, owned by hundreds of thousands of individual investors, has voluntarily taken upon itself the task of making power available, as rapidly as possible, to all the farmers of the United States. It is giving that task what amounts to an A-1 priority. To that end, it has made $300,000,000 available for needed construction and equipment. The program is national in scope and will be felt in every state. By the end of 1948, if the utilities are able to obtain materials, all but a very small minority of our farms will have a power line within easy reach.

Few farmers need to be sold on the value of electricity as an ally to help both in doing the work of farming and in improving the farm family's way of living. It is the cheapest of servants. It is always on call. And the industry which supplies it has a record of unbroken ever-improving service to the nation in war and in peace.

Ear Ornaments Flattering To Most Women

By Antoinette Donnelly

A correspondent complains that she cannot wear earrings becomingly, though she has the "soul of an earring wearer." She's simply mad about them. Her face is wide. It isn't young, she admits, and earrings only make her look hard and older.

True enough, there are some for whom the gods decree no earrings. If one woman finds them unbecoming, perhaps she can develop the soul of a bracelet wearer, be an anklet gal, or wear rings on her fingers.

However, with the countless designs we have seen on the earring market, we cannot imagine some one being unable to find one pair that flatters the face. There are elongated ones and triangular ones, bunchy ones. Some are big—some tiny. You don't have to adopt one of those hard, glittering designs that isn't too flattering to even a beautiful face.

Some girls aren't an earring type at all. Those who go in for sports and tailored dress, while they could use the feminine earlobe touch nicely, are inclined to leave them alone. We think that with a tailored suit, and an upswept hairdo, a cleverly chosen pair of earrings is a sweetening note.

Girls with cloudy long bobs have told me they're intrigued and so are their escorts by the occasional gleam of a bejewelled ear lobe. And right they are to accept the cue. The test of any gadget worn is the acclaim it wins.

One cannot set down any arbitrary rules in this individualistic era of ours. One might suggest, however, that the moon faced girl wear irregularly designed ear decorations rather than large round earrings. A long geometric design might serve. A trick of getting the right facial balance may rest with earrings, but we couldn't tell you how. You'll just have to experiment.

Job-Destroying Tactics

Labor must realize that its future welfare depends upon prosperous, producing industry. Broke industries, depressed industries, don't provide steady jobs at high wages. Yet some of labor's present policies are a direct threat to industrial solvency.

The suits instituted by CIO unions to get retroactive "portal to portal" pay are an extraordinary example of this. These suits will total $5,000,000,000 and perhaps substantially more. Entirely aside from the legal aspects involved, it is clear that, if all the demands are granted, many companies will be driven into bankruptcy, and many more will be seriously crippled—and forced to drastically curtail operations, purchases and expansion plans. That is the surest of all roads to depression and unemployment.

It is reported that Congress will act on the "portal to portal" problem—perhaps by limiting the time for which the back pay claimed can be awarded. But that, necessary as it is to the very preservation of our industrial structure, does not make the attitude of some labor leaders any less dangerous. These leaders are clearly out to milk business of every possible cent—regardless of the consequences to the country.

Once we forget that man's earning power must be based solidly upon his productive abilities and enterprise, we are paving the way for depressions and economic dislocations on a terrible scale. That is the real issue underlying the CIO's incredible policies.

Quality At Minimum Price

A recent release from the National Retail Dry Goods Association, which represents a large number of merchandising systems, illustrates the work being done by representatives retailers to protect the interests of the consumer.

The latter quotes Lew Hahn, general manager of the Association, who said: "Before the war, retailers carried goods of familiar quality at well established price lines. Consumers knew from experience what to expect from various types of goods. Retailers knew from experience at what prices such goods would most readily sell. During the war, all this passed out. . . .

"Now the war is over. The time has come to reestablish those conditions which make for orderly trade and consumer satisfaction. Because of inevitable increases in cost, it may not be possible to provide the qualities which were familiar at the prices which prevailed before the war, but there is a price at which those familiar qualities should be available. That . . . . must be a reasonable price and one which the great masses of the public can afford to pay.

"It is time that retailers began to show manufacturers the things which their public wants to buy and the prices at which it will buy them."

Retailers in all lines of business, including the progressive independents as well as the chains, are pursuing policies directed toward a similar end. Even as they attempt to hold price increases to the minimum, they are working to improve quality—which in itself is a form of price control. The end result is a wider variety of goods, of known qualities, sold at prices which are as low as the economic factors of the present permit.

A Billion Dollars Saved Taxpayers

The virtual demise of OPA is saving the American taxpayer over $1,000,000,000 a year. That billion is the money that used to be paid out to producers as subsidies in the days of all-inclusive price control.

The subsidy was a means of providing the consumer something at less than its going market value—and then collecting the difference from him at the end of the year by adding it to his tax bill. For the last fiscal year, Congress appropriated $700,000,000 for meat subsidies, $560,000,000 for dairy products, and $215,000,000 for flour.

The elimination of Opa resulted in immediate price rises to offset the discontinued subsidies—the consumer again paid the full cost of what he purchased at the time of purchase. That was responsible for most of the price increases that followed decontrol.

The end of these subsidies is a healthy sign. The subsidy principle may be justified as an emergency measure—and in some special instances it may have to be used in normal times to encourage the production of high-cost products desired by the government. But to subsidize part of the cost of producing and selling common commodities, such as foods, is to distort the price picture and to place the economy on a false and shifting foundation. We are attaining a more stabilized price structure now, based upon today's cost of doing business. Elimination of the subsidy, like the elimination of price control itself, was an unavoidable first step in revitalizing the machinery of supply and demand.

Gibson County Farm Trends Show Change

Humboldt, Tenn., Jan. 20.—(Special)—Gibson County Agriculture has made some interesting changes in the past 155 years, according to figures recently released by County Farm Agent Tom Wingo.

The number of farms has decreased from 6,815 to 5,474, however, the size has increased by 12 acres per farm, the present average acreage of a Gibson farm being 59.5 acres. In the 15-year period, the number of cows and heifers over two years of age has increased from 10,096 to 14,858, with the largest increases in beef type cattle.

Much stress has been placed on increasing or utilizing the grazing land on almost every farm land in Gibson County by preparing and seeding permanent pasture for as many calves and cows as practical.

The number of farmers keeping sows for pork production has increased from 1,164 to 1,796, and the number of sows has also climbed from 1,676 to 3,331 during this period.

Another very significant trend has been the increase in the past five years in the acreage planted to small grain. Five years ago 523 acres were combined against 3,233 acres during past year. There has been a slight boost in the corn acreage to bring it up to 66,142. Alfalfa acreage has practically doubled in the past 10 years, jumping from 444 to 907.

The sweet potato acreage has remained about the same with acreage slightly over 3,000 acres. The strawberry acreage has had greater reduction than any other crop, probably due to labor shortage in this area during war years, dropping from 2,554 to 835 acres. Tomato acreage has also felt the labor difficulties, as the tomato crop also requires much labor during the cultivation period. The tomato acreage fell from 4,678 to 2,177, and cabbage acreage has remained about the same over a 10-year period, approximately 7,000 acres in the county

U. S. Farm Exports Slated To Continue High Level

Agricultural exports from the United States will continue large, but probably below the level reached during the critical emergency in the first half of 1946, according to the Department of Agriculture. Supplies of most crops and livestock products are expected to be large, but large domestic demand and depleted stocks will tend to limit quantities available for export.

In general, the foreign need for American farm products will be less pressing than during the few months preceding the 1946 harvest. However, foreign demands for such products as grains will remain high since emergency conditions still prevail in many areas of Europe and Asia.

Preventing Utility Strikes

It is universally recognized that some means must be found to settle labor disputes within the utility industry without strikes. A shutdown of utility services is a direct blow not only at a community's industries, but the health and life of the people.

A group of utility executives recently met with officials of all the principal unions represented in the industry, in a conference conducted by the U. S. Conciliation Service. And it looks as if the groundwork has been laid for modern employer employe relations in this vital field.

In the words of Conciliation Service official in charge. "Both management and labor in the utility industry have a basic responsibility to the citizens of the communities which they serve. The representatives of industry and labor who have been meeting, recognize that this responsibility requires every effort on their part to maintain industrial peace . . . ."

One of the most encouraging phases of the meeting was that both sides favored voluntary plans for settling disagreements, and were anxious to avoid damaging ligislation that would place arbitration on a compulsory, government dominated basis. They were determined to guarantee continuity of utility services at all times—and to establish machinery for settling disputes that would operate fairly, impersonally, and reach decisions in accordance with the evidence.

This is the kind of work that gets results. It saves both industry and labor from laws that would sharply curtail their freedom of action. The degree of success achieved will have a direct bearing on the welfare of all.

Tax Readjustment

It now seems inevitable that the next Congress will make a start on a long-range program of government economy and tax revision, any tax reduction will necessarily be determined by the size of future national budgets.

It is very easy to say that we should keep on soaking the rich, and that whatever tax cuts are made should practically all be in favor of the worker of small and moderate means. The ability to pay will always be a determinative factor in tax policy. However, extortionate taxes on corporations and large incomes destroy the very source of capital which is needed to develop new industries, new scientific discoveries, and to create jobs and opportunities for all. The average man is the loser when that happens.

John W. Hanes, president of the Tax Foundation, recently made some suggestions of merit. It is Mr. Hanes' opinion that income tax rates should start at 20 per cent and rise to 45 per cent in the $50,000 bracket, 54 per cent in the $200,000 bracket, and reach a 70 per cent maximum at $1,000,000-plus. He urges that earned income should be treated much more generously than at present, which would be of benefit to all workers at all income levels. He advocates the elimination of double taxation on corporate dividends. Mr. Hanes believes in equitable tax adjustments that will not destroy the incentive to produce, invest and employ.

This is a pattern for a tax program that Congress should consider.

USDA Seeks Ways Of Cutting Cotton Marketing Costs

Marketing charges on cotton—from the farm to the processor—amount to about 200 million dollars on an average crop, or about $16 per bale, says the Production and Marketing Administration of the U. S. Department of Agriculture.

Believing that part of this huge cost results from our uneconomic ways of preparing cotton for market and of handling it in distributive channels, the Department of Agriculture is conducting a research program designed to reduce those costs.

Among the research problems which the Department is seeking to solve are:

(1) Reduction of waste in the manufacturing process by determining how the various measurable physical properties of cotton fibers in raw cotton are related to spinning performance and quality of manufacturing products.

(2) To discover how well mechanically picked cotton can be cleaned. Up to now they have discovered ways of cleaning from 60 to 82 percent of the foreign matter out of cotton. While 19 pounds of weight per bale are lost through the removal of moisture and foreign matter by the most effective cleaning process, the value of the bale is increasd by about $5.

(3) To discover variability in spinning quality of one variety cotton taken from any given one variety cotton community. This would aid in local marketing.

(4) Developing a simplified system of grading cottonseed—a system suitable for farmers' use.

National Garden Planning Week

February 2-8 has been designated as National Garden Planning Week by Secretary of Agriculture Clinton P. Anderson. This is the period when white and colored garden and horticultural leaders everywhere will organize local forces for an effective postwar garden program.

The garden goals announced by the Department in November were set to: (1) Insure better nutrition for many millions of American families: (2) provide families particularly those in lower income groups, with a net addition to the quantity of vegetables and fruits consumed by them (3) assist in meeting the cost of living; and (4) foster nutrition education and aid in the development of cultural values that come with gardening, home grounds, and community improvement.

Poultry, Livestock Water Warmers Prove Profitable; Prices Moderate

By Kenneth B. McPherson

Water warmers for heating drinking water in livestock tanks and poultry fountains are considered a necessity in northern areas. Here in the South, where a milder climate is enjoyed, they are in more limited than general use. We do have cold spells frequently through the winter months when the tanks and fountains freezc over. Much of the time, even though no iee actually forms, the water is so cold that a maximum amount is not consumed by the animals or birds.

Everyone knows the physical discomfort and disadvantages of having to carry hot water or break ice to permit the livestock to drink. We ean only imagine the physical reaction of the animals, but we do know that while we enjoy a glass of ice water under a shade tree in the summer when the sun is beaming down, we would drink little of it under the same tree on a cold winter day. The only reactions that are measurable are in the egg basket and the milk pail. Eggs are 65 per cent water and milk 87 per eent.

Observations which are fairly reliable indicate that hens, supplied with water held at a temperature of about 59 degrees day and night, will lay about a dozen more eggs during the winter than a hen supplied with water which drops to freezing or may have an occasional eovering of ice. The desirable water temperature for cows is less certain, but the constant availability of drinking water in locations protected from the weather has resulted in increased or the preventing of decrease of about 10 per eent in milk flow.

It is generally known by stockmen and poultrymen that change has telling effect on production. Change in feed quantity or quality, change in water consumption, or weather conditions may decrease production to a considerable extent. The water intake of animals can be maintained about constant by keeping it available at 50 degrees.

Electricity is undoubtedly the most care free and generally satisfactory method of tempering drinking water for livestock and poultry. Several companies sell reliable thermostatically controlled poultry water warmers and stock tank heaters and de-icers at moderate prices.

When a poultry floek is up to 60 per cent production, each hen will drink about one fourth pint of water daily. One of the common 14-quart buckets will supply each 50 hens or less, with larger fountains for flocks above 200-300. In each open pail or fountain, a regular 155-watt poultry water warmer ean be placed and the water temperature will be maintained around 50 degrees.

For open stock tanks, water can be kept at drinkable temperatures during freezing weather by placing a wooden float board on the surface with one or more stock water warmers attached to underside of the float board and connected to a line.

State's Farmers Now Using More Lime On Soil

More lime was spread on Tennessee farms this year than was spread on farms of all the United States 30 years ago, according to figures released by the Production and Marketing Administration.

This amount, more than one million tons, also shows rapid increase over the amount used in Tennessee in 1936 when about 166 thousand tons was used.

Use of lime is an approval practice under the Agricultural Conservation Program; and farmers developing their 1947 conservation plans are urged by soil and crop specialists of the U T College of Agriculture to make full use of assistance offered. Farmers should see their agricultural conservation eommitteeman, or county agent, for help on their conservation plans for the year.

Fertilized Corn Withstands Heat, Macon Tests Shows

The old idea that fertilized eorn "burns up" in hot weather was exploited in Macon County this year when demonstrations proved in every case fertilized corn withstood the dry weather better than the nonfertilized.

This was demonstrated on the farms of Leonard Meador, Booker Loftis, Tom Wheeler and J. G. Tucker, aecording to County Agent Charles W. Blankenship.

Meador and Loftis both increased their production 25 per eent by the use of 400 pounds of 4 8 8 fertilizer and 150 pounds of nitrate of soda per acre where Tennessee No. 10 hybrid seed was used. The fertilize hybrid produced almost 90 per cent more per acre than unfertilized yellow corn of eommon open pollenated varieties.

Meador produced 73.5 bushels per acre with the fertilized Tennessee No. 10 and only 40 bushels on the unfertilized yellow eorn. While the production on the Loftis farm was not as high, the percentage inerease was just as great. He produced 40 bushels per acre on the fertilized area and only 26 bushels on the unfertilized. Yields were somewhat lowered by the dry weather, Blankenship said.

The addition of nitrogen on the Tucker farm where corn was planted following lespedeza did not increase the output. A yield of 82.7 bushels per acre was reported on this farm.

Clean Eggs Help Poultry Profits

No matter how fresh they may be, eggs do not bring the highest price if they are not clean, according to Stanley Caton, University of Kentucky College of Agriculture and Home Economics. Caton suggests the following points in preparing eggs for market.

Clean "dirty eggs with emery cloth or fine teel wool. Don't wash. Washing removes the "bloom" and permits rapid evaporation from the inside of the egg.

Common causes of dirty eggs are muddy hens' feet, dirty hen-house floors, broken eggs caused by hens crowding on nests, not gathering eggs often enough and gathering in dirty containers.

Keep hens in the laying house until 1 or 2 o'clock in the afternoon, if the ground is muddy. Most of the eggs will be laid by that time.

Wire netting stretched on the roost poles above the droppings board or pit, will keep the hens from carrying filth to the nests.

A deep litter on the floor helps to keep the hens' feet clean. Nests should be kept bedded and clean Provide at least one nest for every four hens and gather eggs frequently, especially in the forenoon, when most of the eggs are laid.

To have eggs with strong shells, keep limestone or oyster shells before the hens. Hens must have direct sunshine or cod liver oil in order to form strong shelled eggs.

How Long Will The Eggs Last?

One of the immediate questions of the time is just how far labor Can go in its program of more money for less work and still leave solvent industry to provide the jobs.

The CIO claims that industry can boost wages by around $6,000,000,000 a year without raising priees, a statement which recent wage-price trende completely contradict. On top of such demands for increased wages, it is estimated that labor may now sue industry for as much as $6,000,000,000 in back pay for time spent in getting to work. This "portal-to-portal" pay is an indirect means of raising wages with no increase whatever in worker productivity—paying men for inactive hours. In other words, labor costs are again skyrocketing.

Industry and the consumer look like a plump goose—but labor may wake up one morning and find the goose is no longer able to provide the golden egg that means employment.

Winter Reduces Efficiency Of Unguarded Tools

Faced with continuing shortages of labor and machinery, farmers should realize that equipment left out in the weather or covered with dirt and grime cannot be expected to operate next year at maximum efficiency, M. T. Gowder, assistant extension agricultural engineer, UT College of Agriculture, said today.

Many farmers do not store part of their machines because of lack of storage spaee, he said. But often existing space, if organized to best advantage, would be adequate. With a little rough lumber, a desk can be made in most shelters for light equipment, and hangers can be made on walls for hitches, tongues, ete.

Before storing a machine, attention should be given to the way in which it is stored, Gowder advised. In strong binders, combines, threshers and hullers, remove sickle, canvass and reel slats, and prop up hitch and platform. Remove all chaff, grain and straw. Grease exposed metal, working parts, such as ehains, sproekets, cutter bar, shafts and gears. Remove and store belts and elevators. For mowers, remove sickle, store with frames and wooden parts relieved of strain. Points and metal working parts should be cleaned and greased.

In storing plows, rakes, cultivators, ete., prop up in such a way as to take the strain off wooden parts and clean and grease metal working parts.

Before putting tractors and trucks in winter quarters, drain water pump and radiator; drop heavy oil on cylinder walls through spark plug openings. Remove battery to safe place. Protect generator, magneto and other electrical equipment with waterproof covering. Take weight off tires.

Gowder suggested that farmers secure from their county agents, Extension Publications numbers 5148, 277 and 286, all of which are on the care of farm machinery.

To Serve The Public

The most compelling argument in favor of laws which would permit unification of the nation's transportation system, is the public interest. Colonel J. Monroe Johnson, director of the Office of Defense Transportation, touched on this when he said: "The justification of any transportation system lies in its service to the public. Unification must ultimately and properly be adjudged upon the basis of its possible public service rather than in the light of its effect upon the number of separate operating units of some particular type of transport."

The essence of unified transportation is to permit any agency of transport to utilize whatever kind of carrier is best suited to the desires and needs of the shipper. A railroad, for example, should be allowed to operate air and truck lines if by so doing it could render better service. The air and truck lines on the other hand, should be allowed to enter the field of transportation by rail. All carriers would be regulated by the Interstate Commerce Commission which would protect both the public and the competing carriers from monopolistic or unfair practices.

At the present time, various laws, regulations, and policies stand in the way of the operation of multiple-type transportation systems. As a result, transportation coordination is now impossible except to a limited degree— as in the use of motor vehicles by railroads to make door to door delivery of some classes of freight.

Coordination, therefore, must be preceded by enabling legislation passed by Congress. If that is done, the way will be paved for providing the public with the best and most flexible kind of transportation possible. The goal is maximum service with maximum economy. The beneficial effects would grow throughout the years.

Football bowls are in the spotlight right now; but it is cracked cotton bolls which take the "interest" out of ginners' and growers' profits.

Electricity Can Greatly Aid Farmers In Raising Lambs

By Kenneth B. McPherson

Electricity ean make a great contribution to any farmer in Middle Tennessee who raise sheep. It can readily increase his profits or in many instance be the difference between financial gain or loss in this enterprise. Electricity can not take the place of protecting shelter, it can not give the human care necessary at lambing time, but it will do some job that the herds man can not do himself, and can assist him in everything he does himself.

"Tennessee Spring Lamb," is a meat animal that is well known and generally in great demand throughout the country. "Tennessee Spring Lamb" is praetically a trade name because farmers in this state are able to produce this choice meat for early market on our winter cover crops and blue grass pastures. These lambs usually begin to appear on the markets about Easter and command the highest prices.

There are few farm animals that pay the high return on the investment every year that the ewe does With a minimum of feed and labor it is not unusual when she pays for herself every year with her production of lambs and wool.

In order to have lambs ready for the early market they must come in the winter when weather conditions are most likely to be unfavorable. Lambing time is one of short duration but it is the time when speeial attention must be given to the flock, so that every lamb may be saved. Cold rain and freezing temperatures can quickly erase the profit from the lamb crop. The remuneration for the year's work of a sheep depends largely on the care given her during one hour in the winter.

No perfect method of warming and drying lambs has been developed, but case histories show that deaths at birth are greatly reduced by immediately placing the lamb in a temperature-controlled brooder. This device along with plenty of electric light for the herdsman will save lambs.

Lamb brooders are simple to make and need not be expensive. Generally there will be enough material around a farm but even if it is not available and has to be bought, the cost is low.

The brooder is merely a heated box. Heat is supplied either by an electric light bulb, radiant heater (such as is used to take the chill off rooms on cold mornings) or a heating element.

For our climate a large wooden box supplied with four 150 watt electric lamps gives excellent results. Care should be taken to see that all fire hazards are eliminated and the lamps so placed that the lambs will not receive burns.

When the lambs are born they can be placed in the box until they are dry and then be turned back with the mother.

Winter Gabbage Plentiful

New cabbage from the South will be plentiful on January markets generally, according to marketing specialists of the U. S. Department of Agriculture. Largest shipments will come from Florida, Texas and California and smaller supplies from Arizona. The crop is expected to total about 338,000 tons.

Along with the new cabbage, markets in Northern areas will have stored cabbage from the fall crop to offer. Storage houses in New York State still have large supplies of fall cabbage, these in Wisconsin, smaller supplies. New cabbage usually sells at a higher price than stored cabbage but late in the winter offers more vitamin C because cabbage loses some of this vitamin during storage.

New York State has so much stored cabbage that kraut factories are continuing to operate during the winter. They have already filled their tanks once and now are putting this kraut in barrels, cans, and jars, so that the tanks may be refilled.

For The General Good

Some 35 electrie power companies, located in 20 states, are about to launch an ambitious drive to increase the farm's income through an extensive agricultural development program. As a spokesman for the power industry pointed out, "Power companies are rapidly realizing the part that they can play in bringing about more effective eonservation of natural resources, acceleration of farm production, and greater economic stability for the farmer."

The drive has its basis in a program put into effect in 1936 by the Monongahela Power Company, which serves parts of West Virginia, Virginia, Ohio and Maryland. At that time, conditions in the area were definitely substandard. In 1930, for instance, the average value of the farms in the Monongahela Valley was $5,502, as compared with a national average of $9,103. In the 20 years prior to 1930, the average value of the Valley's farms had increased only 29.7 per cent, as against 41.3 per cent for the country as a whole. And in 1932, 36 per cent of the farm land and 55 per cent of all the farms were ax-delinquent.

The plan adopted by the utility was a sweeping one—and many of its projects in no way involved the use of electricity or power-consuming equipment. Soil conservation was stressed. Valuable instruction was given in the prevention of erosion, and the intelligent use of the farmer's principal asset—his land. Agricultural marketing methods, resettlement, and livestock breeding programs all had a dominant place in the plan. As an example of the success attained, farm income in the area has risen from $358 in 1935 to an average of $1,200 today—and close to 2,000 families are now participating as against 287 a decade ago.

This is the kind of work that is soon to be done on almost a national scale. It can best be described as progressive activity for the general good. And it is indieative of the spirit and the ideals of service which dominate the utility industry.

Bureaucracy Is Static

The problem of better public health is not a matter which ean be simply and quickly solved by the passage of a law. It is a long range problem, whose ultimate solution lies largely in the medical laboratories.

Certainly, no country has made more significant progress in this direction than ours. Diseases which once were frequently fatal, such as smallpox, are now treated almost as simply as measles. In 40 years the death rate from tubereulosis has been reduced 75 per cent. The discovery and application of new healing elements, such as penicillin and the sulfa group, have almost completly provented the once dread danger of fatal infection, and are nearly totally effective in preventing septicemia and gangrene when proper treatment is applied in time.

So it goes, down the long list of past killers which are no longer lethal. These are a few of the achievements of free medicine—precisely as our achievements in the economic sphere are those of free industry.

There are sound grounds for believing that governmental domination of medicine would slow, and in some cases stop, this fine progress. Bureaucracy is always static. It is deadening, to the imagination, to the ambition. The doctor whose career depended upon political favoritism would not look ahead.

This does not mean that government should not assist the indigent to receive better medical care. A bill sponsored by Senator Taft, which would achieve that and also place the responsibility in local hands where it belongs, seems the best answer yet proposed to that problem. But government should not dominate or regiment the practice of the healing arts.

An irate gentleman called a newspaper editor on the telephone, stating his name. "Did you put that notice of my death in the paper?" he shouted. "Yes, I did," the editor admitted, "er . . . by the way . . . where are you calling from?"

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.

Giles A. Hubert _____Editor

at the northern laboratory by Dr. E. C. Lathrop and Dr. J. W. Dunning. The latter is the leader of this new project and will be in charge of the operation of the plant.

The new plant is expected to handle enough residues to provide sufficient fermentable material for the production of 500 gallons of alcohol daily. If experimental laboratory results are borne out in the semi-work operation, from 90 to 95 gallons of liquid motor fuels will be obtained from each ton of residues, about half in the form of ethyl alcohol. The ultimate aim is not to supplant gasoline as motor fuel, but to test the possibilities of making these new fuels cheap enough for use as a blending agent. Congress authorized a research program in 1944 which called for the building of demonstration plants to produce liquid motor fuel from nonpetroleum sources such as oil-bearing shale, coal, gas, and agricultural products. These new fuels, when developed, are to supplement—in case of need—the reserves of available petroleum. This research is divided between the Department of Interior and the Department of Agriculture.

U. S. D. A. Helps

(Continued From Page 1)

Overall 8,272,000 people were work on farms on January 1 of this year.. This represented an increase of seven percent over the number at work on farms the same date last year. There was a sharp increase in the number of hired workers. In the South the number of hired workers increased from 603,000 to 798.000. This was due to a number of faetors, among them: (1) A greater supply of farm workers, (2) exceptionally favorable weather, and (3) the need for maintenance work neglected during the war.

West Indies. workers totaled about 9,000 on January 1. They were employed principally in the South where they were working on truck and sugareane farms in Florida. A few were scattered over the Northeast and North Central States. Jamaicans totaled about 4,500, Bahamians about the same number and Barbadians about 600.

Over $2,000 000

(Continued From Page 1)

among colored farmers. However, more than half of all Negro farmers live in these five States. Large inumbers also live in Georgia and Louisana.

Greatest percentage increase in the allotment of funds during the last five years was made by North Carolina which increased its funds for Negro work by 241 percent. West Virginia made the second largest increase, 215 percent, and Louisiana made the third largest increase, 201 percent.

A comparison in the amount of funds alloted for white and Negro Extension work in the South shows that the former received $16,158,117.44 and the latter $2,213.209.46 or 12.1 per cent. During the last five years funds for whites increased by 55.9 pereent and for colored by 114 percent. However, in personnel and services. the Extension program for colored farmers still lags somewhat behind.

It is pointed out that still there are no colored agents in some counties with as many as 500 Negro farm families. Also assistant colored county agents are needed in some counties to help serve the large case loads which frequently number up to 2.000 farm families. But plans are underway for further expanding for Negro programs to meet these needs according to Extension officials.

The farm and home demonstration agents are Extension teachers of the land grant colleges. They carry agricultural and home-making training to farm families in their homes and on their farms. The lessons are taught by demonstrations.

Usually agents in each county organize the farm people into community farm, home, and 4-H clubs. In some counties there may be as many as 60 community clubs. These clubs meet monthly from home to home where the agents conduct demonstrations. For example, the home agent may show the women how to use a pressure cooker. Actually foods are canned or cooked with the utensil. The women learn by doing under the guidance of the agent.

While the women are learning about the pressure cooker, the men may be learning how to vaccinate hogs by actually vaccinating a few under the direction of the farm agent. The 4 H youngsters may join in these demonstrations with the adults, or they may have separate demonstrations. The agents meet a definite need in the life of rural people. It is pointed out by officials that through their work, significant gains are being made in rural home improvements and in better farming methods.

10,000 Ex-GI Farm Youths May Take Training

Knoxville, Dec. 23—(AP)—University of Tennessee officials estimated today that 10,000 ex-GI farm youths in Tennessee will particiate next year in the "on the farm" training program sponsored by the State Education Department and the university.

To train teachers for the farm veteran classes, the university will sponsor short courses next month at Columbia, Jackson, Dayton and Jonesboro. More than 300 teachers who have attended these classes already are working throughout the state.

The program, designed to train farm youths in the latest scientific methods of farming, includes 150 hours of instruction and 96 hours of supervision on the farm per year, according to Prof. J. B. Kirkland, head of the university agrieultural education department.

The program is fintnced by the Veterans Administration and enrollees receive subsistence pay under the GI Bill of Rights.

Negro Cotton Farmers

(Continued From Page 1)

shoots or slips for planting his crop. Then he carefully prepared one acre which he planned to devote to sweetpotatoes. To insure adequate nourishment for his potato slips when planted, he applied the recommended quantity of fertilizer.

From his 18-bushel seedbed he not only got enough slips for his acre. but also had enough extra slips to sell $65.00 worth. And at harvesting time last fall he dug 220 bushels off his acre, sold 145 bushels at $2.50 per bushel, and saved 75 bushels for home use for this year's seedbed. Altogether, Farmer Easley grossed $427.50 off a single acre of potatoes..

But this is not the whole story. On another acre he planted sugarcane. From it he produced 300 gallons of syrup. Up to now he has sold 150 gallons for $225, and still has plenty for home use and more for sale. Mr. Easley estimates that he will sell at least another $200 worth. Thus, from an acre of sugarcane and an acre of sweetpotatoes he is grossing over $800. "Not bad for a couple of sideline crops," says Dr. Otis, "and what's more, all of his cotton was clear money—didn't owe a dime on it at ginning time."

Increased Population Demands Soil Saving

Steadily increasing populations in the United States and in the world that must be fed from the land together with new industrial pressures that require redoubled care of the Nation's soil resources were described by Hugh H. Bennett chief of Soil Conservation Service of the U. S. Department of Agriculture, at the recent annual meeting of the American Political Science Assoeiation in Cleveland, Ohio.

"These needs already are exerting themselves on the world's supply of productive land," Dr. Bennett warned, "and will continue to do so with such force as to challenge our utmost technological capacity. We cannot afford to ignore the relationship between the land and our smokestacks. The productive land out of which these organic raw materials are produced is limited, just as definitely as are the supplies of minerals which we dug out of the ground. And we cannot stockpile soil in the way we can tin, tungston, lead, and uranium."

He pointed to estimates that this county's farms supply the raw materials for between two-fifths and two-thirds of industry's needs, and said the United States meanwhile is approaching the point where it will have little more than the 2 1-2 acres of reasonably good land which nutritionists consider necessary for an adequate diet per person.

"Therefore," he emphasized, "we are faced with the problem of using our productive land efficiently if government, society, and mankind are to survive.

Nothing short of acre-by-acre application of all practical measures of proved efficiency will give permanent, practical soil conservation, he insisted and maintained the productivity of farmland while in use. There can be no shortcuts or panaceas ____Predicting that the United States will make a tremendous effort in soil conservation" during the next 20 years, he estimated the cost of doing the conservation job at only a fraction of the cost of not doing it, and proposed an 8 point program for doing it:

1. An acceleration of the soil and water conservation program thru soil conservation districts, on the basis of the needs and eapabilities of the land.

2. The drainage of some 30 million aeres of good land.

3. The The rehabilitation, development, and better utilization of land and water resources on approximately 12 million acres, largely in sub-humid areas.

4. Purchase by states, soil conservation districts, or the federal government, of lands in hazardous areas which are in acute need of protection by soil and water conservation, especially where proper treatment cannot be given by individual farmers.

5. Quick completion of a land capability survey of all the farm lands of the country.

6. A broadened educational program to acquaint children and adults alike with the importance, condition and needs of their basic agricultural resources.

7. The initiation of scientific investigations, on a comprehensive basis into the relationships between soil health—with particular emphasis on the effects of erosion—and human health and nutrition.

8. Improvement of the Nation's range and pasture lands through increased knowledge and (application) of grass and livestock management.

Conservation Helps Farm Owner To Hold On To His Land

By adopting sound soil conservation practices to stop his topsoil from washing away, Earl Covington a N. Carolina colored farmer who has climbed up from sharecropping to owners has found a way to hold on to his farm reports Soil Conservation Service of the U. S. Department of Agriculture.

In 1941 the Farmers Home Administration made it possible for Farmers Covington to start buying a 187-acre farm. The outlook seemed a lot brighter to Mr. Covington than during the time he worked for $10 a month and rations, or the 18 years he sharecropped, but because a good part of his land had been cotton farmed almost to death and the rest of it was washing down the slopes into a creek, he was still awakened out of his sleep sometimes by a nightmare of slipping back into tenacy.

One day at the suggestion of his FHA supervisor, his problem was taken up with the Brown Creek Soil Conservation District. A plan was made for his farm. Some of the steepest land was taken out of cultivation altogether, 18 acres of slope areas were seeded to sericea lespedeza—a hay crop. On other parts of Mr. Covington's farm, regular rotations were started on all crop land, terraces were built, and rows were laid off on the eontour. Results? Yields improved.

Last year his cotton yield was up from 135 to 450 pounds of lint cotton per acre; and he was getting enough from his sericea lespedeza seed alone to meet the notes on his farm. Farmer Covington says he feels more secure now than he has ever felt before. With the fear of losing his farm gone, he even pinched off a part of his "rainy day" savings last year and bought a few extra nice Christmas presents for his family.

Dr. H. H. Bennett, chief of the USDA Soil Conservation Service, points out this his divison expects to do twce as much work this fiscal year as last. This would mean the establishment of combined soil and water conservation practices on more than 30 million acres of farm land by June 30, which would bring our total treated acreage up to 115 million.

falling eaglet and bears him up to a place of rest. Sometimes in our experiences, we may feel that God is not near, but he is just near enough to catch us when we have done our best but have not reached our goal. He lets us rest but makes us try again and again until we develop weakness into strength.

A woman's promise to be on time carries a lot of wait.—Reader's Digest.

Cow 'Blankets' Aid Milk Output, Expert Believes

Chicago, Dec. 23—(IP)—Cows wearing rubber sponge blankets saturated with water to keep them cool in hot weather are expected to produee more and better milk than naked cows, a dairy expert said today.

While cows and other farm animals can keep themselves warm in cold weather they cannot throw off heat as the temperature rises, according to Dr. Samuel Brody, professor of dairy husbandry at the University of Missouri.

Speaking at a conference of the American Society of Agricultural Engineers, Brody said the decreased value of cows, hens and horses in hot weather will be studied at a climatic laboratory being completed on the university's Columbia, Mo. campus.

There are two principal ways the problem might be met, Brody suggested. One is to devise mechanical aids, such as the rubber cow blanket. The other is to find chemical agents which might be injected into cows to keep their temperature down.

Rubber blankets already have been tried, he said, and will be used in further experiments.

Guard Against Cattle Grub, Expert Urges

Cattle men, both beef and dairy, were cautioned this week by W. P. Tyrrell, assistant extension animal husbandman, to be on guard against the cattle grub which annually cost livestock growers in Tennessee thousands of dollars.

The losses come through reduced cattle weights, reduction in milk produetion, and damaged hides—all caused by the grub as it burrows its way from the rear legs to the top of the animal's back.

Tyrrell said the only time the insect ean be controlled with any success is after the bumps appear on the back of the animal. It was pointed out by the livestock specialist that the bumps, which are usually about the size of a bird's egg, containing the grub will begin to appear within the next few weeks. "Shortly afterward is the time for the first treatment of a one to five per cent rotenone dust," he said. Two additional treatments about 30 days apart should follow.

The rotenone dust when properly applied to the animal's back will not only destroy the grubs but will also kill any lice that might be present.

A number of home remedies that have been used for years are of no value in controlling the insect, among which is the sprinkling of salt on the cow's back. Many will argue that the salt and other remedies will kill the grub because within a few days after the salt is applied the lumps will disappear. The fact is the grub works itself out of the animal's back, falls to the ground and develops into a fly. The possibility of getting enough salt in the small opening to destroy the grubs is very slight, aceording to Tyrrell.

"We have taken the grub in the cow's back for granted too long already and unless there is a eoncentrated effort to control it the losses will continue to mount he said. The cost of the poison dust to kill the insect is very slight as compared to the losses caused by it.

TO MEASURE GRAIN MOISTURE

Minneapolis — (AP) Minneapolis-Honeywell Regulator Co., has developed an electrical device for measuring the moisture content of grain. When perfected, it will be important to grain processors and to elevators.

Luxuries Vs Necessities

An authority on large-scale merchandising recently made this sage observtion: "At the end of the first world war consumers seemed to have the money to purchase all the luxuries and then they complained they could not afford the necessities. That seems to be the situation today." He cites the case of a woman who recently bought a very expensive fur coat—and then complained bitterly at an increase in the price of soap which could not add more than five dollars a year to her living expenses.

There are signs that this "silk shirt" attitude is diminishing. A good many of the "anything-at-any-price" buyers have finally run out of cash, and others are beginning to realize that spendthrift policies are not good for either individuals or the nation. And it is to the credit of retail merchandising that, for the most part, it is not trying to encourage reckless spending—nor is it attempting to profit unduly by charging all the traffic will bear.

The chain stores long ago announced a policy of holding prices to the lowest possible level, whether or not governmental controls existed. The majority of independent stores have pursued a similar policy. And the inexorable laws of competition are taking care of the occasional merchant who wants to exploit the unwary purchaser. Under the competitive system, prices find their own natural level, whether that level he high or low. In any event, it will be the level established by the costs and conditions of the time.

The Chimer Of Lower Rates

The electric rates charged consumers in the City and County of Sacramento, California, should be reduced by $228,000 per year. That is the sum which the private utility serving the region paid in property taxes—and which was lost on December 31 when a tax-exempt municipal utility district took over the taxpaying private company.

In the words of the Sacramento Union, the private utility in question, "served the district well for 50 years, and is entitled to its collective thanks." But despite that, the people of Sacramento decided to try an experiment in socialization and one of their oldest, largest and most dependable taxpayers was chosen for the sacrifice.

Now experience will prove whether the operators of the municipal district have the experience and the know-how that is needed to properly operate so large a venture. Time and time again rates have not been reduced. And when they are reduced, the total saved is almost invariably substantially less than the tax loss to the community that results when taxpaying private enterprise goes out, and socialized tax-empt enterprise comes in.

The people of Sacramento may be optimistic as to the future of their municipal system. But they shouldn't be surprised if it turns out to be an expensive luxury when all costs, including taxes, are figured.

Cumberland Newest Crop Sweet Peppers

Crossville, Tenn., Dec. 23.—(Special)—Practically a new crop for Cumberland County was successfully grown, harvested and marketed this year, it being sweet pepper. The average price per acre realized by Cumberland County sweet pepper growers was $250. As this was the first year the farmers ever grew sweet pepper for commercial purposes, they feel they can grew the crop more profitably next year.

The highest yield was that of Roy Williams. He grew 16,800 pounds on sevne-tenths of an acre, for which he received $376.48, and he estimated there was more than a ton of pepper on the plants when they were killed by frost. On an acre basis, Williams would have produced 12 tons of sweet pepper. All of this year's growers are enthusiastic over their first year's success with the new crop and say they will grow a larger acreage next year.

The Hard Truth

The Saturday Evening Post recently published an editorial which should be read and remembered by every coal miner in the United States. Entitled, "Will Coal Price Itself Out of the Market?" it deals with a simple and incontrovertible economic truth which Mr. Lewis' followers seem to have forgotten.

The Post says, "Demand for any commodity for which substitutes exist can never be considered fixed or taken for granted." Coal is our primary source of industrial energy—but other sources, such as oil and natural gas, can be employed for many of the same purposes. Coal, in other words, is a competitive commodity—and it must seek its markets in the face of growing competition.

The Post cites a few thought-provoking statistics. Not so many years ago, all railroad locomotives were coal fired. During 1945, on the other hand, the Class I railways installed 534 diesel and electric locomotives—as against only 109 powered with steam. A similar situation exists in the field of home seating. In 1940, 39 per cent of all FHA-financed homes used coal. By comparison, of the first 629,000 permits isued for home building under the veterans priority plan, but 27 per cent specified the use of coal—and the balance specified other fuels.

Some of these changes are evolutionary in nature, and to be expected. What they do, however, is to point to the possible economic consequences to an industry when the cost of producing its product rises disproportionately. To quote the Post once more, "It is certainly no service to the miners to make extravagant demands which can only result in such drastic increases in cost as to price coal out of its market and coal miners out of Jobs."

The primary interest of labor, in any field, is the preservation of profitable, progressive industry capable of providing continuous employment. Beyond a certain point, higher wages can only result from increased production or more efficient production—if the industry in question is to survive. That is the hard truth, difficult as it may be for some labor leaders to accept.

Competitive Economy

The retail price of any commodity must be largely determined by the operating costs of the store making the sale. Anything which adds to those costs unnecessarily imposes a direct and avoidable financial burden on the consumer.

An example of this is the chain-store tax. We haven't heard a great deal about these class levies in recent years, but they exist in a number of states, and in some cases are assessed by municipalities. Some of them are based on the stores' gross volume of business, while others are based on the number of outlets operated by a retail system. In either event, they represent an artificial cost stimulant which, in the long run, must be passed along to the consumer. A store, like any other enterprise, has only one way of meeting its expenses and earning a profit—and that way is by pricing its goods in accordance with its costs.

Competition in retailing, as in anything else, is a major protection for the consumer. Over the generations, that kind of competition has developed an amazingly efficient and flexible merchandising system. The once-expressed fear that large, multiple-unit chain companies would either absorb or destroy the small independent merchant was proved groundless long ago. The independent has held and improved his position—which is a well-earned tribute to his resourcefulness and his price and service policies.

We must look to retail competition now to help in holding prices to as low a level as the conditions of the present and future will permit. We must look to it also to act as the consumers' ally in improving the quality and dependability of goods. The role of the merchant, always important, grows in significance. Good merchants, large and small, welcome the revitalization of a competitive economy.

Retailers Seek Quality

In an editorial on the retail price situation, in which it advised its readers not to look for any strong downward trend, the Portland Oregonian said: "Any real reduction in retail prices will come through the transference of savings in manu facturing—by greater efficiency and higher production, since there is no prospect of wage reduction."

Competition, in the traditional American sense of the word, pretty largely vanished during the war. Ceiling prices were also "basement" prices, in that all producers and retailers had to work within the strict framework of OPA controls. Goods were scarce at best, and many items disappeared completely, due to the channeling of raw materials to the insatiable maw of the war machine. Low inventories precluded the possibility of seasonal and year end sales on the prewar scale.

But competition is regaining its old vigor, and that in itself is a guarantee that the consumer will get what he wants at the lowest price possible. Again, consumer discrimination is a wholesome sign—it indicates that the anything-at-any-price era, with its strong inflationary pressure, is drawing to a close. Finally, the growing insistence on the part of retailers for better quality goods, in all price brackets, is a great aid to consumers who are sick of the shoddy and the unreliable. The stores you patronize are eager to return to the old, competitive basis of doing business, and conditions are steadily improving.

In Case Of Fire

It is evident that the terrible death toll in the recent hotel fires make revision of many municipal building codes mandatory. Structural changes must be effected to prevent the spread if fire from floor to floor and through area-ways. In the meantime, the National Board of Fire underwriters repeats a set of fire safety rules for hotel guests which would have saved scores of lives in Chicago, Atlanta and elsewhere had they been followed. Here they are:

1. Upon reaching your room, locate all means of emergeney exit.
2. Do not smoke in bed—this is one of the most prolific causes of fire.
3. If you detect smoke or any evidence of fire, immediately inform the desk.
4. Close your transom, and plan what you will do if fire strikes.
5. In the event of fire, do not open your door if it feels hot to the touch. If it is not hot, open it slightly, bracing it with your foot. Then, if the hallway is safe, use the planned exit.
6. If the hallway is not safe, keep the door closed, and stop up openings and cracks with wet towels, sheets, blankets, matresses, etc.
7. Open the window slightly and remain near it. Don't get hysterical. The fire department will rescue you—wait for it.

The essence of this procedure is to avoid the creation of drafts that fan fire. People who followed similar techniques in the hotel fires lived—while people in adjoining rooms who let panic rule them died. Remember these rules. There is a very real possibility that someday they will save your life.

72,000 Seedlings Planted In Alabama

Huntsville, Ala., Jan. 20.—(Special)—Approximately 72,000 pine and locust seedlings have been distributed in a district composed of five counties in north Alabama. The seedlings were obtained from the TVA nursery at Muscle Shoals to supply Madison, Marshall, Etowah, Jackson and DeKalb Counties.

A room-seeking young resident of St. Catherines, Ont., speedily solved his problem with the following advertisement: "Having trouble buying soap flakes, lard or bacon? Young man working in large grocery establishment, requires room, breakfast and dinner six days a week, private home."—Christian Science Monitor.

The Atlanta Fire

The ghastly hotel fire in Atlanta was the worst of a serious of similar disasters. It was followed the next day by a fire in a Saskatoon, Canada, hotel which took eleven lives, and differed from the Atlanta holocaust only in degree.

The causes of the recent hotel burnings are not completely known. In all cases, the fires started at night or in the early morning and some times elapsed before alarms were sent in and fire fighters arrived on the scene. And in all cases the fires spread with almost incredible rapidity and fire fighting equipment in the buildings was either unused or was completely inadequate.

It seems certain that in some instances local fire ordinances were either unenforced, or outmoded. For example, there seems to have been no adequate provision for shutting off areaways and thus controlling the pressures generated by fire. Inside fire escapes, stairways and elevator shafts became chimneys through which fire and smoke raged unchecked throughout a whole building, almost instantly.

Every community should now take immediate steps to assure if possible that more such horrible fires will not occur. The first step is to modernization and stiffening of codes concerning building, and the correction of fire hazards in existing buildings. Sprinkler systems and fire doors which are essential in warehouses and factories, are a hundred times more important in hotels and buildings housing large numbers of people. The second step in constant inspections of public premises and rigid enforcement of the law. It is too late to save those who died horribly in Atlanta and Saskatoon. What we can do is to prevent such sacrifices to carelessness and indifference in the future.

Plan Now

To join the artificial dairy breeding association in your county and eliminate the expense and hazard of keeping a bull. It is estimated that at least 90 per cent of the dairymen could profit through such an organization.

To repair and replace all needed equipment for the brooder house before purchasing baby chicks.

To sell old hens as they go out of production, and replace them with early pullets.

To rub your hand across the back of each cow, beef or dairy, on your farm. If lumps are found treat the animal's back with a five per cent selution of rotenone.

To be present during lambing season. Each ewe should be provided with individual quarters and well bedded. A pen four feet square will be adequate.

To feed livestock good hay and save the low grade hay for spring when the grass begins to grow. Many farmers make a mistake by feeding a poor grade of hay when there is no green feed to supplement it.

To provide warm feed as well as warm water for the laying hens during the cold days that are sure to come.

To have a supply of rotenone dust available when the first bumps, caused by grubs, appear on the cow's back.

To place orders for baby chicks to be delivered in late February or early March if a flock of laying pullets is desired next fall and winter.

To supply all livestock with plenty of fresh water during these cold days, but without ice.

To keep records on next year's farm operations. There is nothing more valuable when filing an income return than an actual record—something many farmers don't keep.

To continue the fight against rats. Even though the supply of grain is far in excess of that in the past few years there still isn't enough to "feed" rats.

To conserve grain and hay by feeding in a clean, dry place.

To reduce the number of grubs in the back of your cattle next year by treating the cows' backs with a five percent rotenone dust. At least three treatments should be given to control the insect.

One Million More Bureaucrats

In a recent magazine article, Senator Robert A. Taft, who will be among the leaders of the next Congress, strongly described the dangers inherent in the pending Wagner - Murray - Dingell public health bill.

The measure would result in the creation of a fund of three to five billion dollars a year—some of which would be taken out of workers' earnings in the form of another social security tax and some of which would be provided by the Treasury. As a result, he wrote, "The political patronage . . . would be tremendous. To operate the machinery required would take anywhere from 250.000 to 1,500,000 employes—in addition to the medical profession. More than 50,000,000 cases would have to be ehecked every year as a basis for payment and statistical information. Federal bureaus of this nature are notoriously inefficient, expensive and political. The medical bureau would have to send investigators into every home. It is hard to conceive any function which would touch more closely the lives of our 140,000,000 people . . . . I cannot conceive a measure which would more surely lead to an all-powerful central government than Federal compulsory health insurance."

Mr. Taft commented on the claim that medical service in this country is inadequate, and concluded: "The health of the United States as a whole is as good as that of any nation and better than that of most." He conceded the need of additional medical aid, by government, to people who honestly cannot pay for it, and is sponsoring a bill to that effect. And he made this telling point: "The fundamental issue is whether the government shall look after the indigent or whether it shall look after the entire population."

The Wagner-Murray-Dingell bill is not designed to help the needy alone. It is, on the other hand, designed to regiment medicine, and to take us a long step toward state medicine, at an enormous cost both in coin and in our basic liberties. It should be defeated.

President Patterson Give Facts On Lynchings

Tuskegee Institute, Ala.—I send you the following information concerning lynchings for the year 1946. I find according to the records compiled in the Department of Records and Research of Tuskegee Institute that there were 6 persons lynched in 1946.

This is 5 more than the number 1 for 1945; 4 more than the number 2 for the year 1944; 3 more than the number 3 for the year 1943. 1 more than the number 5 for the year 1942.

There are 4 borderline cases which are not included in the total number of lynchings for 1946 because to date sufficient evidence concerning them has not been obtained.

There were at least 17 instances in which lynchings were prevented. 14 of these were by officers of the law and 3 were by persons not connected with the law. 16 of these instances were in the Southern States and 1 was in the Northern States. A total of 22 persons, 21 Negroes and 1 white person, were thus saved from death at the hands of mobs.

All of the 6 persons lynched were Negroes. The offences charged were: stealing a saddle, 1 (two other persons later confessed this crime); stabbing a man, 1; no charge, 3 (were in automobile with one of the victims); attempting to break into a house, 1 (jailed, but later released).

The States in which lynchings occurred and the number in each State are as follows: Mississippi, 1; Georgia, 4; Louisiana,* 1.

Very truly yours,
F. W. Patterson, Pres.

* Another victim of the same mob later regained consciousness and escaped.

(Housewife to vaccum salesman:) "You might try the people next door, we use theirs and its terrible!"

Earthworm Invaluable In Aiding Farm Lands

By Paul F. Ellis

Boston, Jan. 6.—(UP)—The earthworm is one of man's best friends.

In addition to being good fish bait the earthworm's benefit to man, Henry Hopp and Homer T. Hopkins of the U. S. Soil Conservation Service believe, is to make the farm lands more productive. That means more and better farm crops.

These two men, who made a report of new experiments with earthworms at the 113th annual meeting of the American Association for the Advancement of Scienee, were somewhat perturbed that science has done little about this field.

"The subject of earthworms is a full-grown challenge to the soil scientist," they said. "It is time to take stock of where we stand. First, it must be admitted that we do not know truly and finally the extent to which earthworms promote the fertility of soil. Second, we do not know if it is possible to increase the earthworm population by practieal farming methods. Third, there is enough 'smoke,' experimentally and observationally, to indicate there must be some degree of 'fire' to this earthworm idea."

These two experts on soil conservation told of experiments with earthworms in crocks filled with earth and in which plants were grown.

It was found that the lifetime of an earthworm is very short, but that the worm before death had left eggs which hatched, bringing forth a new crop of baby earthworms. The decaying remains of the dead worms fertilized the soil, and in each instance there was an increase in plant production.

The tests showed that the death of the earthworms in the soil resulted in a release of nitrate and ammonia.

"Prior to their death, the earthworms laid eggs, from which a new generation hatched," they said "Therefore, the eontinued presence of earthworms in soil may increase yield if conditions are maintained that permit a normal, continued cycle of birth and death in the earthworm population.

"Sustaining their cycle of birth and death appears, so far, to be the key to using earthworms for increasing crop production."

They admitted that more information is needed on how to cultivate the earthworms—since it is estimated that the cold winters destroy about 75 per cent of the worm population.

Negro Farmers Keep Pace

Negro farmers are keeping pace in the Nation's agricultural production program, declares M. L. Wilson, director of Extension Service in his 1945 annual report to Seeretary of Agriculture Clinton P. Anderson.

The director points out that seven million rural Negro Americans are out to produce their share of country's food and fiber. Through sound soil conservation practiees they inereased their production of corn, peanuts, sugarcane, rice, and sweetpotatoes during the year following VJDay, he says. Also, they improved their pastures to care for inereasing numbers of hogs, beef, and dairy cattle.

Direetor Wilson says that through out the South, Negro extension workers—now numbering over 800—placed emphasis on the use of disease-free seed and plants, a range of plantings that would produce during all seasons, proper methods of canning, adequate storage space for cured meats, sweetpotatoes, and canned foods.

Referring to the sale of surplus products, the director states that colored farm people organized several curb markets on which they sold garden products, poultry, eggs, cured meats, hand-made rugs, quilts and spreads. He says that through increased produetion and the addition of sideline crops, thousands of eolored farm families are suceeeding in their efforts toward a better rural life.

DONKEY CALLS COW HOME

Sumas, Wash.—(IP)—A donkey named Moak on the farm of Henry Vermeer is useful at cow calling time. Moak lets out a lusty bray and the cows come home.

Enough milk is produced annually in America to fill a river 3000 miles long 40 feet wide and 3 feet deep. If all the milk produced in the United States in 1945 had been put in quart bottles side by side they would extend almost 150 times around the earth.

"As a farmer sows so shall he reap," was the attitude of Commissioner of Agriculture O. E. Van Cleave recently when he authorized the expenditure of $3,200 for the installation of new seed germinators in the state seed laboratory in an effort to safeguard the seed purchases of Tennessee farmers.

The new germinators replace the outdated ones that have been used or several years, according to Frank H. Spanier, state seed analyst.

Spanier, who has served the State Department of Agriculture as seed analyst for the past 19 years, said that the new germinators were superior to all others in the world. They are a combination of all the good points of all previous ones, he said. The seed analyst said that after doing nothing except testing field crop seed for two decades he knew the type of germinators necessary to accomplish the work required under the Tennessee seed laws. It was these ideas in the hands of the manufacturer that resulted in the new equipment. The ideas were not new with Spanier. On Various occasions he had attempted to sell the commissioners of agriculture on the need for such equipment but met with no success until the present commissioner took office. "We will now be able to do a more efficient job in our effort to protect the farmers against inferior seed," he said.

The work of the seed testing laboratory has increased almost 500 per cent since the passing of the new seed law by the state legislature in 1939 which required that all seed sold in the state be labeled with a tag showing not only purity, germination and amount of weed seed present, but the amount of inert matter, origin, amount of hard seed, other crop seed and date tested.

"We have found that in most cases seed dealers who have been in the business for a number of years are anxious to provide their customers with desirable seed," Spanier said. "It is the "fly by night" truckers and "mushroom" seed dealers that cause the most trouble."

The only seed samples that are checked in the state laboratory are those taken by the inspectors of the department. However, any farmer desiring to have his seed analyzed can do so by requesting this service of the department. Charges are very small, according to the seed analyst.

Van Cleave said it is the desire of the department of agriculture to do everything possible to provide those who purchase seed with information which described the seed purchased, and in his opinion much progress along that line had been made in the last 10 to 15 years.

"We boast a lot about the progress we have made in yields of field crops, giving most of the credit to fertilizer and soil and moisture conservation practices, but if the truth became known I believe we would find that improved seed has played a major role in this increase," the commissioner said.

He pointed out that too many farmers still purchase seed only on germination basis, not taking into consideration purity, variety and other important factors.

The commissioner said crop improvement associations have made great contributions in the field of seed production in that standards for quality seed in the associations are superior to those in the seed laws of most states. Through concentrated efforts of all concerned the quality of seed used, on which the farmer stakes his whole year's work, will be improved, Van Cleave said.

Farms Of Nonwhite Farm Operators, Number Of Farms, Land In Farms, Cropland Harvested And Value Of Land And Buildings, By Tenure: Censuses Of 1945 And 1940

Preliminary figures: Virginia

Data from the 1945 Census of Agriculture, released by Director J. C. Capt of the Bureau of the Census, indicate that war stimulated factors caused only a slight decline in the total number of farms operated by nonwhite farm operators in the State of Virginia. Between April 1, 1940, and January 1, 1945, the total number of nonwhite-operated farms declined from 35,090 to 34,955, or somewhat less than one-half of one percent (0.4 percent) This extremely small decrease seems to imply that throughout the war, a high proportion of the nonwhite farm operators in the State of Virginia found farming more attraetive than the opportunities for employment in the Hampton Roads area and other industrial centers engaged in wartime production.

That this inference is probably true is indieated not only by the exceptionally good market for farm products during the war, but also by the large percentage of owners (63.4 percent) and the comparatively small percentage of croppers (16.8 percent) in the State of Virginia in 1940.

Notwithstanding the almost negligible decrease in the total number of farms, there were significant changes in the number of farms operated by owners and tenants. On one hand, the number of owner farms increased from 22,250 to 23,109, or 3.9 percent, while on the other hand, the number of tenant farms decreased from 12,804 to 11,801, or 7.8 percent.

The rise in the number of owner farms reflects increases in farm income. A considerable proportion of the decline in tenant farms is undoubtedly accounted for by the increase in the number of farms operated by owners, migration from rural-farm areas, and the induction of males of military age into the armed forces.

Land in farms of nonwhite farm operators grew from 1,782,602 acres on April 1, 1940, to 1,851,041 acres on January 1, 1945. The increase of 68,439 acres of land in farms between 1940 and 1945 reflects a gain of 96,017 acres (9.5 percent) for farms of owners, a gain of 8,042 acres (69.7 percent) for farms operated by managers, and a loss of 35,620 acres (4.7 percent) for farms of tenants.

The total number of acres of land from which cultivated crops were harvested in 1944 (495,789) exceeds the total number of acres of land from which cultivated crops were harvested in 1939 (470,481) by 25,308 acres (5.4 percent). For owners, the increase in cropland harvested was 22,932 acres, or nearly 10 times the eorresponding increase for managers and tenants (2,376 acres).

As compared with 1940, the total value of land and buildings of nonwhite-operated farms in the State of Virginia in 1945 ($69,372,082) represents an increase of $19,288,881. Sixty-seven and three-tenths percent of the increase in value was for owner farms, 3.5 percent was for farms operated by managers, and 29.2 percent was for tenant farms.

Each of the 100 counties in the State of Virginia, except Arlington, Buchanan, and Dickerson, had one or more nonwhite farm operators in 1945. The following 8 counties however, had somewhat more than one-third (33.7 percent) of the farms: Brunswick, Charlotte, Dinwiddie, Halifax, Louise, Mecklenburg, Pittsylvania, and Southhampton. These counties had 57.0 percent of all tenant farms, 37.3 percent of all land in farms, 38.4 percent of the cropland harvested, and 33.8 percent of the total value of land and buildings.

In 85 counties, owner farms outnumbered tenant farms, and in 12 counties tenant farms outnumbered owner farms. The latter group of counties includes Accomack, Appomattox, Greenville, Halifax, Lee, Mecklenburg, Nansemond, Northampton, Pittsylvania, Southampton, Sussex, and Wise. These counties had 7,348 tenant farms, or slightly more than three-fifths (62.3 percent), of all tenant farms in the State of Virginia.

Dairying Is Among State's Top Industries

By Robert Battle

From an industry of minor importance in 1914, dairying in Tennessee has advanced until today it has taken its place among Tennessee's leading industries with milk production during 1946 reaching to the $100,000,000 mark—the highest in state history.

As an example of how Tennessee has progressed in the by-product division of milk production, the state now ranks sixth in the nation in the production of cheese, according to the latest report of the State Department of Agriculture. It is pointed out that the state leads over all other southern states in cheese production by a wide margin.

The 610,000 dairy cattle in Tennessee last year produced an estimated $46,000,000 cash farm income from sale of milk and cream, with more than that amount used by the farm families of the state. The total value of milk produced and dairy cattle sold is now approximately 100 million dollars annually, the Agriculture Department has reported.

Statistics show that of the national farm consumption of milk, cream and butter, 58 per cent appears on the tables of the farm families of the 16 southern states, and of butter churned on the nation's farms for home use, the southern farm families eat some 75 per cent.

Tennessee milk averages 4.4 per cent of butterfat, a figure not equalled by any northern state except Oregon, whose foundation dairy herds traee back to Tennessee, the departments reported.

The output of creamery butter, with a beginning of about 300,000 pounds, reached a peak of more than 22,000.000 pounds since the war came to an end. The state is also a leader in evaporated milk production, with an annual output of over 100,000,000 pounds.

The department reports that with the people of the state looking more and more to the dairy farmer that the production of dairy products in the near future will take a big increase as the demands will try to be met.

It is said that one of the leading factors in the growth of the dairy industry has been the establishment of permanent markets for milk and cream throughout the state—a project pioneered and promoted by the University of Tennessee Extension Service.

Among the important factors held responsible for the advancement of the industry have been improved breeding and feeding practices, increased acreages of improved pastures and good legume hay, and the establishment in recent years of additional markets such as condenseries and cheese factories.

Ice Cream—the product brought back by many farm boys—is a leading Tennessee product with an output of some 10,000,000 gallons, it is reported.

Among advancements made recently in the dairy industry have been the initiation of the dairy cattle shows and sales where cattle free from disease have been sold to make many of the farms better.

The cattle clubs of the state have offered to sell to 4-H Club members and Future Farmers of America, outstanding calves to give the club boys and girls a good beginning in dairy work.

Tests Show Deficiencies In Soils

more than 55 per cent of all soil samples analyzed at the University of Tennessee Soil Testing Laboratory here show a deficiency in lime. 50 per cent show a deficiency in phosphate and 40 per cent are deficient in potash, Bruce W. Hatcher, assistant extension agronomist, said today after summarizing the analysis on 4,000 samples.

Soil containing elements sufficient to produce alfalfa was the standard on which the summary was made.

"These figures may seem a bit high but had we run tests on samples from the same fields 10 years ago, before the concentrated lime and phosphate program was started by the AAA the picture would have been quite different," the soils expert said. "However at that time we probably would not have found so many samples showing a lack of potash," he continued.

There has been a rapid and continuous increase in the production of alfalfa, other legumes and hay crops that drain heavily on the supply of potash present in the soil, during the past few years. That, plus the fact an adequate supply of commercial potash has not been available to apply to the soil, has contributed largely to the present deficiency, Hatcher said.

It was found in making the summary that approximately 10 per cent of the soil samples contained an excess of lime—not enough to be harmful to a growing crop but more than is necessary for practical purposes. This condition has been brought about, Hatcher pointed out, by farmers applying many tons of lime without knowing whether it was needed.

The fact that a farmer has applied several hundred pounds of phosphate to a given acreage in the last year or so is not proof that the soil contains a sufficient amount of phosphate or desirable crop production. Many tons of phosphate have been applied to acid soil during the past few years—which means much of it has become "locked' in the soil and is not available for plant food, according to Hatcher. "One should always be sure the soil contains a sufficient amount of lime before applying phosphate," he said.

There is no doubt that farmers have become more appreciative of the value of commercial fertilizer. Proof of that fact is farmers in Tennessee have almost tripled their fertilizer purchases in the last three years.

Hatcher is of the opinion, however, that too many farmers still apply fertilizer to their crops by the old "guess work" method which he says is too expensive in many cases. He advises all farmers to make use of the soil testing laboratory which is located at 2321 West End Avenue here in Nashville and is sponsored by the University of Tennessee Agricultural Extension Service.

Since the laboratory was opened about three years ago more than 20,000 soil samples have been analyzed. The analysis along with recommendations as to the amount of fertilizer to use on the intended crop has been provided the farmer on each sample.

Butter Price High?

Speaking recently at a dairy industry gathering in Tacoma Washington, M. M. Boney, manager of the Whatcome County Dairymen's Association and a director of the American Dry Milk Institute, Inc., made this lucid comment on the price of butter:

"Historically, the price of a pound of butter is not far removed from the price of one hour of eommon labor, and on that basis, $1 per lb. of butter is not particularly out of line. It should be remembered however, that no farmer can produee a pound of butter with one-hour's work. It is rather an unfortunate situation when people have higher than wartime wage and still think they should have 50e butter.

Adequate Water Supply Essential To Produce Milk

Reminding farmers that dairy cattle need all the water they will drink in the winter as well as summer, L. S. Edwards of the UT Extension Service made the following statement this week as ice appeared in water troughs and on pends for the first time this winter: "Give dairy cows all the water they will drink if maximum production is expected, and this does not mean ice water."

Cows will not drink a sufficient amount if the temperature of the water is too low, any more than they will if it is too high, the dairy specialist said.

The fact that milk is approximately 88 per cent water is evidence enough that a dairy cow must have water to maintain production. "There are still dairymen who think all they need to do on a cold morning is to break the ice and the cows will drink all they want, which is probably true, but they will want very little," he said.

Edwards said that it will take good management of all dairy herds to meet the demand for both fluid milk and milk products during the next few months. Since water is by far the cheapest raw material necessary for milk production, there is no reason for milch cows not having an ample supply.

Farm Talk With Farm Folk

By Jesse Safley

For a number of years the world has been wondering whether conditions would ever be normal again. How often have we heard the remark, "things will never return to normal"? You have heard that expression many times, and so have we. The question which often enters our mind is—What do we consider a normal world in which to farm?

Most certainly we could not say there has been any period of time since many of us can remember that might be termed normal. We say that with certainty and with little, if any, fear or debate. Many are inclined to class the late thirties as a period of normal times because then they could buy almost anything they wanted, provided they had the money.

We question this belief because the nation was just beginning to heal from one of its worst depressions. Much of that healing power had been brought about by artificial means. Government aid along many lines of agricultural production had hastened that point and much of the production on our farms was controlled to prevent over-production. We will all agree such a program on the farms of America was not normal, at least then. We are becoming so accustomed to such things now, however, that within a decade or so we may consider it normal.

The early thirties and late twenties definitely were not normal because at that time the depression was at its worst. The period before that was the "boom" and short depression following World War I and, of course, just prior to that was the war itself. We cannot say that any of those times were normal farming periods. Then, of course, during the few years preceding World War I conditions were very unstable—just as they were in 1940 before we entered the last war.

Perhaps the only time in the first half of the 20th century that might be called normal was the period from 1900 to 1912 but as we remember history those were the years immediately following the Spanish-American war.

Should we decide that those years were normal for farming we wonder just how many of us would like to return to the conditions that existed then. At that time almost all farming was done solely by man and animal. Very little of what we call modern machinery had been invented, and there were none of the modern conveniences for the farm or home. We had no telephone system of much value to serve the farmers, no electricity, no radios, no automobiles, and the roads on which the farm folk had to travel were impassable at least some time during the year. The farmers received little help in the form of crop and weather reports. Marketing facilities were scarce and inadequate.

Where is the family that would like to do all its traveling in wagons and buggies or the dairyman who would swap his herd of pure bred cows for a herd of scrub grades? Both conditions were normal at one time. We have yet to find a farmer who has become accustomed to the use of electricity that would exchange it for the old methods of heat and light. No one would care to retreat to the time when there were no means of controlling the many insects and diseases which effect our farm production.

The fact of the matter is that every one of us would like to select all the good things of the present and call it normal.

"Normal is nothing more or less than dreams" on the part of all of us. We dream of the time when there are no daily hardships, when the things we buy are cheap and those things we have to sell demand a high price. When we think of the "good old days" we are likely to remember only the pleasant things and forget those that cause us worry. The reverse is more often true of the present; that is human nature.

However, we believe farm conditions are on the road to less hardships. For the past few years there has been a steady decline in farm population, causing many farms and farm homes to remain unoccupied. Those in search of faster, yet less stable gains, have moved to the cities and factory areas, but now the move is the other way. Many of those vacant homes, though in a rundown condition, are being occupied again—a move almost everyone predicted never would happen. We'll agree that officials who are supposed to know about such things will say that it is not happening yet . . . but just look about you. It may not be so noticeable now but as the months of 1947 pass it will become more evident. No doubt some of the present-day "back to the farm" movement is due to the numerous veterans who are participating in the farm training program, a fact many said would never come true.

Farmers were told, and many believed, that seasonal labor would never be available again on the farm. They were told to adjust their farm to the point that seasonal labor would no longer be needed—something that is next to impossible. This caused worry on the part of some, while others never took it seriously. We are among the group who believe seasonal labor will be available when needed, maybe not to the extent of the pre-war years but sufficient. We base our belief on the fact there have always been people who do not desire a full-time job and they often make their homes in the rural or semi-urban district where living expenses are less. For that reason they will be available for seasonal labor. That is just an example of the changes many thought would never take place.

If we were to base "normal times" on the period of time enjoyed by the greatest number of people, we predict the years ahead will be that time. We are optimistic enough to believe the next five to 10 years will be enjoyed by a greater percentage of the farm people than during any other single period. Not that we think they will have more money; in fact, they will in all probability have less. In spite of that, we believe there will be less reasons for worry and more reasons for happiness than ever before.

The Russians have always been vastly impressed with American know-how. One American mechanic who worked in a watch repair shop in Berlin said a Russian walked in with a clock under his arm and requested, "Please take this apart and make wrist watches out of it."

Good Sheep Management Is Stressed

This is the time of year when sheep producers must be on the alert if greatest possible returns are appreciated from their efforts. Paul P. Hite, sheep specialist of the Agricultural Extension Service, said today.

Most sheep producers have realized the importance of winter pasture in their sheep program, but there are those who still fail to appreciate the value of good management during extremely cold weather, the specialist said. He pointed out that many make a mistake by not supplementing the feed of flocks that are grazing on green pastures when the pastures are covered with snow or are in such condition that the animals will not graze them.

Flocks should be fed a good legume hay when not on the pasture or when the pasture becomes overgrazed, Hite said. He recommended that some grain be provided during that period also.

"Never feed sheep hay on the ground. When a sheep once steps on its feed, it will not eat that feed," Hite declared. He said all hay should be fed in a rack, not merely because the sheep will eat more but there is less waste.

Creep feeding of young lambs after they reach two weeks of age was advised. The feed should be nothing more than cracked corn mixed with a little brand or sweet feed. The lambs may eat only a small amount, especially if they are grazing on a good pasture, but that consumed will contribute toward rapid gains.

Though a large percentage of the ewes in Tennessee have lambed for this season those that haven't should receive good care. There can be profit in late lambs, Hite said.

Lincoln Farmer Finds Tool Shed Is Money Saver

Careful attention to the housing and repair of farm machinery during winter months is a time and money saver, according to Roy C. Beeler, Lincoln County farmer.

All machinery on the Beeler farm is kept in a 40 by 16-foot shed. Machinery can be found in this shed at all times, if not in use. When a piece of equipment is brought from the field used cylinder oil is spread over wearing parts to prevent rusting.

If a piece of machinery is damaged in the field it goes to the farm shop and is repaired on the first rainy day before going to the tool shed. During the winter months, Beeler goes over all his machinery and sees that it is in good working order before the busy season starts in the spring, according to Ray Ward, assistant county agent.

A good farm shop is located near the house, equipped for all minor repairs. The shop is lighted so that repairs can be made at night during the rush season. A small electric motor has been added to operate grindstone, emery wheel, sickle grinder, etc. Beeler is a TVA demonstration farmer.

Machine To Pick Potatoes Found

Washington —(IP)—The Agriculture Department says potato combines are just around the corner—thanks to a machine that can tell the difference between a spud and a rock.

The department said the Maine state extension service reports that a new machine used in Penobscot County this fall picked and bagged potatoes at little more than half the cost of hand-picking.

The machine overcomes the chief difficulty of previous devices which were unable to differentiate between potatoes and rocks. It passes the potatoes over a table buffeted by strong blast of air. The blast rolls the potatoes off into barrels. The heavier rocks are dumped back in the field.

The Helping Hand Of America

The responsibilities that came to the United States as a result of victory in the war are not fully known to the American people. The history making events that are taking place in Europe and the Far East naturally reach the headlines—but many another important job is being accomplished in obscurity.

An example of this is found in the Pacific islands. The Marshall group, which is typical, belonged to Germany until 1914. Then Japan, as one of our Allies in World War I, seized the islands, and her authority was legalized by a League of Nations mandate in 1922. Japan held the islands, using many of them as naval and air bases, until we freed them near the close of World War II.

Thus, purely as a consequence of war, the problems of thousands of natives living on scores of islands became our problems. And it is pleasant to report that the United States Navy, which is the administrative agency, is taking these problems very seriously.

The Navy is training officers in the arts of military government. It is making aggressive efforts to reestablish a system of adequate education. It is paying particular attention to health and sanitation. It is attempting to revitalize what little industry and commerce the islands are capable of maintaining. Its purpose, in sum, is to assist the inhabitants to stand on their own feet.

This is no simple task. An immense amount of work is being done by the Navy. Thus, the hand of America reaches out to tiny islands whose very names are unknown to all but a few persons.

What The Public Thinks

Anyone who has ever been associated with a public opinion survey knows that a considerable minority—and often the majority—of the people have conceptions of industrial practices which are completely at variance with the truth. The danger that an uninformed public presents to our institutions and our economic structure is evident. The man doesn't know the truth is easy prey for the demagogue.

The oil industry has come in for its share of misconceptions. For example, it seems to be rather widely believed that the industry is insufficiently competitive, and verges on monopoly. The weight of actual evidence, on the other hand runs directly contrary to that theory.

The easiest guage of whether aggressive competition exists within an industry is price. Here oil has an exceptional record. Exclusive of taxes, over which the industry has no control, the price of gasoline is about half what it was 20 years ago. On top of that, the quality of gasoline sold today is immeasurably superior. Does that look as if monoply was the rule?

Still another guage is progress—a monoply, which fears no competition, does not strain itself to go ahead. Here again oil is outstanding. Research and discovery heave added enormously to our oil reserves. They have given us infinitely improved lubricants and other by products. This is the direct result of aggressive competition between companies seeking to broaden their market and achieve public acceptance for what they sell.

Competition is the cornerstone of the American industrial system. And it is one reason for our world leadership in the economic sphere.

Negro Tenant Wins Cotton Contest

With a yield of 999 pounds of lint cotton per acre, Will McLeod, colored tenant farmer, won the Scotland County, N. C., five-acre cotton contest, according to a report reeeived by the U. S. Department of Agriculture from the North Carolina State Extension Service.

A check for $50 was presented to Mr. McLeod by the president of the local Chamber of Commerce. Farmer McLeod won the award with Coker 100 wilt-resistant cotton.

The county's three acre corn contest was won by J. C. Parker with a yield of 70.7 bushels per acre.

The Convenience Of The Public

The interest and convenience of the general public is the determining factor in formulating sales policies. That is particularly true in retail stores.

Evidence that the public appreciates such consideration was recently given in Victoria, British Columbia—a community which is accustomed to retail service similar to that prevailing in the United States, and which is served by several American chain systems. The last session of the Provincial Legislature adopted a law permitting any British Columbia municipality to enact ordinance forcibly closing all establishments of the same type each Wednesday.

The law was applied to retail stores, and an anti-closing committee succeeded in getting the question of a compulsory closing placed on the ballot in the last general election. The result was a decisive defeat for the measure, to the time of 4800 to 2700. The chairman of the committee which campaigned against the closing undoubtedly stated the majority view point when he said: "The people do not favor the creeping paralysis of business that is inherent in all-day closings."

This election is important, for the reason that the closing of retail stores on week days has been proposed for this country. In all probability, the voters of a typical American community would cast their ballots much as did the residents of British Columbia. The basic issue is whether or not maximum service to the public shall continue to be provided.

The consuming public simply wants stores to be open on week days, following normal and traditional business practices that work no real hardship on anyone.

What Is A "Surplus"

There are favored industries whose managers escape the trials and tribulations of the taxpayers. Such industries are accorded the privilege of tax-exemption and court as profits, income that would be taken as taxes from other productive enterprises and private citizens.

A good example is the tax-exempt Bonnerville power administration that claims an accumulated surplus of $16,327,000 from seven years of power sales which totaled $83,494,000. But it doesn't mention that it paid no taxes during seven years.

Had the project been taxed some twenty cents on the dollar of gross income, as were investor-owned plants of like character, this so-called surplus would have been inadequate to take care of taxes, let alone provide any profit.

Bonneville is a privileged, tax-exempt competitor of every business which must pay taxes before it can figure a surplus. It would have to be a pretty poor businessman who couldn't show a profit if he was allowed the same tax exemptions accorded publicly subsidized power plants. By its own figures, Bonneville is not showing the same effieiency as is required of business managed utilities which pioneered electric power development, while paying taxes to support government before earning a profit for investors.

The business-manager power industry's slogan is cheaper power through greater production: Bonneville's cry is cheaper power thru tax-exemption.

Hen House Etiquette

Athens, Ga., Jan. 20—(IP)—No gentleman ever walks into the hen house without knocking.

"It just isn't good manners," Arthur Gannon, Georgia extension poultryman, cautioned today. "And it isn't good business, either."

"Etiquette," he pointed out, "demands a knock on the door when entering any occupied room, and hens are sticklers for etiquette, being ladies."

An unannounced visit, Gannon said, flusters the hens, causing egg production to drop. On the other hand, a gentle rap on the door before entering prepares the hens for their visitor. The hens remain calm. Egg production remains up.

WOMAN'S PAGE

Now That We Can Have Plenty Of The "Staff Of Life", Try Using Some Of These Helpful Hints

Man , is a creature of short-lived memory. It doesn't take long to forget so-called "hardships" and to get used to conveniences and luxuries. We can walk into the grocery and buy a loaf of bread at any time; it hasn't been so long ago that bread was on the "hard to get" list, and we had to get to the store early to get the bread required for our families.

During the time that bread was not as plentiful as we Americans have been used to, we learned to save every scrap of bread and to utilize it in different ways. Now we have all we need, and perhaps there are bread scraps left over. Are we wasting these bread scraps and crumbs, or are we thinking up ways in which we can avail ourselves of a financial saving and a nutritional aid?

I find there are many ways to use bread crumbs and bread scraps. Bread crumbs for example—we can get much better results if we use different kinds of bread crumbs for different dishes. Soft crumbs make the most delicious stuffings. Crust crumbs—either finely ground or broken into fairly large pieces—go nicely into puddings and meat Patties. While dry, fine crumbs made from bread with the crust removed can be used to coat croquetts, tomato and eggplant slices, or veal for frying.

Let's look at these soft crumbs for a minute. They're the ones you get from inside the loaf of bread. You separate them from the crusts with a fork. Then it's best to make them with your hands. Pick the larger pieces of bread apart with your fingertips and keep at it until you have a pile of light, fluffy crumbs. This will take some time, of course, but you will find it time well used. The crumbs you get will blend very, very well with seasonings. Stuffings oftentime prove to be disappointing because they are unevenly flavored or downright tasteless.

You might like a recipe for making stuffings, and this one is a tried-out-and true recipe. For stuffing a five-pound roast chicken or duck, you will need about a quart of soft crumbs. To these crumbs, add a cup of one-half of seasoning vegetables — this is, chopped celery, parsley, and onions. Use one-half teaspoon of herbs, such as sage, poultry seasoning savory and so on. The amount of fat you use depends on the bird you're stuffing. A duck or goose generally contains more natural fat than chickens and turkeys. So, in stuffing a chicken and turkey, bear that in mind. However, the usual measure of fat is from one to one-and-one-half tablespoons for each cup of crumbs.

Soft crumbs are also good for topping meat or vegetable casseroles. They're used for thickening purposes in scalloped dishes and in stewed tomatoes. The latter is a very fine winter-time dish.

For extra flavor, I suggest that you toast crumbs first. An easy way to do that is to melt, for each cup of crumbs, a couple of tablespoons of table fat or good flavored meat fat in a shallow pan or frying pan. Use a low heat. When the fat is melted drop in the crumbs and stir with a fork. The crumbs will become well-toasted and delicately browned.

Fine dry crumbs make better coating for croquettes, tomato, and egg plant slices and veal than the larger crumbs. They are also used in crumb cakes, pastries and cookies. The first step in making them is to dry the bread thoroughly in a slow oven. When they're completely dry, roll them out on a bread board with a rolling pin or put them through a food chopper.

Now, a word about keeping bread crumbs. They must stay dry. If they get moist, there is danger of molding. If kept in an air-tight place, sooner or later they are likely to get rancid. So, the thing to do is to keep them in a dry, sterilized covered jar, away from moisture. For storing crumbs for a day or two only, a paper bag is quite satisfactory.

One of many recipes which utilizes left-over bread crumbs is baked hash. This calls for: One and one-half pints cold meat, chopped fine; one-half teaspoon onion juice; two tablespoons butter; one-half cup bread crumbs; one tablespoon chopped parsley; one teaspoon salt; one cup stock or milk; two eggs and one-eighth teaspoon pepper.

Combine seasoning with meat. Heat the butter without browning. Add crumbs, stir well, add milk, and cook until it thickens. Mix this with the meat. Then add the well beaten egg. Place in buttered baking dish and bake uncovered.

CRANBERRY-CITRUS SALAD

1 envelope unflavored gelatin
1-4 cup cold water
1 cup hot cranberry juice
1-4 cup sugar
1-2 cup orange juice and pulp
1-4 teaspoon salt
1 tablespoon lemon juice
1 cup grapefruit sections, cut in small pieces.

Soften gelatin in cold water. Add hot cranberry juice and stir until gelatin is dissolved. Add sugar, orange juice and pulp, salt and lemon juice. Cool and when mixture begins to stiffen, fold in grapefruit. Pour into individual molds that have been rinsed out in cold water and chill. When firm, unmold onto lettuce and serve with mayonnaise dressing. Serves 6.

BELL SALAD

12 canned pear halves
Red or green food coloring
3-4 cup currant jelly
2 3-ounce packages cream cheese
1 1-2 tablespoons cream
Salad greens

Drain pear halves. Place 1-4 teaspoon red or green food coloring in 1 cup water. Dip pears in this coloring solution until tinted very lightly. Slice a thin section from the bottom of each pear half so that it will stand sturdily. Put the two pear halves together with a spoonful of currant jelly between them and stand upright . Mix cream cheese and cream and beat with a spoon until well blended. Put mixture in pastry tube and make a decorative line over the space where the two pear halves meet. Top with a small dab of jelly. Makes 6 salads.

CURRANT TURNS

2 cups sifted flour
2 teaspoons baking powder
1 teaspoon salt
4 tablespoons lard
Milk
3 tablespoons butter or margarine
1-2 cup brown sugar
1 teaspoon cinnamon
1-2 cup currants
1-2 cup chopped nuts

Sift flour, baking powder and salt together. Cut in lard with two knives or pastry blender, until mixture has a fine even crumb. Add enough milk to make a soft dough Turn onto flour pastry cloth or board. Knead dough until smooth. Roll as nearly round as possible. 1-2 inch thick. Spread with softened butter or margarine and sprinkle with sugar and cinnamon, currants and nuts. Cut circle into eight wedge-shaped pieces. Roll each piece, starting at the wide end Place on greased cookie sheet and bake in hot oven (425 degrees) for 20 minutes.

The most widely used species of food fish is the herring.

ORANGE AND JELLY GARNISH FOR FOWL

A festive garnish for the holiday turkey, duck or goose can be made by fashioning small rounds of currant jelly with a melon ball cutter and using these in the center of broiled orange slices all around the platter.

To make this colorful and tasty decoration, first peel several oranges and slice them crosswise in 1-inch thicknesses. Sprinkle the slices with a little brown sugar and place under a medium hot broiler until they are thoroughly heated and start to brown on top. Make a wreath of endive on the platter around the turkey and lay the broiled orange slices on this.

Then, with a melon, ball cutter, dip into a glass of currant jelly. Twist the cutter to make circular balls of the jelly and place one of these in the center of each fruit slice.

Oatmeal Cookies:— 1-2 cup fat 1 1-2 cups ground oatmeal or rolled oats, 1-2 cup chopped peanuts, 1-4 cup milk, 1 egg beaten, 1-2 teaspoon salt, 1 cup seedless rasins, 1 cup sirup. 1 1-2 cup sifted flour. and 2 teaspoons baking powder.

Cream the fat and add the sirup mixed with the beaten egg. Sift together the dry ingredients, except the ground oatmeal, and add with milk to the first mixture. Add the ground oatmeal, nuts and raisins. Mix well. Drop by spoonfuls into a greased baking sheet. Bake to a golden brown in a moderately hot oven (375-400 degrees F.). Remove from the sheet about 60 cookies. Two teaspoons of cinnamon may be added to the recipe if desired. if sorgham sirup is used, omit the baking powder and add 1-2 teaspoon soda to the dry ingredients.

Here are two clever suggestions for Christmas pie, cut out holly leaves (with sharp knife) and holly berries (with thimble). Sprinkle leaves with green sugar and berries with red. Arrange in wreath of sprays on top of pie and bake. Colored sugar can be made by adding a drop of cake coloring to sugar on a plate and working it with a fork.

The second suggestion is a sauce for cakes and puddings: 1 cup molasses, 3 tablespoons butter, and juice 2 lemons. Cook molasses and butter for five minutes. Remove from fire, add lemon juice, and stir slightly.

PLUM PUDDING WITH BUTTER SAUCE

1 cup ground suet
1-2 cup molasses
1-2 cup corn syrup
1 cup seedless or seeded raisins
1 cup currants
1 cup chopped citron
3 cups sifted all-purpose flour
2 teaspoons baking powder
1-2 teaspoon salt
1 teaspoon cloves
1 teaspoon cinnamon
1 1-2 cups milk

Combine suet, molasses, corn syrup, raisins, currants, and citron. Sift together dry ingredients. Add to suet mixture alternately with milk. stirring vigorously after each addition. Turn into a greased 2 quart mold. Cover tightly and steam for 5 hours. Serve with Butter sauce Serves 10-12.

Butter Sauce

1-2 cup butter
3-4 cup sugar
1 tablespoon cider vinegar
1 egg
1-2 cup water
1 teaspoon vanilla

Cream butter. Add sugar gradually and cream thoroughly. Add remaining ingredients and beat thoroughly. Cook over hot water, 10 to 12 minutes, stirring constantly, until thickened. Serve hot or cold over Plum Pudding. Yield 1 cup.

To save all possible thiamine in oatmeal, the shorter the cooking the better.

TUNA PICKLE RABBIT

1 cup milk
1 tablespoon butter or margarine
2 tablespoons flour
1-4 teaspoon salt
1-8 teaspoon each pepper and dry mustard
1-2 teaspoon Worcestershire sauce
1 cup (1-4 lb.) grated sharp American cheese.
3-4 cup coarsely flaked tuna
1-3 cup thinly sliced sweet pickles
Toasted crackers

Make a thin white sauce by melting butter into top double boiler. Remove from fire, stir in flour gradually to make a smooth paste. Gradually stir in milk, blending it with flour and butter paste until smooth. Cook, stirring constantly, in top of double boiler until thickened. Add salt. pepper, mustard, Worcestershire sauce, cheese and tuna. Heat 5-10 minutes until cheese is melted and mixture is hot. Add sliced pickles just before serving. Serve over crackers —preheated in the oven. Garnish with a filip of paprika.

MOCK SCRAPPLE

1-2 pound bulk pork sausage
2 1-2 cups milk or water
1 cup uncooked whole wheat cereal
1-2 teaspoon salt
1-8 teaspoon pepper.

Cook sausage until browned, stirring with a fork. Drain off any excess fat. Add milk and heat to boiling. Stir in 2-3 cup of the cereal so slowly that boiling doesn't stop. Add salt and pepper. Cook 5 minutes longer, stirring frequently. Pour at once into a medium-sized loaf pan which has been rinsed with cold water. Chill until firm. Unmold and cut into 1-2 inch slices. Roll in remaining 1-3 cup of cereal. Cook slowly on hot, greased griddle or in skillet, turning to brown both sides. Serve hot with syrup or honey, if desired. Makes 6 servings.

YAMS WITH ALMONDS

4 to 6 large yams
4 tablespoons butter or margerine
1-4 cup blanched almonds, sliced
1-4 cup old fashioned molasses
1-8 teaspoon powdered mace
1-2 teaspoon sugar
1-3 teaspoon cinnamon

Scrub potatoes, boil in their jackets till tender. Skin. Cut into quarters or halves. Place in greased baking pan. Toast the sliced almonds in the butter or margarine. Remove from heat. Add molasses and powdered mace. Pour over potatoes. Mix sugar with cinnamon and sprinkle over top. Reheat gently just before serving.

UNBAKED FRUIT CAKE

3 lbs. seeded raisins, 1-4 lb. candied orange peel, 1 teaspoon nutmeg, 2 lbs. dates, 2 lbs. pecans, 1 orange juice and rind, 1-2 lb. candied cherries, 2 lbs. figs, 1 teaspoon salt, 1-2 lb. candied pineapple, 2 teaspoons cinnamon, 1-4 lb. citron, 1-2 cup grape juice, 1 cup sugar, 1-4 lb. candied lemon, 1-2 teaspoon cloves.

Chop fruit, nuts, and add spices. Mix with juice. Line crock with brown paper and insert two pieces of cloth to facilitate removing. Pack ingredients in very closely. Let stand in cool place 10 days and nights.

FRUIT PIE TOPPING

Crumble toppings for fruit pies were popular during the food crisis to conserve both flour and shortening. To make a simple crumble topping, mix together 3 tablespoons each of sugar and flour and 1-8 teaspoon of salt. Cut or rub in 2 tablespoons margarine or butter until the mixture is crumbly, and sprinkle topping over the fruit filling before baking. For an apple pie, or an apple-pear combination, add a bit of grated lemon rind or cinnamon to this crumble topping.

TURKEY AU GRATIN

2 tablespoons melted fat
1-4 cup flour
1 cup turkey broth or water
1 cup evaporated milk
1 teaspoon salt
Few grains pepper
2 cups diced cooked turkey
1-2 cup grated American cheese
1-2 cup bread crumbs.

Blend flour with melted fat, add turkey broth and cook over low heat until thickened, stirring constantly to keep smooth. Add milk and cook until thickened. Stir in salt, pepper, and diced turkey and pour into a buttered baking dish. Mix bread crumbs with cheese and sprinkle over the top of the casserole. Brown in a hot oven (400 degrees). Yield: 6 servings.

BUTTERSCOTCH APPLES WITH ICE CREAM

Choose 6 uniform cooking apples, wash and core. Peel the apples one-third of the way down from the top. Place the apples in a baking dish and prepare a syrup of one cup of brown sugar and a cup of water. (Corn syrup or honey can be used as part or all of the sugar, if preferred; however, decrease the amount of water slightly if either is used). Add 2 tablespoons of butter and pour over apples. Bake in a moderate oven (350 degrees) for 45 to 60 minutes, or until tender, basting with syrup occasionally.

Serve the apples slightly warm or just cool, filling the centers and topping them with vanilla ice cream. One quart of ice cream will serve six. Any extra sauce left on the apples may be served over the top.

HARLEQUIN DESSERT

Spread a thin layer of vanilla ice cream on bottom of refrigerator tray. Top with layer of raspberry jam. Continue with another layer of vanilla ice cream and top that with a layer of peach jam. Finish with layer of ice cream and smooth over top. Sprinkle with shredded cocoanut and almonds and allow to harden. Cut in finger-width slices.

You can build resistance to colds by restful sleep.

Helpful Household Hints

STORAGE HINT

To be kind to your food budget, protect your leftovers by storing them wisely. Cover meats and leftover custards made with milk and eggs. Place them in the coldest part of the refrigerator since they require a lower temperature than leftover fruits and vegetables.

Waxing sliding drawers in kitchen or bedroom will help prevent their sticking.

TOUCH UP SCARS

To touch up the white gouges in chair and table legs, get out your bottle of iodine and apply with small water color paint brush.

Harness-like clothes will wear better and last longer if hung up after use.

Fold bias cut dresses flat when storing away so their own weight won't stretch them.

Perspiration and constant wear are hard on shoes. If shoes are permitted to rest and dry between wearing, they will regain their original shape and give longer service.

In a hot, dry room a pan of water on the floor behind the piano helps to keep the sounding board from drying and cracking.

Speed Fiend: "It's great speeding along again like this. Don't you feel glad you're alive?

Passenger: "Glad isn't the word; I'm amazed!"

THE MODERN FARMER

THE BYRD NEST

By Rev. Bernard O. Byrd
—Guest Columnist.

TO THEM LIKEWISE

One of the best steps a man can take on the road to social fairness, is seen in the advice given by the Lord Jesus Christ when he said, "Whatsoever ye would that men should do to you, do ye also to them likewise." Should you question why such advice should be heeded, I can think of no better answer to give than a statement made by a spirit filled preacher of the gospel, who said, "Whatsoever a man soweth, that shall he also reap."

The best way to get a thing is to give it away. It is possible that some of my readers will refer to the foregoing statement as paradoxical, but I am happy to assure you that it will work. Humanity is a mirror, before which we may perform, and from which we receive our performances in return. Humanity reflects your smiles, your kindness, your fairness, and your gifts. The only thing humanity can do to your actions, is to increase them. Humanity cannot change your smiles into frowns, but it can make them a cluster of smiles. Humanity cannot substitute meanness for kindness, nevertheless, your kindness can be caused to grow a large family.

Whenever a man is filling an order of social dealings for somebody else, he should remember that he actually is filling an order for himself. A lady said to her cousin, on an occasion when the two were examining some beautiful lamps, "Cousin: you should have one of these lovely table lamps in your living-room. Why don't you buy one?" "I shall buy one," said the cousin. "Pick out the lamp you think I should put in my living-room." The lady began looking about for a beautiful lamp. Finally she picked out one and said, "Get this one." When the lamp was paid for, the cousin advised the salesman to deliver the lamp to the home of the lady who had chosen it. "But Cousin . . ." "Oh, that's all right," answered the cousin, "I had been wondering what you liked. You have helped me to select your Christmas present." What the lady chose for somebody else was delivered to her own house. That experience is a perfect parallel to a man's dealings with humanity. You may order some words for somebody else, but they will be carefully wrapped and delivered to your own address. Your actions may be hurled in the other direction, but like the bamboo stick, they will return.

If a man desires success in any branch of life, he should seek for himself, a guide. The mountain climber, the forest rover, the sea navigator, and the air explorer all use guides. Teachers, and books are not producers of intelligence; they guide men in their efforts to obtain it. Doctors are guides to health. Lawyers are guides to the enjoyment of one's rights. Preachers are guides to good morals and salvation. In everything, I repeat, a man needs a guide. If you would travel thru the forest of humanity and make a safe happy ending, guide yourself by doing to others what you would that they should do to you. After all there is but one course to pursue: 'Determine the things you like and do those things to other people.

Negro Chemist Had Part In USDA Penicillin Research

U. S. May Import 1,000 Tons of Palm Kernels From Liberia

Washington, D. C.—The U. S. Department of Agriculture has indicated that the American tinplate industry may import from the Republic of Liberia this year, 1,000 tons of palm kernels, the oil from which is valuable in tinplate manufacture.

This estimate was given last week following the Department's announcement that import licenses, required under War Food Order 63, will be granted—within limits of the International Emergency Food Council allocations to importers of palm kernels from Liberia and palm oil from Portugese colonies.

During the five years before the U. S. entry into World War II, Liberia exported a total of more than 40,000 metric tons of palm kernels and about 4,000 tons of palm oil. Neither the total exports nor the price of Liberian palm kernels for the current year has been definitely set, but Department officials expect U. S. imports to total 1,000 tons, at an average price of about $100 per ton.

Last year the U. S. bought 500 tons of palm kernels from Liberia for export through the United Nations Relief and Rehabilitation Administration (UNRRA) to Czechoslovakia to help relieve the critical vegetable oil shortage in that country.

Helping the Liberians to improve the preparation of their palm kernels for export is an important part of the work being done by Frank E. Pinder, agricultural production specialist of the U. S. Department of State's Economic Mission to Liberia. Mr. Pinder, who was for eight years a colored county agent in Florida and for 3 years an agricultural economist of the U. S. Department of Agriculture, advises the Liberians on methods of preparing palms kernels and other agricultural products for market.

Department officials say that oil from Liberian palm kernels is in great demand by manufacturers of tinplate.. They point out that there is no substitute for palm oil in commercial practice in the tinplate industry. Portugese palm oil which is high in caretene, is urgently needed by manufacturers of certain vitamin preparations used in combating night blindness among airplane pilots.

In addition to the palm oil kernels which the U. S. may get from Liberia and the Portugese colonies the Department is negotiating with Belgium for palm oil from her colonies to further meet America's

Penicillin Researcher

Miss Sinah E. Kelley, analytical chemist of the Northern Regional Research Laboratory of the U. S. Department of Agriculture, had a hand in the development of techniques for the mass production of Penicillin—the miracle drug which has saved thousands of lives. She is a graduate of Radcliffe College and has done advanced work at New York University. The laboratory is situated in Peoria, Illinois.

Miss Sinah E. Kelley Is Assisting In Important Mass Production Of Famous Drug

Washington, D. C.—In the development of methods for mass production of penicillin, the miracle drug which is saving thousands of lives—Miss Sinah E. Kelley, a colored analytical chemist of the Northern Regional Research Laboratory of the U. S. Department of Agriculture, assisted with the project in the latter stages by performing important analyses, says Dr. L. B. Howard, chief of the Bureau of Agriculture and Industrial Chemistry.

Miss Kelley, who has done advanced work in chemistry at New York University, is a graduate of Radcliffe College. She transferred from the Picatinny Arsenal three years ago to the USDA laboratory at Peoria, Ill., where she is engaged in analytical chemical work in the Fermentation Division.

The major part of Miss Kelley's work consists of performing analyses for sugar and for the various fermentation products. During the war her work was connected with the mass production of penicillin. The production of penicillin is linked up with agriculture in that it is produced by a mold that lives on a diet composed almost completely of agricultural products—corn steep liquor and milk sugar.

Penicillin was discovered by a British scientist nearly 20 years ago. But up until a few months before our entrance into World War II, British scientists had not been able to produce the drug in significant quantities. During the summer of 1941 they brought their penicillin problem to the Northern Regional Research Laboratory where American scientists developed mass production techniques which made it possible to produce

J. H. Maclin Community Leader Produced Fine Tobaco Crop Last Year

Brunswick County, Va.—J. H. Maclin, a community leader and a tobacco farmer in Brunswick County, made an unusually good yield on fine-cured tobacco in 1946. Mr Maclin planted one and three tenths acres of Yellow Mammoth tobacco and got 2482 pounds which sold for $1035.87. Eighteen hundred pounds of the total yield were sold during a period of low market prices.

In producing such a yield, Mr.

Negro Farmer Doubles His Yield By Conserving His Soil

Cade Nappier, a colored farmer of Nelson County, Va., who started renting a gullied farm that was practically washed away 10 years ago, has doubled his tobacco yield by following sound soil and water conservation practices, reports the Soil Conservation Service of the U. S. Department of Agriculture.

Shortly after Farmer Nappier began buying the farm, five years ago, he called on his Soil Conservation District to make a conservation plan for the farm. Among other things, the plan called for building

Farms Are Getting Larger And Fewer With Mechanized Production

Washington, D. C.—The shift to mechanized farm production has been accompanied by a trend toward larger and fewer farms, reports the Bureau of Agricultural Economics of the U. S. Department of Agriculture.

BAE points out that according to preliminary 1945 census data, over half the farm land in the country now is in farms of over 500 acres. 25 years ago such farms comprised only a third of the farm land. Farms of over 1,000 acres today account for 460 million acres of the nation's farm land, or 40 per cent of it, compared with less than 25 per cent in 1920. In the South 15 per cent of the farm land is now in farms larger than 1,000 acres..

Despite a 186 million-acre increase in farm land, there are now 600,000 fewer farm operators in the Nation than in 1920, says BAE.

Census data shows that during this 25 year period, the number of colored farmers in the South—where about 98 per cent of all colored farmers live—decreased from 915,000 to 673,000. For the same period, the up-down population pattern of white farm operators in the South showed a net decline of only 56,000.

Since 1940 there has been a reduction of 7,000 colored farm operators and 99,000 white operators in the South, according to preliminary census figures. (In 1920 there were 2,284,240 white operators in the South; in 1940 there were 2,326,904, and in 1945, about 2,228,000.)

The trend toward larger farms and fewer farm operators also has been accompanied by an increase in ownership, especially in the Southern region. During the last five years, according to the Census,

Rural Home Improvement Featured in Broadcast

Washington. D. C.—A sample of the slow but steady home improvements which colored farmers are making all over the rural South was featured recently in a broadcast over WAPI, a Birmingham, Ala., station.

Mrs. Pearlie O'Neal, a farm woman of Randolph County, Ala., and Mrs. E. A. Shorter, the county home agent, who were interviewed by the station announcer, Jimmie Wilson, described the home improvement program which is underway in their county. Mrs. Shorter pointed out how she and the farm women of her county have made a systematic study of the home needs and then devevlop plans for meeting these needs.

Mrs. O'Neal, who has already made some improvements in her eight-room farm home, told of the improvements she had made and what they meant in terms of easing the work load at the same time increasing the home comforts She pointed out that through Rural Electrification power, she now has electric lights, an electric pump, a refrigerator, a washing machine, an electric churn a toaster and two electric irons.

"Now for the first time" said Mrs. O'Neal, "I don't feel over worked, tired and run down at the end of each day. And not only is my work made lighter, but my family is enjoying greater comfort."

Mrs. Shorter said that most of the rural people in her county are seeking to improve their homes. But some just don't have the money she pointed out, and others live in sections that presently are not reached by electric power.

Sweetpotato Improvement Program on in Maryland

White and colored growers on the Eastern Shore of Maryland and Specialists from the University of Maryland met at Salisbury, Md., recently and mapped a six point program for the improvement of the Maryland Golden sweetpotato reports Martin G. Bailey, colored district agent of Maryland. And they also considered the adoption of an advertising campaign to promote the sale and consumption of this product, he says.

Specialists from the college pointed out at the meeting that the improvement program has become necessary because seed stocks of the Maryland Golden variety have been gradually reverting to the original parent. Hhis has resulted in a loss of some of the qualities which have enabled it to eommand a 25 cent a bushel premium, over varieties formerly grown, ever since it was released for production in 1930 by the Maryland Experiment Station.

The six-point program, adopted by growers at the meeting, calls for saving best potatoes for bedding, cleaning old beds and putting in new soil, sorting seed just- before bedding, cutting seed, and throwing away poorly colored potatoes dipping seed in wettable sperson, and growing next year's seed in special field on which sweetpotatoes have not been grown for five years previously.

Maryland's climate and soil are especially good for sweetpotato production, the specialists pointed out. The size of the crop has been gradually increasing during the past 10 years to a total of 1,700,000 bushels in 1946. The yield per acre of 175 bushels far exceeds that achieved in other states.

New PMA Administrator Named

Secretary of Agriculture Anderson has announced the appointment of Jesse B. Gilmer as Administrator of the Production and Marketing Administration and President of the Commodity Credit Corporation. He has served as Acting PMA Administrator and Acting President of CCC since last Novvember.

Announce Loan Program for Blue Lupine Seed

White and colored farmers of the South will receive a loan of four cents per pound on top grade blue lupine seed produced this year, the U. S. Department of Agriculture announced last week.

The seeding of blue lupine as a winter cover crop has increased greatly in recent years in the Southern states. Increasing quantities of seed have been reequired for this purpose. The production of seed increased from approximately 5,000,000 pounds in 1943 to more than 37,000,000 pounds in 1946 and further increases are expected.

The principal producing States are Alabama, Florida, and Georgia. The use of blue lupine as a winter legume cover crop is expanding rapidly into the sea coast areas of South Carolina and the Gulf Coast areas of Mississippi and Texas.

South Africa Has Farm Fish Ponds

The modern practice of digging and fertilizing farm ponds for fish production, which has been widely adopted in this country, is now being encouraged in South Africa, Soil Conservation Service of the U. S. Department of Agriculture reports.

A recent issue of "Soil Conservation Service," a USDA publication, points out that South African fisheries experts have launched a fish raising program similar in method to that recommended by SCS, including the fertilizing of pond water.

Penicillin Saves Turkeys

U. S. Department of Agriculture experiments indicate that penicillin is highly effective in saving turkeys that thave become infected with the swine-crysipelas organism, to which turkeys as well as swine are susceptible. The infection in turkeys usually attacks the flock just before marketing, when the birds are most valuable.

Dr. C. G. Gray of the Bureau of Animal Industry found that penicillin reduced the mortality of infected birds to 10 per cent in an experiment in which 100 percent of untreated birds, similarly affected by the disease, died. The drug suspended in peanut oil, was given in daily doses of 20,000 units each for four days.

No Breathing Spell for Oil

When the war ended, the oil industry anticipated a breathing spell—a period of substantially lessened demand for its products. But, as an article by J. H. Carmical in the New York Times, points out, the direct opposite oceurred.

Demand, in other words, eontinued to go up. As a result, 1946 was one o fthe best years in the industry's history from the point of view of output. Domestic crude production was the highest in many years.

The figures tell the story. Last year, the first full year of peacetime production, the industry processed a record volume of 1,727,000,000 barrels of crude. From this, it obtained 746,000,000 barrels of gasoline, 287,500,000 barrels of light fuel oil, and 428,000,000 barrels of heavy fuel oil—to say nothing of hundreds of other items.

One very important development has been the industry's success in utilizing foreign sourees of supply. Imports of crude oil and oil products have averaged around 375,000 barrels daily. Most of this came from Latin America—but cargos of oil from the great new fields in the Persian Gulf are appearing.

These facts are a guide to oil's increasingly important role in American life. The demands made by motor vehicles seem to be ever-expanding. The trend toward dieselization of the railroads is strong. Oil finds increasing favor as a home heating fuel. And the industry, which made so plendid a record in time of war, is quietly filling our voracious needs in time of peace.

Plan Now

To join and support your County Farm Bureau.

To check stored farm machinery. Be sure it is not exposed to a leaky roof.

To prune fruit trees and grape vines within the next two months.

To pasture small grain crops only on days when the ground is dry enough to prevent the livestock from breaking through.

To purchase only high grade baby chicks. Inferior chicks are expensive at any price.

To be on the lookout for fertilizers that will be needed in the early spring. Nitrogen for small grains will likely be needed first by most.

To save 100 per cent of the pigs farrowed on your farm this season. That might be accomplished thru the use of a farrowing pen with a sloping floor.

To have more fruit of a desirable quality by spraying to control both insects and diseases. Spray, schedules may be obtained from your county agent or vocational agriculture instructor.

To plant only tobacco seed that is known to be root rot resistant.

To join with others this week in the reeognition of 4-H Club members in your community.

To tile your farm plan for 1947 with your local AAA office.

To join your county Farm Bureau.

To eontinue to feed dairy cows on good grade of legume hay until spring pastures are well under way.

To repair brooder house and equipment and to have everything in readiness before purchasing baby chicks.

To prune grape vines within the next few weeks.

To support the 4-H Club program in your community by encouraging boys and girls to enroll.

To repair broken terraces before additional rains make the breaks more severe.

To sow a greater portion of the barnyard manure on your farm through the use of straw and low grade hay as bedding.

To prepare, at the first opportunity, part of the garden for early planting.

To creep feed lambs. Records show that grain fed to sheep yields a greater net return than when fed to any other type of livestock.

To pick up all loose rock in pastures and meadows before the vege tation grows up and hides them.

To improve the dairy cows in your herd by becoming a member of the Artificial Breeding Association in your county.

jeIo-mdrIv

Animals Are Chief Means of Spreading Foot-and-Mouth Disease

The outbreak of foot-and-mouth disease in Mexico, with its resulting threat to the United States, has caused the U. S. Department of Agrieulture officials to repeat the warning that this livestock plague is highly infeetious and spread chiefly by animals. The next most common carrier of infection is persons who visit infected premises. A third source of danger comprises infected vehicles and products of various kinds, including garbage that eontains fresh meat.

Honor Awards Established

Plans for honoring employes who have given exceptional or long service to the welfare of American agriculture were announced last week of Secretary of Agriculture Clinton P. Anderson. The first awards will be made about July 15.

Highest of the three types of awards is the Distinguished Service Award for "notably outstanding eontributions to agriculture and to the publie service." The Superior Service Award will be given for "service of unusual value beyond that ordinarily required." Individuals will receive appropriate citations and symbolic medals or emblems. Length-of-service awards also will be given for each 10 years of service in the Department.

Dairy Hints Given in New Pamphlet

Better producing herds for tomorrow on Tennessee farms can be achieved by breeding all milk cows to good dairy bulls and then saving and raising the heifers as herd replacemnts, is the theme of the new pamphlet just published by the agricultural extension service of the University of Tennessee and the U. S. Department of Agriculture.

Written by Lynn Copeland, district dairy specialist, the publication, leaflet number 87, points out that the producing ability of milk cows must be improved, first by breeding more production into the cows, through the use of good bulls and then through good feeding to enable the cows to produce up to their inherited ability.

Of interest to dairymen throughout the nation, the publication begins with the discussion of the raising of veal calves. "The average calf from a grade Jersey cow sired by a beef bull will weigh about 55 to 65 pounds at birth. Research has shown that it takes 10 to 12 pounds of milk to produce one pound of gain," the leaflet reads.

In order to graw such a calf to a good veal weight of 175 to 200 pounds, it would require from 1,100 to 1,400 pounds of milk. "It is easy to figure how much that amount of milk is worth on today's market, and to compare the results with what a 175 to 200 pound calf will bring when sold as veal. The answer is plain. Marketing a cow's milk through the means of a veal calf actually brings less net return than almost any other method of selling her product," it is pointed out.

In the next section the raising of calves "off" the cow is thoroughly discussed. That alone is a sub division of the leaflet that should be read by every dairyman in the nation.

Other sections are devoted to: (1) the results of using beef bulls on dairy cows, (2) building better herds, and (3) "Do You Know?"

A free copy of the publication can be obtained by addressing an envelope to the Agricultural Extension Service, University of Tennessee, requesting the Leaflet Number 87.

Turkey Price Support Program

The U. S. Department of Agriculture has announced a nationwide price support program for turkeys. The program will be operated from the present date through June 30, 1947. The program may involve the purchase by Government of up to 10 million pounds of turkeys including 1946 crop birds remaining unsold by producers and breeding stock which will be marketed late this spring.

Purpose of the program is to enable producers who own 1946 turkeys to sell them—largely heavy tom turkeys—at prices which will reflect not less than 90 percent of parity. This eannot be done thru regular trade ehannels under present market conditions, principally because record stocks of turkeys were in public storage on Jan. 1.

Under the price support program the USDA will, at the outset, purchase turkeys owned by produeers in storage or live and on farms at levels intended to reflect a national average producer live weight price of 25 cents per pound for all young toms and for heavy young hens, and 32.5 cents for hens under 18 pounds. A national average live weight price of 27.9 cents per pound at the farm is required to reflect 90 percent of parity to the producer.

Nutmeg From Grenada

A substantial portion of the world's supply of nutmeg are produced on the tiny island of Grenada, one of the British West Indies located approximately 100 miles north of Venezuela, says an article in the March issue of Agriculture in the Americas, a USDA publication. Nutmeg trees require more or less constant rainfall thruout the year and grow best at altitudes between 500 and 1,500 feet above sea level. The trees begin to bear at 6 or 7 years of age and continue bearing for 100 years or more.

Mule Breeding Outlook in South Bright

An optimistic outlook for southern mule breeders, expressed by Dr. J. C. Miller of the Univrsity of Tennessee, keynoted the meeting of the Tennessee Jack, Jennet and Mule Breeders' Association which met last week at the Middle Tennessee Experiment Station.

In the opening address, "Outlook for Breeding of Workstock as Applied to the South," Dr. Miller showed by census figures the decline in mule population in the Midwestern mule producing states to be 64 per cent in the past 15 years as compared with a very small decline of mule population in the southern cotton growing states.

He showed that the price of mules in the midwestern states had greatly dropped; whereas, in the South there was a slight increase in price. He pointed out in the southern states there is approximately one young mule under 27 months of age for every 84 mules. From these figures Dr. Miller drew the following conclusions:

In spite of increased mechanizations, the small cotton farmers of the South will need mules; the midwestern states are definitely going out of the mule producing business.

In the past Tennessee has been a trading center, importing and exporting more mules than any other state, but if the midwestern states cease to produce mules for the South the market will be open for Tennessee mule producers provided they can have the stock ready.

Dr. Dennis Sikes, associate veterinarian of the University of Tennessee, discussed the prevalence providtoms and control of bots in work stock, as well as the control of other parasites.

The shortage of premium money offered for the showing of jack stock at the Tennessee State Fair prompted much discussion during the afternoon session.

Among visitors attending the anual event were Commissioner of Agriculture, O. E. Van Cleave, and Dr. C. E. Kord, state veterinarian, who announced that jacks would no longer be included in the stallion enrollment law.

B. C. Evans, Shelbyville, was elected president of the association for the coming year. C. A. Zimmerman, Winchester and John Ewing, superintendent of the Middle Tennessee Experiment Station, Columbia were elected Vice President and secretary respectively.

A tour of the jack and jennet-breeding farm followed the close of the business session. Much interest was shown in the dynamometer demonstration. The dynamometer is an instrument which tests the pulling power and stamina of mules.

The Vital Force

To an Ameriean, steeped in ideals of liberty, the most appalling trend in the world today is the growth of collectivism. Practically all of the nations of the Old World have turned their backs on freedom, and aecepted, willingly or otherwise, the cruel ideology of the super state. Under collectivism, the individual is nothing, except insofar as he can be used to serve the purposes of the govtrnment. The state all

This leavees the Unitd States almost alone as the citadel of a tradition of freedom which goes back to the Magna Carta. And this imposes on the government and the people of the United States an enormous obligation to prove that the dignity of the individual still lives, that the rights of man are a faet and not a myth that freedom is a vital force that will not be denied.

This obligation can be discharged in only one way by resisting every encroachment by the state upon the privileges, the rights and the prerogatives of individuals. If we permit government to dominate us in our economic life, we will eventually have government domination of all other facets of existence. Freedom is an absolute once we temporize with it, we pave the way for its destruction.

Those nations which wish collectivism are entitled to it. But it must never be confused with freedom or allowed a foothold here.

Dairy Animal Goal Set by Breeding Group

By Robert Battle

The breeding artificially of 10-000 head of dairy animals in Middle Tennessee is the goal of the State Artificial Breeding Associations for the seasons ahead, officials of the assocation said today.

The report of the herds where registered dams have been bred through the improved method of breeding artificially reveals that since the organization of the Tennessee Association, some 4,000 heifers and producers have calved as a result of the process.

It is felt that the service of an outstanding bull can be widely extended and made available to small dairy farmers through such an organization.

Dairymen of the Mid-State area have found that "a cow is only as good as its dam and sire," and have set up seven breeding associations which include Davidson, Williamson, Giles, Maury, Smith, Rutherford and Sumner Counties in an effort to improve the area herds as to grade of animals and amount of milk produced annually.

The newest of the county organizations to be organized is the one in Sumner County where 150 dairymen owning 1,200 head of cattle have become members in an effort to "do away with the old time hero bull" and improve the stock of the herd.

One of the main advantages of the artificial breeding of dairy animals is that the cows can be bred in the right seasons of the year to keep milk production as near equal as possible throughout the 12 months, officials of Middle Tennessee associations agree.

It is pointed out by authorities that when the bull runs with the heifers and cows in the barn that the young will calf too early and the others will all come fresh during the summer months. This would mean practically no milk on the market during the winter months when the prices seem to be higher, or at least the demand greater for the product, a member of the Davidson County organization declared.

There is said to be considerable interest in other counties of Middle Tennessee. A committee had been set up in Marshall County—one of the leading dairy centers of the state—in an effort to establish an organization there by September.

Each member of the various association pays a flat fee for his membership and then a small service charge. It is anticipated that within another year the Central Association will be supplying 12 or more counties in the area.

The Tennessee Artificial Breeding Association, Incorporated, started operation officially on May 6, 1946. Thirty acres of land with a bull barn, laboratory, and a small residence, all owned by the state was made available to the organization.

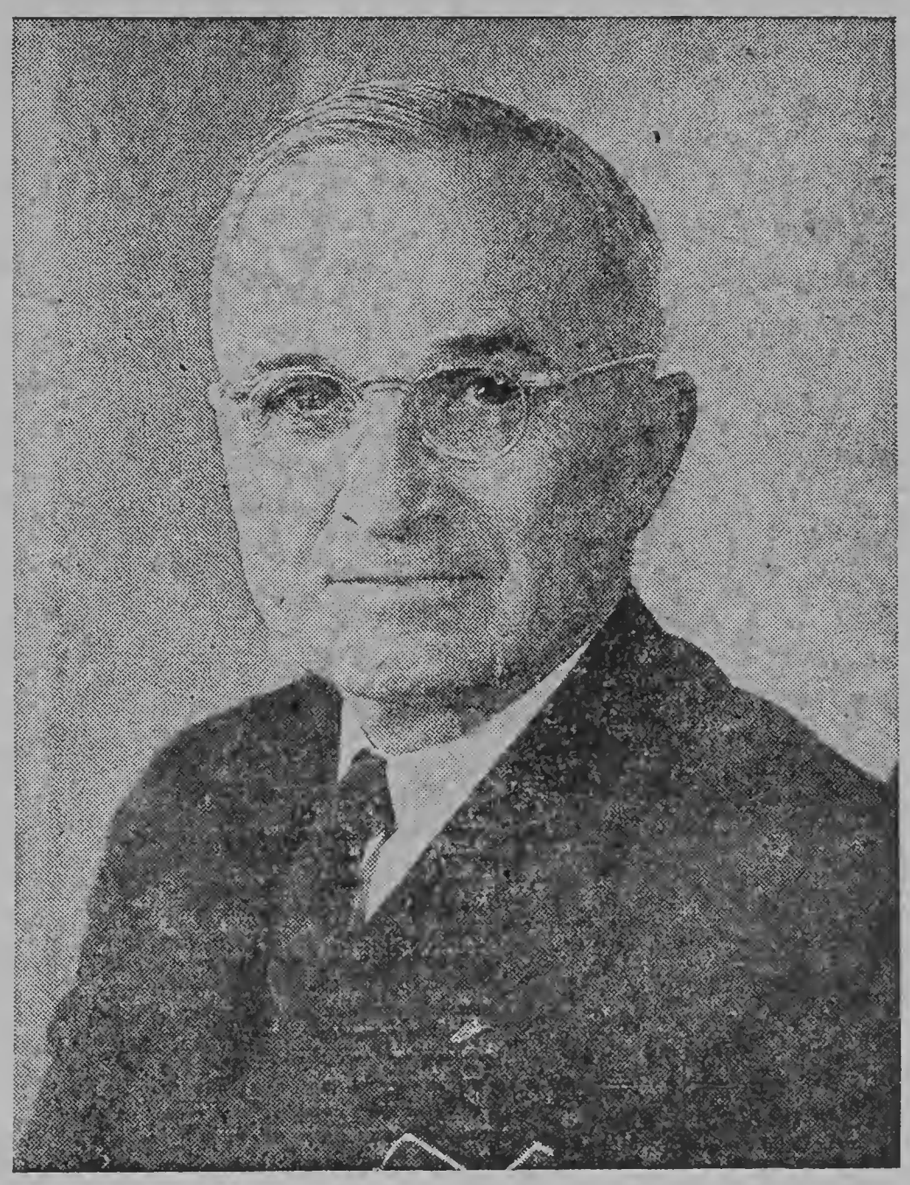
The purpose of the Central Organization, it is pointed out, is to maintain a battery of outstanding dairy bulls to be used by the local artificial breeding associations in the various counties.

Grade Improvement

Of the cattle bred through means of artificial insemination some 80 per cent are said to be grade cattle. While the use of the organization insures the best in breeding for the registered cattle, it means much more to the grade cow owner. His animals can give birth to a calf, which when freshened will be a better producer than the dam because of the high rating of milk production of the dam and granddam of the bull.

Officials point out that dairymen hope that in the future the herd bull can be done away with—especially in small herds—and that Tennessee dairy farms will be improved to the extent that they can supply enough milk to prevent retail and wholesale dairies from purchasing powdered and skim milk from other states to sell on the local markets.

What has happened to all those old fashioned fountain-pens that could write everywhere except under water?



Rocky Mount, Va., Feb., 1947—President Truman, in discussing the contribution that Booker T. Washington made to our national welfare with a committee from the Booker T. Washington Birthplace Memorial said:

"Booker T. Washington was a great American. He worked unselfishly and untirmgly for the welfare of his fellowman."

It was out of appreciation for this great contribution that the United States Government paid tribute to Booker T. Washington by coining a memorial half dollar in his honor. Proceeds from the sale of this coin will be used to help establish at his birthplace in Franklin County, Virginia, a "service memorial" to perpetuate his ideals and teachings.

S. J. Phillips, President of the Booker T. Washington Birthplace Memorial, states that "such a memorial can make a definite contribution to the nation in general and the Southland in particular. Every Southern home should secure at least one of these Booker T. Washington coins. In doing this these homes will be contributing to a program which can contribute to the welfare of both groups today just as Booker T. Washington's philosophy contributed in earlier years."

Phillips said that people in every walk of life, in both groups, are purchasing the Booker T. Washington coin. The coins cost $1.00 each for those minted at Philadelphia and San Francisco, and $1.50 for those minted in Denver, and may be secured from the Booker T. Washington Birthplace Memorial, Rocky Mount, Va.

Showdown Due

An enormous mass of proposed labor legislation has been introduced in the two branches of Congress. And, when it comes to the showdown, the country will find out whether our lawmakers are determined to live up to the pledge they made when running for office.

The basic issue is: Do the alleged "rights of labor" come ahead of the rights, liberties and opportunities of the people of the United States? Labor has gained enormous power - but it has refused to accept compatible responsibilities. It has ruthlessly disregarded the public interest. It has subjected its own membership to what amounts to a dictatorship. Through its excesses it has lowered the prestige of this government in the eyes of the world

The principle of the closed shop must be outlawed by statute. We must reaffirm the principle that every man has the right to belong to a union or not belong, as he sees fit. The law protects the worker against employer discrimination if he is a union man. It must protect him against union discrimination in getting and holding a job if he is a non-union man.

The employer must be permitted to openly discuss labor issues with his workers—precisely as the union leader is permitted to do. The present gag on management in this regard is an affront to every principle of freedom.

Lastly, collective bargaining must no longer be permitted on a scale which gives unions utter and monopolistic power over the production of goods and services. The coal and steel strikes, which almost completely closed those vital industries, show the danger of industry-wide agreements.

These are fundamental points. Congress must also take decisive action on other problems, such as the outrageous "portal-to-portal" suits under which labor claims billions in back pay for work which was never performed.

'Jersey Heifer Chain' Set for Martin FFA Group

Martin, Tenn., Feb. 10—(Special) A "registered Jersey heifer chain," sponsored by the Young Men's Business Club of Martin for members of the Martin FFA chapter, is believed by officials of the project to be the first of its kind in the state. Seven members of the local chapter have received registered heifers and others have made application for animals.

Under the leadership of A. G. Capps, vo ag teacher in the Martin High School, a program was set up whereby the Young Men's Business Club would furnish FFA members with registered Jersey heifers to be paid for with the first heifer calf produced from the heifer.

If a member desires a registered Jersey heifer, he files an application which is reviewed by an FFA commttee. If the committee finds that the boy has the facilities to feed and manage the calf. It recommends to the Young Men's Business Club that the boy be granted the loan of the animal. The heifer is then secured and registered in the boy's name, but the sponsors still hold title to the animal.

The boy agrees to feed and manage the heifer and assume all expenses. He also agrees to return the first heifer calf dropped by the animal at an age equivalent to the animal loaned under the contract. At this time the boy is given a clear bill of sale on his original heifer.

Rural Industrialization Offers Answers to Displacements

Greater rural industrialization and the increasing of smaller farms to adequate size offers a solution to the displacement of farm people by mechanization, says Secretary of Agriculture Clinton P. Anderson in his annual report to President Truman.

He points out that local industries provide rural people with increased employment, better incomes and higher levels of living. Moreover, the benefits are shared jointly by rural and urban people, says the Secretary, in that markets for both industrial and agricultural products are expanded.

Aware of the need for local industries to help balance the rural economy, some communities have taken organized action to improve their local industrial pattern, the Secretary points out. Noteworthy pioneers in this community movement for local industrialization are Fort Smith, Ark., and Anderson, S. C. with the technical assistance of the U. S. Department of Agriculture, these communities have made careful studies of their employment needs and their industrial possibilities.

Emphasizing further the need for increased rural industrialization, Secretary Anderson states that adoption of mechanized farm equipment has reduced the farm manpower requirements. For example, he points out that while four million persons were employed on farms in the South just before World War II, three million, using mechanical cotton pickers and flame cultivators, may be able to do all of the South's farming.

Also, the Secretary points out that many farms are too small or too unproductive to give all of their occupants a good living, because some of the people living on these farms are not fully employed. If some of the under-employed farm people could find nearby industrial jobs, thir problem would be largely solved and at the same time the problem of increasing the size of farms that are inadequate would be less difficult, the Secretary thinks.

A Home Is Burning Now

Somewhere, as you read this, a home is burning. Irreplaceable possessions are being swiftly turned to ash. There is a strong likelihood that someone is dying the most horrible of deaths—cremation alive.

It may be trite to say that your home can be next on the grim list of these disasters. But that is true And if that happens, the chances are the fire will begin from one of four causes. Check your own habits and premises and answer these questions:

First, are you careless with matches and smoking materials? This accounts for 30 per cen of all fires.

Second, is your heating epuipment—stoves, furnaces. chimneys, etc.—faulty? Twenty-four per cent of all fires begin here.

Third, are you careless in using kerosene, gasoline, and inflammable cleaning matreials? They give 12 per cent of all fires their start in life.

Fourth, is there anything wrong with your electrical wiring and appliances? Failure to make repairs in time to this equipment causes 10 per cent of all fires.

If you can answer no to all of the questions asked above, your home is relatively safe from fire. But think, look and inspect before you make that answer. In the case of heating and lighting equipment, have an expert make a periodic check. Don't guess—remember that the owner of that home which is burning to the ground this minute probably thought it was safe too—and he was horribly wrong.

National 4-H Club Week

"Working together for a better home and world community" is the theme of National 4-H Club Week which will be observed March 1-9, Extension Service of the U. S. Department of Agriculture has announced.

Tobacco Expert Urges Care in Seed Handling

By Roy Milton

Tobacco Specialist, U-T Extension Service.

It has been called to my attention that mixed baskets of tobacco have shown up on a number of dark tobacco loose leaf floors during the past season. That is baskets which contained both dark and burley type leaves.

I can't be specific as to the cause of that condition but it is my guess the mixing is done by the grower at the time he sees his tobacco bed. It is becoming a custom for tobacco growers to produce an acreage of both types. Chances are these farmers are not careful enough with the seed which results in burley plants showing up in the dark tobacco-beds and later on the sales floor.

Then, too some of the mixing is done by other than human agents. Each flower has a pistil, the female organ, and each flower produces yellow pollen. The latter may be carried by insects or the humming bird from the flower of a burley plant and deposited on the pistil of a dark flower. What is known in plant breeding as fertilization takes place. You then have a cross. When the seed from this cross fertilized is sown, both dark and burley or a mixture may appear. I can't say how much crossing is done by insects but no doubt some crossing does take place.

Every farmer can overcome this overcrossing by bagging his seedheads. The method is simple, easy and inexpensive.

After the seedheads have been chosen and upper leaves primed let some four or five blooms open. Pull these out as bees may have visited them. Invert and place a paper bag over the seedhead. Mash to stalk and tie securely, using ordinary wrapping cord.

In saving seed, leave only the "crowfoot" in the top, breaking off all lateral blooms suckers as they appear; then when sufficient bolls or pods have appeared, pull out, each week, the new blooms. By resorting to this method, one gets stronger seed and the seed mature more nearly at the same time.

Perhaps some two or three dark tobacco growers—men who would place stress on seed production, like farmers in the burley territory do—should go into the seed production business. No doubt they would find a ready market for pure strains or certified seed.

U. S. to Aid Fight on Cattle Disease

President Truman recently signed a bill authorizing the Secretary of Agriculture to cooperate with the Mexican government in combating the foot and mouth disease that was recently discovered in herds of cattle in that country.

The exact amount authorized to be spent was not fixed but according to livestock authorities in Tennessee, the funds will be limited as compared to the losses that would be suffered should the disease reach the United States.

Though the present outbreak of the disease in Mexico is about 300 miles past our border is not assurance that it will not reach the Western states, Dr. C. E. Kord, state veterinarian, said recently.

USDA Food Deliveries

Recorded deliveries of food products by the U. S. Department of Agriculture to UNRRA, cash paying foreign governments, and other U. S. Government agencies totaled 1,459 million pounds in December. This total compares with November deliveries of 1,094 million pounds.

Clothing Outlook

Plentiful supplies, mere careful buying, eventual lower prices—that sums up the clothing outlook as presented here last week in the U. S. Department of Agriculture to clothing specialists from 42 States and Puerto Rico by representatives of industry and Goverment agencies.

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.

Giles A. Hubert ----------Editor
Sadie Wilson ---------- Secretary
Henry Allen Boyd.---- Publisher
Office, 403 Charlotte Avenue.

Devoted to the interests of the Farmer, Truck Gardner, Livestock and Poultry, Breeder, the Home and the People.

Entered as Second Class Matter, April 10, 1929. at the Post Office at Nashville, Tenn., under act of March 3, 1879.

All contributions for publication in the Modern Farmer, should be addressed to The Modern Farmer, 403 Charlotte Avenue, Nashville 3, Tenn.

No libelous matter will be published. Unsigned articles or letters, and those written on both sides of the paper will not be used.

Subscription price $1.00 per year, 75c for six months, payable in advance. Personal checks must be certified. Make all checks or money orders payable to The Modern Farmer.

Advertising rates and sworn circulation figures presented upon application.

U. S. May Import

(Continued From Page 1)

needs which are not entirely covered by IEFC allocations. The U. S. will exchange domestic oils with Belgium for a like amount of palm oil.

Governmental importation of palm oil and kernels was discontinued as of December 31, 1946. Imports of these products into the United States now are carried out by commercial importers. Also War Food Order 43, which controlled the use, processing, sale and delivery of palm and other high lauric acid oils, was terminated on October 19, 1946. However, the importation of such oils is still controlled by WFO 63, and importers are required to obtain import permits from the U. S. Department of Agriculture.

Negro Farmer Doubles

(Continued From Page 1)

terraces, plowing the slopes on the eontour, and strip-cropping the steeper slopes which were not taken out of raw crops altogether.

Mr. Nappier says that these eonservation measures practically stopped the erosion. During the five years since 1941 when he began buying the farm, his tobacco yield has increased from 960 lbs. on 1.6 acres to 2,200 pounds on 1.3 acres.

"Strip-cropping was one of my main praetices," says Mr. Nappier. "By splicing in small grain crops with my row crops on the slopes, I am able to check the speed of the run-off water, reduce erosion and hold more moisture for my crops," he adds.

J. H. Maclin

(Continued From Page 1)

Maclin turned under a cover crop of abruzzi rye, used 4 tons of barnyard manure and 1500 pounds of 3-9-6 fertilizer, and 200 pounds of 5-5-20 topdressing. The rows were four feet apart with plants eighteen inches apart in the row.

H. L. Maclin, the local farm agent in Brunswick, states that Mr. Maclin has 400 acres of land in three farms and 22.2 acres of tobacco. He used Fermate to control blue mold.

Farms Are Getting Larger

(Continued From Page 1)

there has been an increase of about 12,500 colored and 141,000 white owners in the South. Colored owners in the South now total 186,000.

With the increase in ownership has come a corresponding decline in the number of tenants and sharecroppers. There are now, 19,500 fewer colored and 240,000 fewer white tenants and croppers in the South than in 1940 by census estimate.

The impact of mechanization during the last 25 years has probably been felt most by the operators of moderate-sized farms (100-260 acres) says BAE. It indicates that many of these operators have been forced to buy more machinery in order to successfully compete with the large scale farmers who are rapidly mechanizing. To meet the cost of additional machinery, many operators of moderate-sized farms have had to increase their acreage. Thus they too become larger, leaving less land for the smaller farms.

The small farms (10-100 acres) in some areas are economically the weakest units. While they comprise about half the farms in the country, their acreage has declined from 17 to 11 per cent of the total land in farms. Many colored farmers fall into this category. Census data shows that the average sized farm of Negro farmers in the South is only about 45 acres, while the average sized farm of white operators in this region is approximately 150 acres.

Proper Cattle Feed Important During This Time of Year

This is the time of the year when cattle, especially dairy animals, lose the greatest amount of weight, Lynn Copeland, district extension dairy specialist, said today. The reasans are: spring pastures are not advaneed enough to be of much value and many farmers have "fed out" of hay while others are attempting to stretch their limited supply, he said.

A reason given for dairy eows suffering the greatest loss was that more feed is required during cold weather for body maintenance in addition to that required for milk production. It was pointed out that lice, eattle grubs and other insects take a heavier toll at this time of year.

Farmers were cautioned against feeding grass hay and other low-grade hay to milch cows. Grass hay is costly at any price for this purpose because its nutritive value is very low. Copeland declared. For highest production and desirable body maintenance a good grade of legume hay must be provided.

"It is true many animals finish the winter in a very thin condition which prompts the farmer to think maybe his cows have some type of disease. Missed meal cramps cause a majority of these conditions, Copeland declared. "While economical feeding of herds must be constantly kept in mind there is nothing to be gained through partial starvation," he advised.

The dairy specialist said there were many farmers who are only fooling themselves by grinding low grade grass hay or corn stover, and forcing the dairy animals to eat by mixing a little palatable feed with it. "It is rarely profitable to grind ruffage for livestock," he said.

A farmer who had spent his life in the eountry, retired and moved to the city. On the first morning in their new home, his wife said: "Well, Pa, it's about time you started the fire." "Not me!" he replied, nestling down deeper in bed. "We might as well start right now getting used to all the city conveniences. Call he fire department!"

Miss Sinah E. Kelley

(Continued From Page 1)

the remarkable drug in sufficient quantities to meet the critical need of Allied fighting men during the war.

By the end of 1944, some 21 chemcal companies had taken the USDA laboratory's know how and begun the production of penicillin in large quantities-- about enough to treat serious infections of 250,000 persons per month. The miracle drug is effective against pneumonia, venereal diseases and certain other types of infections.

With increased production of penicillin has come a corresponding decrease in price. Even two years ago the price had been reduced from $20 per 100,000 units to only $3.25. The amount required for a cure ranges from 100,000 to 150,000 units for gonorrhea to a million units or more for most other infections.

Having pioneered the research for the mass production of penicillin, the Northern Regional Research Laboratory is now turning its major interest to other research problems. This laboratory is one of four USDA research centers devoted to the important problem of finding new industrial uses for agricultural products.

Cotton Advisory Committee Named to Assist Research Program

Secretary of Agriculture Clinton P. Anderson named last week the membership of a cotton advisory committee which will assist the Department and the National Advisory Committee in advancing work under the Research and Marketing Act of 1946.

The function of this committee and others to be announced soon will be to review problems bearing on their respective commodities and suggest possible lines of research or marketing services which will aid in the solution of these problems.

The act authorizes expansion of research into basic laws and principles of agriculture along the lines followed for many years by the Department of Agriculture and State Experiment Staions. The legislation also calls for broadening research and services in connection with problems of marketing, transportation and distribution of farm products, including work which has been conducted in cooperation with the States. Special attention would be given to the development of new uses for agricultural products, the expansion of present uses, and the improvement of marketing facilities and services to promote a sound, efficient, privately operated distribution system.

Demonstrate New Type Implements for Negro Farmers in South

Demonstrations of new type farm implements--tractors, combines, flame cultivators, and spraying equipment--are being held by Negro county agents and Experiment Stations in various sections of the South, according to reports received by the U. S. Department of Agriculture from State Extension service Directors.

Through these demonstrations, colored farmers and farm workers are learning how to operate these implements, how to attach the various pieces of equipment to tractors, and how to make some minor repairs. The Department estimates that there may be a million tractors on farms in the South by 1950.

Burley Plant Bed Suggestions Are Offered

Provide 35 to 75 feet of bed 12 feet wide for each acre of burley tobacco and at least 20 feet of bed 12 feet wide for each acre of dark tobacco. Russell Hunt, of the University of Kentucky College of Agriculture and Home Economics, said in a leaflet recently released dealing with tobacco plant-bred management. Other suggestions given were:

Select fertile, well drained land for the bed, preferably with a slight southern or eastern slope, free from shade, especially in the forenoon. This helps prevent blue mold. Using a new site each year also helps prevent disease.

Before steaming or burning prepare seed bed well, so only light stirring will be needed before sowing. Deep stirring may bring weeds.

Fertilize a steamed bed with complete fertilizer at the rate of 40 pounds for each 100 feet of bed 12 feet wide and rake lightly. A low-potash fertilizer such as 4-12-0 is preferable for a heavily burned bed.

Sow two to three level teaspoons of cleaned and tested seed to 100 feet of bed. To distribute seed evenly, mix it with screened wood ashes, fine sand or commercial fertilizer. Going over bed several times, sowing part of the seed each time, assures even distribution.

Box the bed tight, using one-by-six-inch boards. Use a good grade of tobacco cotton. Draw it over the top of the boxing boards and fasten to the sides of the boards. This will keep out flea beetles and cutworms and the tobacco cotton will last longer.

The Worker's Cut

A high proportion of the American people have a terrifically mistaken conception of the earning capacity of industry. And many of those people are the ones who should know better—the workers in industry.

A survey made among thousands of employes of the railroad industry is an interesting case in point. This survey produced two remarkable facts. First, almost all the employes answering believed railroad profits to be far larger than they actually are or ever have been. Secondly, nearly all employes also believ that the railroads should be allowed profits much greater than they ever have received or even asked for.

Here is the way the picture shapes up statistically: The average employe believes the railroads earn a profit of 27 per cent on the value of their facilities. That same average employe thinks that the proper profit should be 10 per cent. And the truth is that the railroads actually earned, in 1945, only 3.01 per cent, and 3.97 per eent in 1944. Only three times in the last 34 years have the lines earned as much as 5 per cent.

The true story of what happens to railroad revenues is an interesting one. A typical large system, for instance, pays out $17 of each $100 taken in, for supplies. More than $9.00 goes for depreciation. Fuel and power, and taxes each take more than $6.00. Bond interest demands about $4.25, and dividends account for something under $4.00. Slightly more than $2.00 is put aside as a reserve. while $5.00 goes for miscellaneous expenses. The balance—about $45.00 out of that $100 earned for service to the public—goes into the pockets of employes in the form of wages.

The railroads are representative of basic American industry. The worker always gets the biggest cut out of the "earnings" pie.

When a woman lowers her voice, its a sign she wants something; when she raises it, it's a sign she didn't get it.

The Real Meaning of "Fireproof"

The National Board of Fire Underwriters, through General Manager W. E. Mallalieu, recently stated that it is concerned with the reaction of the public to the term "fireproof" as applied to hotels.

"Fireproof construction," Mr. Mallalieu continued, as used by the fire insurance industry, is designed to indicate a type of constructon in which the contents of the building can be completely destroyed—and at the same time leave the framework of the building, including the interior, capable of rehabilitation and continued use.

As a result, the word "fireproof" as applied to a hotel, should never be used, regardless of the type of exterior construction, unless all vertical openings, such as stairs, elevators and shafts are closed with partitions and equipped with fire doors. This is the only way to prevent the swift upward travel of fire from one floor to another—which was the primary cause of death and injury in both the LaSalle Hotel and Winecoff Hotel disasters.

Also, Mr. Mallalieu added, in a building properly designited as "fireproof," there must be no transoms, and the separating partition and doorways between rooms and corridors must be of such type as to prevent the ready spread of fire from one of the other. The air-canditioning system must be of a design which will not permit heated, poisonous gases to travel into rooms.

The enforcement of proper "fireproof" standards is a function of municipalities. Where building codes are inadequate and obsolete, as they are in hundreds of towns and cities, the protection of the publie demands their immediate modernization—followed by vigorous enforcement.

Can You Top This One?

Here is a joke that I like:

In a London Club, three men were discussing names.

"Mine," said the first man is, "Edward Henry Patrick Richard Fortesque. I'm sure neither of you chaps can beat that length."

I can," retorted the second. "My name is James Clifford, Percival Ronald Albert Miehael Marshall."

"I beat you both," murmured the third, an Ameriean.

"Eh?" they exelaimed. "What is yours?"

"Mine," answered the American is, "Miles Long."

E. D. Brumfield, R. 5, Box 23,
Tylertown, Miss.

Production Credit

Nearly 400,000 white and colored farmers and ranchmen of the country own an average of $100 apiece in stock in the cooperative produetion eredit associations, C. R. Arnold, production credit commissioner of the USDA's Farm Credit Administration, told members of the 12 district Farm Credit Boards at a recent conferenee in Washington.

Member-owned capital in the production credit association plus accumulated reserves now amount to $76,000,000, Commissioner Arnold reports. This combined figure, he said, has increased at the rate of $7,000,000 a year for the past three years.

Commissioner Arnold reports that credit extended by the production eredit associations in 1946 exceeded $600,000,000, the largest volume of any year since the system was established 13 years ago.

Small grain crops respond to an application of hitrogen quicker than any other field crop. Yields are often increased from 50 to 100 per eent by the use of 100 pounds of ammoniun nitrate per acre.

The Flowering of Socialism

Federal ownership of power is a perfect example of the flowering of socialism in the United States. We have looked askance at Russia's "five-year plans" for government development of industrial activities. Yet our Federal power program is just as Russian from the standpoint of eliminating the individual from ownership and operation of one of line business, as is communism. We criticze England for her program to natonalize her basiv industries. The public power program of the United States has been following England's socialided power program on a piecemeal basis.

Private enterprise and private capital would develop all the power the United States needs, as in the past, if again given a chance.

No Congressman says in good plain English that the more the government goes into business, thereby removing all kinds of taxable assets from the tax rolls, the more remaining taxpayers will have to pay in taxes. And the tax bill is so high that once the aftermath of the boom is over and the country its a flat spot, it will be confiscatory.

Taxes can be reduced if there is a desire on the part of Congress for government to go back to governing get out of business, and cease the practice of taking over the obligations of local governments and financing all manner of local activities, thereby gradually destroying the independence of our citizens. Until somone has the courage to tell a little of the plain truth, because they believe the old American form of enterprise is superior to the pattern of socialism that we are now following under the camouflaged titles, we will remain in the mire of ruinous taxes and continued inflation.

Remember When

By Jesse Safley

Remember a few years ago when about this time of the year we started checking the hens' nests each night to see if the hens were "going to set?" How the old hen that went broody first was considered a prize possession? Not merely because we were especially anxious to have early spring fryers, but the possibility of having the first baby chicks in the community was a cherished thought.

Few will admit it today but at one time or another they have proudly told their neighbors about "taking off" an old hen with 17 or some such number, baby chicks at an early date. The pride that accompanies such a statement is no longer experienced by many. The commercial hatchery which can provide baby chicks almost any week has just about replaced the "old hen," for incubation and brooding purposes—and rightly so!

We don't mean farmers shouldn't provide their baby chicks the old way and it is not our idea to discourage those who do. However, we do think a majority of the farm folk could profit by purchasing day old chicks from dependable hatcherymen.

Our belief is based on the fact that eggs are now demanding a fair price, even to the farmer who sells wholesale. The difference in the value of the eggs necessary to produce 100 chicks and the price one would have to pay for the same number artificially incubated is slight. Certainly it would be meager pay for the effort and risk involved in home hatching.

In the first place, chicks from approved hatcheries have a better chance for a fair start in life than those produced the "old way."

It is difficult to rid broody hens of lice, especially if other hens are allowed to lay in the same nest, which is often the case. One louse on a baby chick at the time it is taken from the nest is enough to retard the chick's growth by several days, because within a short time that one louse has multiplied several times.

The extra trouble involved in the care of "home hatched," chicks is worth considering. It is usually difficult to hatch any appreciable number at one time, which means the chicks will be of different ages. That increases the chance of loss due to the larger ones running over the smaller.

The advantages of growing commercially hatched chicks are numerous, however, one must guard against making purchases from unknown dealers, especially those who offer chicks at bargain prices.

Hatcherymen, like other businessmen, are anxious to satisfy their customers, and it isn't in tune with their program for some one to step out of line and put an undesirable product on the market. A hatcheryman trying to conduct his business fairly will stand behind those chicks he sells. In the hatcheries are signs giving ratings under existing poultry laws. Maybe you don't notice them or possibly they make no difference to you. But they should.

Those ratings were not acquired merely through application. It took work, planning and high type management, all of which must be continued daily if the rating is retained.

A poor quality chick is expensive, even if it is given to you. The prce may not always be a determining factor between good and poor quality chicks, because there are times when the percentage of hatch runs higher than others. In those cases desirable chicks might be purchased at a discount. More often, however, you get no more than you pay for.

There are times when it is risky to buy chicks even though they originally came from dependable a concern. Chicks often become overheated or chilled, are allowed to go too long without feed and sometimes are placed in unclean quarters when they pass through a dealer between the hatchery and the poultryman. A chick that has received such treatment is not worth carrying home.

We recall a farmer who purchased 500 chicks at less than half price because "they were cheap." within three weeks he had lost all of them. His loss was not only the price paid for the chicks but his labor and several dollars worth of feed as well.

On the other hand we don't think it advisable for the average farm flock owner to pay a premium price for special breeds or strains of chickens. That is usually money wasted. A conventional breed at popular prices from a dependable dealer is best.

Now is the time to place orders for chicks if a flock of pullets are expected for next winter's egg production. Records show that one egg in the winter is usually worth two in the spring. Any hen will lay a few eggs in the spring—that's natural. To have a flock that will produce in the late fall and winter takes planning a year or more ahead and envolves continuous care and management.

Starting at the Bottom

Do great business spring full-panoplied into being? The answer is a decisive "No!" They almost invariably begin as extremely small enterprises, financed on a shoestring—and their principal asset is the ambition, ability, and drive of a man with an idea.

Chain Store Age recently ran an article on S. H. Kress & Company, one of the country's leading mass-distributors of merchandise, which vividly illustrates the typically American way in which small business becomes big business. The Kress system began with an idea—the idea being, to quote the article, "to bring finer, luxury goods down to the range of the mass pocketbook. The missing link between the great producing force and the great consuming force was----a new and more efficient form of retail distribution."

That was fifty years ago—a hole-in-the-wall store, and an idea put into practice. People liked the idea because it gave them more goods and better goods for their money. The result is the national system of today which numbers its customers in the millions,.

In all its essentials this is the story of the other great chain systems and independent stores which have grown from one-room outlets with a few cases of merchandise to multi-floored department stores carrying practically anything one can think of. And it will be the story of some merchanising system of tomorrow, whose head is a small and little known merchant today. That is the natural flowering of the American way of doing business, which holds open the door of opportuniy to all.

Farm Talk With Farm Folk

By Jesse Safley

During the past week we have been asked by both farmers and non-farmers the reason for the recent increase in hog prices. Of course, we don't know why—other than there wasn't a sufficient number of fat hogs going to market to supply the demand.

We don't believe there is any reason for the consumer to become alarmed nor do we think farmers should get their hopes too high and expect hogs to sell for 30 cents per pound very long. There are those who won't agree with us and we are not offering a guarantee with our opinion—but a little reasoning should convince them.

In the first place, the consumer will not pay a dollar per pound for bacon and pork chops for a long time as some are predicting they will have to do. Most people learned to do without both during the time OPA was driving the swine producer out of business, and we feel that they will exercise some of the resistance they acquired during that period before they will pay exorbitant prices for pork and pork products.

Another reason why we believe they won't pay the price is because thre is a supply of beef and poultry on the market which was not the case immediately following the end of OPA.

No doubt fat hogs will demand a fair price with a good margin of profit for the next several months at least. But in view of the fact there is an unusually large supply of corn on farms and in graineries, more than will likely be fed during the coming seasons, farmers are not expecting the price to soar at unprecedented levels.

There are those outside the farming business who would like to create an uneasy feeling in public opinion and in turn force government control back on such vital food. That would be drastic indeed. The fact that hog prices increased some 20 per cent is not reason enough for bacon and other pork products to increase 75 to 100 per cent, as some have predicted.

Since the hog producer was so severely "stung" less than three years ago, many will not be so eager to buy back into the business, even when prices are favorable. We believe they are wise in being cautious because records show that hog populations can increase from a shortage to a surplus over a short period of time.

It would be unwise for farmers to dive into an all-out hog production program which would involve the purchase of brood sows at premium prices as was the case in 1943 when $100 was a common price for any female hog, regardless of her breeding background. Many of those same hogs sold for less than $30 each a few months later.

There is a definite need for more fat hogs but much of that need can be met if farmers will exert more effort and save that 35 per cent of the spring pig crop that is normally lost.

We suggest that farmers remain as calm as they have during the past two years, continue to produce on an economical basis, and for consumers to refuse to pay unnecessary high prices, if they should be placed on bacon, lard, and other pork products.

Many Tennessee farmers have learned in the past few years that they obtain greater yields of corn when the fertilizer, at least a part of it, it broadcast over the field and plowed under. They follow with a smaller application in the row at planting time.

Why wouldn't the same method work on garden crops? Most all gardners use a heavy application of fertilizer, especially on potatoes. The same farmers, year after year, have plowed up dry fertilizer at potato digging time. That part of the fertilizer which never disolved in the soil was of no value to the crop. Had the material been applied over the soil and mixed to a depth of a few inches rather than in the furrow, it would have been available for plant food. Why not give the plowing under method of applying fertilizer a trial?

Co-op Store

Chicago Food Market Gives Its Customers All of Its Profits

The most exciting people's movement on Chicago's South Side is symbolized by a seemingly prosaic supermarket. More grassroots in origin than the most sincere tea-and talk interracial committee, more immediately effective than the biggest legal organization, the Altgeld Gardens Co-op Food Store has shown how cooperatives help Negroes to guide their own destinies.

Aware that colored Americans will not be out of slavery even when they can vote, study and live next to their white brothers unless they also achieve economic freedom, 110 pioneer families in the Altgeld Gardens public housing community pitched in about $20 each and started a store. Worth $34,000 today, it grosses $9,000 weekly, expects to turn back to the 1,300 customer-families between twelve and fifteen thousand dollars this year. The prospect made one Altgeld shareholder marvel, "It's like getting a raise without asking the boss."

Of every dollar Americans spend, 59c goes to pay for the cost of distribution. By purchasing from co-op wholesalers whenever possible, cutting down on frills like deliveries, charge accounts, advertising ballyhoo and flashy packaging, by buying only what they can surely sell, the directors of Altgeld save up those extra 59c, average profits of $1,000 a month.

Savings have started in another way: Manager Bowen marks up prices only 18 1-2 per cent, in contrast to other stores which overcharge up to 33 1-3 per cent and return not a cent. Bowen expects a half-million dollar gross for the year Altgeld now has a credit union, hopes next to see a co-op service station then a laundry.

PARASITE CONTROL DEMONSTRATIONS IN STATE SCHEDULED

Much of the $15,457,107 lost by livestock farmers of Tennessee each year through damage caused by livestock parasites, and through death and disease of animals could be saved through good programs of pest control, sanitation, and effective treatment, livestock specialists of the Agricultural Extension Service, University of Tennessee, said today.

In an effort to spread good practices in parasite and pest costrol, two "teams" from the U-T College of Agriculture and the Extension Service will give parasite control demonstratons in 20 or more points over the state beginning tomorrow.

HOME GROWN FEEDS BOOST MILK PROFITS

Growing of good feed at home is one of the most important things a dairy farmer can do to increase the production of milk, according to C. A. Hutton, Extension dairyman, U-T College of Agriculture.

Increased milk production from present dairy herds is one of the main points in programs of the Extension dairy department and the state dairy industry, he said.

Home-grown feeds of high quality not only bring about greater milk production, but do it more economically. Hutton said. Farmers therefore, are urged to consider spring seeding of alfalfa or other legumes for hay. Preparation of land for spring seeding of alfalfa is less expensive than for fall seeding, and is equally successful.

Every milk cow, it is pointed out, should have all the home-grown grazing she will eat. Each needs one to two acres of good permanent pasture, one-half acre of other summer grazing, one-half acre of temporary grazing for the winter and spring months, and one to two tons of good quality legume hay for her year's supply of roughage.

A university professor—one of the absent minded type—was recently awakened by the telephone at 2 a. m. The caller inquired, "Is this one, one, one, one?"

"No," answered the professor. "It is eleven, eleven."

"Oh, pardon me," said the saller. "Wrong number. Sorry I disturbed you."

"That's all right," rejoined the professor. "I had to get up to answer the telephone anyhow.

Canned Goods Crusader

On a national scale, co-ops have been bullied by big business, have been victims of price-wars and suppliers' discrimination.

On a smaller scale, co-ops also find the going tough at first. Bill Bowen recalls that being manager of a bewildered, fluctuating staff in a freezing two-story apartment "store" during the winter of 1944-5 was hard on his temper and on the budget.

But there are good memories, too, like that of the autumn midnight when fifty neighbors with wheelbarrows and baby carriages transported all the groceries from the construction shack which was the co-op's second home into the present super-market. The co-operators went to bed at dawn that day.

Spadework at Altgeld was done by Dick Leekley, white organizer from Council for Cooperative Development who had helped Bill Bowen organize a Minnesota co-op years before. Authorities refused to give him the names of families selected to move into the Gardens, then only under construction, but let him visit a meeting of the residents-to-be. Leekley plunked a table outside the meeting-room, filled it with co-op literature, and ushered everyone into th adjoining room with a "Right this way for the next meeting, folks!" It worked.

Leekley recalls, "Many of the people were from the South, an area as barren of co-ops as it is of any progressive development. Some hadn't ever heard of co-ops. Some couldn't read or write. But they knew they were tired of being cheated and of eating second class food. The co-op idea is a simple one; they voted for their own store." 45 steel and automobile workers were present at that first meeting. Within two weeks a lawyer had drawn up the papers, and the Altgeld Co-op was formed.

In three months, 110 people had raised $2.100 in $15 shares. Two white co-ops sent their good wishes in the form of a $2.500 loan. The money was interest-free: greater love hath no businessman

They had to work fast. Unless the store was ready on the day the Gardens opened, a privately-owned store would get the concession. The Central States Cooperatives' Wholesale sent food enough to stock the two-story store, and at noon, September 16, 1944, the Altgeld Co-op was breathless, but open for business.

Nine months later, construction hand't even begun on the present store; banks wouldn't lend money for building until the lease was guaranteed and six months rent paid in advance. Bowen and his staff worried through six months in a big construction shanty, kept on organizing. An average of three families joined every week. Finally there was enough money, the store was built, and they moved in.

Today the $13,000 debt is being paid off and profits are mounting. The co-op is just beginning to hit its stride.

Grade-labeling has brought peace of mind to Altgeld housewives who, like most Negro shoppers had come to expect second-rate canned goods, fatty meat, exorbitant prices. The "see-through-the-can" label on peas, for example, indicates degree of tendernsss, uniformity of color, condition of skins, flavor, juice. Co-op canned goods are sorted into three grades, priced accordingly. Meats are cellophane-wrapped at Altgeld, tagged with weight and price, placed in "reach-in" glass-topped refrigerators.

SAUSAGE from Parker House arrived at Altgeld Co-op, which purchases whenever possible from non-jimcrow companies. Parker an ex-dining car waiter, started selling homemade sausage to railroads, has since worked up a large and prosperous outfit. Co-op also patronized Gary Broom Company, which Bowen says puts out fine product and employs Negro help. Silvercup bread is now back on shelves since firm agreed to take on skilled Negro secretarial help.

HARRY: "But, dear, don't you want to marry an economical man?"

DORIS: "I suppose so, but it's perfectly terrible being engaged to one."

Americans Eating More and Better, Study Shows

Everybody talks about scarce foods. But the foods America has make better conversation than those it lacks, according to food economists of the U. S. Department of Agriculture.

Here, for example, are some facts about progress in the American diet from 1909 to 1945, gleaned from a study recently completed by the Bureau of Human Nutrition and Home Economics in cooperation with the Bureau of Agricultural Economics.

In 1945, Americans had more eggs, dairy products, citrus fruits, and vegetables per person than ever before. And believe it or not, the per capita supply of meat was the greatest since 1909, except for the one peak year of 1911.

During World War II, as compared with World War I, Americans consumed 10 to 15 per cent more food per person. Diets included more of such "shortage" items as meats, sugar, fats and coffee, as well as more eggs, dairy products, vegetables, and fruits. The food supply was richer in calcium, iron, vitamin A, vitamin C and B vitamins riboflavin and niacin.

Throughout the 37-year period covered by the study, the calcium, riboflavin, and vitamins A. and C in the food supply increased steadily. On the other hand, protein, iron, and V-vitamins niacin and thiamine declined from 1909 to the mid-thirties, then took an upward swing with increasing meat consumption and enrichment of grain products.

Recent improvements in America's food supply reflect high national income and growing response to nutrition education, say the food economists. Another important factor was the enrichment program for grain products. Due solely to enrichment, the 1945 food supply offered 17 per cent more iron, 27 per cent more thiamine, 12 per cent more riboflavin, and 19 per cent more niacin than was the case in the years just before the war.

The cranberry originally was called the craneberry, after the pink and white blossom that resembles the bill, head and curved neck of the wading crane.

West State Yam Growers Harvest Crop

Humboldt, Tenn., Oct. 7—(Special)—Sweet potato growers are busily engaged over West Tennessee in harvesting their 1946 yam crop which is proving to be considerably under the anticipated yield of earlier estimates.

With the approach of frosty weather conditions growers are getting their potatoes out of field and in some sections are storing considerable tonnage while others are selling to brokers at $1.35 per bushel net to growers. The yield for West Tennessee sweet potato crop is estimated to be an average of 50 to 60 per cent of a normal crop which is attributed to unfavorable weather conditions early in the season.

The more fortunate yam growers of Gibson County are finding that their Porto Rico sweet potatoes are selling in competition with the high quality of yams produced by the Louisiana sweet potato growers using only plants from the best quality seed potatoes.

Growers who have qualified under the State Sweet Potato Seed Certification Program for another year are: Ben Ross, Gayle Essary, Wilburn Nelson, Irvin Fly, W. K. Essary, Denton Fly and Harry Smith, all of the Sitka community.

Many thousands of bushels of West Tennessee yams are being stored in the large kiln-drying plants in this section and will sell throughout the winter months. This type of marketing has done much to relieve a congested marketing condition of yams during the "digging time" each year.

Teacher: "What's the fastest growing thing in nature?"

Skeptical pupil: "A fish, from the time my Daddy lands it till he tells about it at our next party."

Good Value for Your Money

Crude oil prices recently increased by about 25 cents a barrel. This was the inevitable result of general price rises extending over a long period of time.

Early in the war the oil industry asked for higher prices and was refused by OPA, in spite of the fact that operations were bound to be more costly under the war economy which preceded it. Since the time that request was made, operating costs have shown still more substantial rises. Labor, for instance, is much more costly. So are most materials. And, most important, deeper drilling and increased exploration activities necessary to the proper development of oil reserves have added to the overall cost.

Output and consumption of crude oil is today at record peaks. As one authority says, "Domestic civilian demand has been phenomenal, especially in view of the dearth of new autos, oil burners, etc., and military, naval, general shipping and export demand has been sustained at levels far above expectations." In order to guarantee a safe reserve capacity, the oil industry has materially increased its expenditures for the exploitation of new fields—and for drilling methods which produce maximum supply with a minimum of loss from any given locality.

The rise in the cost of oil products to the consumer has been well below the general rise in prices. Too, the quality of many oil products, notably automobile lubricants, are being improved, which is in itself an important economy so far as the user is concerned. Superior gasolines, born of war experimentation, are in the offing. As in the past, the consumer is receiving an excellent return for his money.

Life in the Slave State

Those who believe that super-government may have its virtues world do well to memorize this paragraph from W. L. White's recently published "Report on the Poles": "In the slave state a man is told where and how to live and to work, when and for whom to vote, when to cheer and when to boo, and when to scream loudly that his land is the freest and most democratic on all the globe."

The "slave states" did not disappear with the defeat of Germany, Italy and Japan. They survive throughout the world, and some of them are powerful nations. They talk of "security"—which simply means a license to push other people around. They prate of their own brand of "democracy"—which in all essentials is no different from nazism. They shout for the rights of workers—and they treat the worker as a tool, to be used and discarded as the whims and exigencies of the moment may determine.

Super-states inevitably become slave states. All-powerful government inevitably turns into oppressive government. If the American people have learned nothing else, modern history should have taught them that grim fact. The threat to liberty from within is greater, more omnious, than the threat from without. The greatest truth of this age is that those who temporize with freedom by sanctioning centralized, socialistic government, lose freedom.

Care in Curing, Stripping Burley May Pay Growers

Care in curing and stripping burley tobacco this fall may net growers good returns for their trouble, if conditions in the flue-cured markets are repeated when burley markets open, according to Dana G. Card of the University of Kentucky Experiment Station.

A season's summary report on sales of Georgia and Florida flue-cured tobacco in 1946 shows much wider price spreads between the lower and better grades of tobacco this year than last, Dr. Card pointed out. For example, he said that good orange leaf sold this year for $9 more a hundred than low grade of the same color, but in 1945 there was only $1 difference. Good grade lemon primings sold $21 above the low grade while in 1945 the difference was only $1.

"Whether or not similarly wider spreads in price due to quality will appear in the Burley market remains to be seen, but farmers who neglect their crop, thinking that any kind of tobacco will bring a good price, may be disappointed," Dr. Card continued.

In periods when demand is strong, low-grade products usually sell to better advantage than do products of better quality but when supplies are plentiful this condition often is reversed. Large crops of burley tobacco in 1944, 1945 and 1946 are resulting in large supplies on hand. The use of burley has declined somewhat in 1946, particularly for those products which call for lower grades. Conditions in the tobacco market this year therefore, may be such that buyers will discriminate more between good and poor quality grades of burley tobacco than they did in most of the recent wartime years."

Improved Crop Insurance Plan Set For Cotton

Tennessee farmers who apply for 1947 cotton crop will be offered a Federal Crop Insurance on their simplified contract designed to provide coverage more nearly equal to their investment in the crop at different stages of production than in past years.

J. H. Shoulders, state director for the Federal Crop Insurance Corporation, said today the 1947 contracts again will offer protection against loss in cotton yields from virtually all unavoidable causes. The changes in the program for 1947 will be in the amount of coverage the producer may obtain at various stages of production.

"Under the 1947 contracts, each farm will be placed in one of 35 coverage groups according to average yields established for the farm on the basis of past production history," Shoulders said. "Three levels of insurance will be offered in each coverage group, with the farmer selecting the level he prefers. Level A gives the lowest coverage, and consequently carries the lowest premium rate. Level B gives a little larger coverage and costs a little more, and Level C gives the greatest protection and requires the largest premium."

He added that there will be one premium rate for all farms at each of the three levels except that extra hazardous farms will have higher rates. Protection will be increased proportionately as the stage of production advances. There are four stages of production: first, after it is too late to plant cotton, but before first cultivation; second, after first cultivation, but before laying by; third, after laying by, but before harvest; and fourth, after harvest and to the end of the insurance period.

"These revisions have been made in the 1947 program in an effort to provide a simple, clearly defined contract which will give growers the protection they need and at the same time, meet the objective of Federal Crop Insurance as set out by the Congress," Shoulders said.

"The farmer's insurance will be tied closely to what he has invested in the crop. The more time and money he has put into the crop, the more insurance return in case of loss. It never will be more profitable for a farmer to collect an indemnity than to harvest a good crop, but the insurance does offer protection against loss of his investment at a time when he needs it most."

County Agricultural Conservation Committees will have tables showing what each insured farmer's contract covers at every stage of production. In this way, there should be no misunderstanding about the amount of coverage applicable to a farm at any time a loss should occur.

Cotton insurance contracts now are available to farmers in Tennessee, but the closing date, for signing applications for 1947 is March 31. Because of the difference in the 1947 plan of insurance farmers who insured their crop for 1946 and subsequent years will be notified of the changes and given an opportunity to submit a new application. Approximately 3,900 farms in Tennessee were covered by cotton crop insurance in 1946.

53 Million Head Estimated As 1947 Spring Pig Crop

Washington, Dec. 23—(IP)—The Agriculture Department today estimated the 1947 spring pig crop at 53,000,000 head, compared with 52,574,000 in 1946 and a 1935-44 average of 49,941,000.

The department based its estimate on farmers' reports that they would farrow about 8,626,000 sows next spring. This would be about six per cent above both 1946 and the 10 year average.

Pigs born in the spring of 1947 will reach retail markets in the fall and winter of 1947-48.

The department estimated the 1946 fall pig crop at 30,627,000 head, 11 per cent below 1945 and five per cent below the 10-year average. It was the smallest fall crop since 1940.

The department said the indicated increase in the spring crop apparently results from favorable conditions generally, including high pork prices, plentiful feed supplies and a favorable hog-corn ratio.

Keeping accurate production records on cows, and feeding them accordingly is the nearest thing to having them on "piece work."

Watch That Cattle Grub

Livestock producers of Tennessee were warned this week by L. A. Richardson, Extension animal husbandman, of losses due to the insect known as the "cattle grub" which is most active at this time of the year.

Almost every farmer in the state is losing daily either through lower milk production or reduced gains in weight of their livestock, Richardson said. Though these losses can never be figured in exact dollars and cents, they have reached high proportions in our over-all livestock enterprise, he declared.

Richardson said many farmers fail to realize the nature of the insect's life cycle, therefore control methods that would help to reduce the annual loss are often overlooked. "We have become so accustomed to the lumps on the cow's back that we fail to realize the importance of the losses suffered," he continued.

Farmers were reminded there is one way of controlling the fly formed from the grub because it never feeds. It merely lays eggs on the hairs along the lower part of the rear legs of the cow during the early warm days of spring and then dies. The eggs are so small and are attached so firmly to the hair there is no way of effectively destroying them. Thy hatch within a few days and the tiny grub burrows its way through the skin of the leg. It was explained the small larva spends the summer and fall at various places in the animal's body, emerging at the top of the animals back in late December January and February.

The livestock specialist said the only time the insect might be effectively controlled is after the grub punctures the skin in the cow's back.

In the case of only a few cows on the farm the grubs can be controlled by the hand method. The lump containing the grub should be mashed gently between the fingers, taking care not to burst the grub. If it is near the muture stage no trouble will be experienced in removing it. That method will not be adequate in the case of larger herds. An insecticide containing 2.5 per cent to five per cent rotenone will prove effective if properly applied, Richardson said. Some have been successful when the content of rotenone was as low as five tenths of one per cent, it is reported. Richardson advised the use of the insecticide either in a powder or liquid form. Regardless of the type used, at least three applications should be made at one month intervals.

Losses farmers experience from the insect were listed by Richardson as reduction in milk production and weight gains in the spring when the fly is active, and again in the winter when the grub matures. The animal's hide is often made worthless due to the holes left when the grub emerges. Several pounds of beef are lost when the paker is forced to cut the grubs out of the carcus.

The price paid for cattle seriously infested with the insect is often reduced as much as three dollars per 100 pounds.

BAD MEDICINE!

"Socialized Medicine—Bad Medicine for You!" That is the title of an extremely effective article by Michael Wrigh appearing in Better Homes & Gardens.

Mr. Wright describes how socialized medicine works in Britain, where a single, disinterested doctor wll dispose of as many of 40 patients in two hours. He points out that in most communities here are agencies, clinics and hospitals that provide free or low-cost care for the needy. He observes that under socialized medicine, where there is no direct cost to the patient involved, hypochondriacs will swamp the doctors whether there is anything wrong with them or not, thus depriving people who really need treatment of the proper attention, and discouraging the physician. Then in conclusion, he lays down in words a philosophy that should be the solid foundation for medical care legislation and policy.

"A person who needs help should have it," he writes. "But not in a manner that will tear down the quality of medical care to the rest of us.

"Not in a masner that will destroy private practice.

"Not in a masner that will destroy the voluntary hospital system

"Not in a manner that will give man control over medical research and education.

"Not in a manner that will bind the physician to political slavery."

There can be no more effective argument against socialized, regimented, or bureaucratized medicine than that. Let the nation remember it.

The State Extension clothing specialists are attending a two-week refresher course on the latest developments in the clothing field, especially new fabrics and finishes. The course is being conducted by the Extension Service with the Bureau of Human Nutrition and Home Economics of the Deparment cooperating.

Discussing the outlook for fibers, fabrics, and clothing at the opening session, A. W. Zelomek, presiden of the International Statistical that the American public will spend fewer dollars and buy fewer garments in 1947 than in 1946 although Bureau, Inc., New York, forecast supplies will be plentiful.

Shoe production almost as high as the 1946 all-time record was predicted by Edward L. Drew of the Tanners' Council of America, New York. Concerning shoe styles, Drew said that more shoes with closed toes and heels would soon be on the market.

Shrink and flame resistant and other special finishes being developed by government and industry for military use were discussed by Stanley Backer, chief, and Allan McQuade and Louis I. Wainer, technologists, representatives of the Philadelphia Quartermaster Depot's textile research branch.

The increasing availability of wool clothing which may be put in the family washing machine or sent to a commercial laundry without fear of felting shrinkage was forseen by Weiner as a result of the research now underway.

McQuade said that some flame-resistant finishes developed at Columbia University under the sponsorship of the National Research Council can be applied to household fabrics used for draperies, cotton rugs, and unholstry.

More motor trucks are used in the distribution of milk than any other commodity. Approximately 100,000 trucks are used daily for that purpose.

What Is Value?

Our reaction to the price of any commodity is naturally conditioned by past experience. Anyone who compares today's prices, for example, with those of 1941 or 1936, is due for a shock. And it is easy to get into the habit of thinking that "normal" prices, to which we will some day return, are those of a vanished year in which a five-dollar bill would do a job that it takes a ten or twenty to accomplish now.

The hard truth of the matter is that prices are not going to return to the remembered lows, short of an economic debacle of the utmost severity. We have, for example, some $260,000,000,000 worth of Federal debt, which in itself is an inflationary factor. We are paying record wages to all classes of labor, and in many important fields, output per man hour has declined while costs have risen. We are fastened with the highest taxes, corporate and individual, in our history, and these are reflected inevitably in all prices. We are, in short, living in a high-priced economy, and there can be no valid comparison of the present with the past.

The best we ean hope for is honest value—which is simply the lowest prices, quality for quality, commensurate with the conditions of the times. The American merchant, whether he operates a little crossroads store or an outlet for a national chain system, is the consumers' most dependable friend in giving us that. He is the man who pares his operating costs in order to hold price raises to the minimum, and to lower prices when he can. He is the man who buys with care, so that the customer will get the most for his money. He ean't perform the impossible—but he ean and does do all in his power to protect the purchasing power of that green folding stuff you carry in your wallet.

Ladies, Wax Your Bag

Spring showers may leave their mark on new leather handbags, especially those with a smooth finish. Clothing specialists of the U. S. Department of Agriculture suggest turning off raindrops and also soil by waxing surface of the bag. They advise applying an even coat of good quality floor or furniture wax letting the wax dry, and polishing thoroughly with a clean soft cloth, then repeating the proeess 24 hours later.

Wax not only helps to protect the leather from Stains but also helps keep it from drying out and losing its flexibility.

Stores Raise Living Standards

It takes a great war, with its unprecedented drain on our labor and resources, to reduce this country to an economy of scarcity. In normal times, the average American consumer enjoys the fruits of an economy of abundance.

Retail stores present an accurate gauge of our unprecedented living standards. Every kind and charaeter and quality of goods is found on their shelves. The needs of all tastes, all pocketbooks, have been anticipated and met. That is not true of any other country. Abroad, good stores are usually found only in the larger cities, and they are patronized most extensively by people of relatively large income. The person who lives in the village has small choice when he goes to market.

Chain systems and progressive single unit stores must be given credit for the present scope and efficiency of American retailing. They reach into the smaller centers of population, and offer consumers selections of goods comparable tothose found in big cities. No matter where you live, regardless of the distance from the manufacturing areas, standard goods of known quality and value are immediately available.

The retailer is the consumer's link, with the vast American production machine. Without that link, the abundance made possible by mass production would be denied to millions. The store, like the factory, directly affects the well-being of us all.

The Growth of Prepaid Medicine

Prepaid medical care plans of one kind or another are making spectacular progress, according to a survey published in Medical Economics.

The leader in the field is naturally the old established Blue Cross organization, which started in 1934 On September 1 last, its coverage totaled 24,000,000 people.

The most rapid growth is being made by state medical care plans approved by medical societies. They are of recent origin for the most part—of 51 in operation on September 1. 21 started during the last two years. These plans were subscribed to by more than 4,000,000 people as of September 1—a jump of 45 per cent since the start of 1946.

The support that the medical profession is giving the plans is shown by the fact that 75,000 doctors more than half of all physicians in private practice, are participating. Furthermore, coverage will soon reach almost the entire country—as of a recent date, only three small states had no medical care plan in operation or preparation. And it is estimated that the number of people eligible for coverage will reach 100,0000,000.

Here is the answer to those who say that private medieine has done little to make its services available, at reasonable cost, to the rank and file of the people. While the cost of prepaid medicine varies from state to state, in all cases it is remarkably low a few dollars a month for the average family. The extent of the service offered has also been steadily increased. Prepaid, voluntary medicine is the best solution yet suggested to what ever medical care problems we have.

Taxation and Monopoly

When Congress finally gets down to cases on what is to be done about government expenditures, the national debt, and taxation, it should look squarely at this grim fact: the small and medium-sized enterprise is taking the worst beating under present tax policy.

The big business, with reserves of capital built up over many years, is better able to look out for itself. But the small business with its current tax burdens, cannot obtain and keep the wherewithal necessary to rapid expansion. Money that, in past times, would have gone for new plants, new developments, new employment, now goes to the tax collector.

Senator Cordon of Oregon put the issue well when he said that, once we make it impossible for the small concern to progress and reach its proper place in the economic sun, we are paving the way for monoply. And monoply is the surest road known to socialism--with its destruction of all traditional American freedoms.

The tax structure must be revised to permit all enterprise to grow, to compete, and to become big if it has the capabilities. That is the way this nation was built. That is the way we became the world's greatest and ricest power in a century and a half. A tax system which says, in effect, "small business must remain small," will prove ruinous to all.

Yerba Mate

Although practically unheard of in North Americea, one of the most popular drinks in South America is the aromatic and stimulating beverage known as yerba mate. Indigenous to the Western Hemisphere, the yerba mate plant supplied the favorite beverage of the Guarani Indians before the Spanish conquest of Paraguay and the Portuguese settlement of Brazil, says the March issue of Agriculture in the Americas, a USDA publication.

New Yorkers may watch the construction of a new sky-scraper, Air Lines Terminal, through holes bored in the surrounding fence—at various heights to accommodate people of all sizes. Close to the sidewalk are holes marked: "For Dogs Only"; one speeifies "Pekinese."

Proper Soil Techniques Are Discussed

Importance of correct land usage and the value of commercial fertilizers and lime on all crops including pastures was expressed by members of the Bedford County Soil Conservation Association and the Lawrence County Test Demonstrative Association at their annual meetings recently.

The 70 members and guests of the Bedford County organization heard John Joss, one of their fellow members, tell how he produced as high as five and one-half tons of alfalfa per acre with an average annual yield of three and one-half tons per acre over a period of five years. Joss said an analysis of the alfalfa showed that hay on the properly fertilized land was worth three times as much for feed as that grown on a check plot in the same field.

Joss advised farmers to have all soil tested; follow recommendations of the soil analyst in applying fertilizer, and to produce more small grain and legume crops instead of row crops.

John Crigler of the Bell Buckle community cited the importance of community organization. Bell Buckle was first prize winner in the Bedford County Improvement Contest last year and was rated eighth in the Middle Tennessee competition. "No doubt the interest in the contest was responsible for many additional acres of small grain and crimson clover in our community," he said.

Mrs. Eldridge Whitworth of the Vannatta Community stressed the importance of farm women interesting themselves in all farm programs. "In our community when a farm program is being discussed the women are considered," she said.

Members of the Lawrence County group heard Hobert Plunkett say "the most valuable tool on my farm is the peneil I use in keeping records of my farm operations." Plunkett began his record keeping in 1940. One of the first things he discovered was that two of his seven dairy cows were not producing enough to pay for the feed consumed. Those animals were replaced by profitable producers, and last year his net income averaged approximately $190 per cow.

"We hear farmers say they can't afford to feed hogs but we have never failed to show a fair profit on hogs, and we have records that will prove this," Plunkett declared.

W. H. Polk, another member of the Lawrence County Association, said that 18 acres of sweet sudangrass increased his milk receipts during a 60-day period in 1946 nearly $500 over the same period the year before. Polk cautioned the farmers against poor pasture during summer months.

The value of large applieations of commercial fertilizer on corn was emphasized by Henry Lamprecht who last year increased his corn production from 32 bushels per acre to more than 70 bushels per acre. He turned under some 500 pounds of 3-9-6 fertilizer and about 150 pounds were drilled in the rows at planting time. Lamprecht believes heavily fertilized corn wll withstand more dry weather and that fertilizer plowed under is worth more than when applied by other methods.

Others appearing on both programs were Miss Helen Cullins, district home demonstration agent; A. B. Harmon, district extension agent, and N. B. Morgan, assistant extension farm management specialist.

All officers and directors of the Lawrence County Association were reelected. They are R. M. Benson, president; W. H. Hyde, vice president: W. H. Polk, secretary-treasurer; W. R. Pollock and W. B. Alexander, members of the board of directors

E. M. Dement was reelected president of the Bedford County group, John P. Crigler was named vice president and Miss Lois Wiggs, secretary-treasurer. Elected to the board of directors were J. V. Hastings, Jr., Mark Hix, Mrs. Eldridge Whitworth, H. V. Stephens and C. A. Molder. The work in Bedford County is supervised by James D. Taylor, assistant county agent, while Frank Yergen, assistant county agent in Lawrence County, directs the work there.

The Importance of Fescue Grass No. 31

The importance of Kentucky Fescue Grass No. 31 as a pasture and soil erosion control crop has created much interest among farmers in Middle Tennessee during the past few months. Groups from various counties have visited farms in Kentucky recently to observe the crop under growth.

We accompanied several Rutherford County farmers who visited two Kentucky farms last week. One was the Arvin brothers, farm near Guthrie; the other was the Lilly brothers' farm near Hopkinsville. This was our first opportunity to see a crop of the grass.

It was very evident the farmers in that section are "sold on the idea" the grass is most desirable. Not because the seed produced is salable at a very attractive price, but they have found it to be a hardy crop both winter and summer, a good pasture crop, and will prevent soil from washing.

One of the most striking demonstrations on the Arvin farm was a badly eroded and gullied hill which has been seeded to the grass for only a year and a half. The gullies which were five feet deep in some places were partially filled before the grass was seeded. That was in October, 1945. Today there is no sign of washing. This is true in spite of the fact the grass was grazed all fall and winter.

On a 60-acre field of the grass 80 head of cattle ranging in weight from 800 to 1,100 pounds grazed from September until the middle of January when sold on the fat beef market. That field produced good grazing for nine months in 1946. The livestock was removed in early April to allow the grass to seed. An average of 1550 pounds of seed per acre was harvested.

Another characteristie of the grass which should be pleasing to most farmers is that it will produce on soil that is not particularly fertile. Like other crops, however, it will produce more on fertile land.

On the Lilly farm the Rutherford farmers were very impressed that grass thrives well on wet land. There only a few acres remain wet most of the year. Part of that area was covered with water when we were there, and th grass had grown well. One of the Lilly Brothers said that area had been under water for more than six weeks. In places the grass had grown out of the water as much as six inches.

It is the Lilly's opinion that the grass will grow well in a combination with ladino clover. The had a small area of the mixture which has proven satisfactory, but believe the clover should be given a little edge on the grass. Suggested as the normal rate of seeding for the clover: two pounds per acre and about six pounds of fescue seed which is approximately one half the normal rate of seeding.

The Rutherford farmers were favorably impressed with the pastures they saw. Most of them placed orders for seed to be delivered next fall—only with the hope the producers might be able to fill the orders. The demand has increased to such proportions the Kentucky growers are unable to supply all orders.

James Haynes, one of the leading farmers of Rutherford County, said he believed the grass would be more sensational than lespedeza. "I doubt if there is a farm in Middle Tennessee that doesn't have at least a few acres of lespedeza," Haynes said.

Jennings Jones, another Rutherford farmer said he was sold on the grass from what he saw in one day. Jones placed an order for enough seed to sow several [illegible]

Mac Looney, soil conservationist for the county, said he was "sold" on the grass. Looney thinks there is definitely a place for the grass on Rutherford farms and is planning to assist farmers in introducing it.

As yet the U-T experiment station has no report to make on the value of the grass but experiments were started the past fall—and according to John Ewing there will be a progress report available within a year. Their experiments include a comparison of the Fescue with orchard grass and blue grass as pasture crops, the seeding of Fescue with alfalfa and other legumes for pasture purposes, and the growing of the grass on an extremely wet area.

Ewing believes fescue will prove to be a desirable crop and will compete with some of the old stand-by crops. in pasture and erosion control-programs.

Altgeld Co-op Wields Buying Power to Win Job Equality Too

When Negro rights are threatened, the Altgeld Co-op sticks its chin out.

Silvercup Bakery learned how 300 Negro business-owners can use economic power to bolster the four freedoms when they turned down Mary Blake, who phoned in a reply to their ad for a typist and comptometer operator. The job was just about in the bag when Mrs. Blake offered the information that she was colored. After repeating "Are you sure?" and "But Negroes don't live near your address", the voice on Silvercup's phone lost its cordiality, withdrew the invitaton for an inverview.

As soon as she told Bill Bowen, he grabbed the phone, cancelled his Silvercup order, and painted a large sign explaining to consumers that as long as Silvercup insisted on barring Negro office workers they would have to forfeit Altgeld's yearly $7,000 order.

Floury officials righteously announced that 25 per cent of their workers were Negroes, paraded lists of porters, janitors and truck-washers to prove it. Bowen, aware that his store was Silvercup's second largest retail outlet in Chicago quietly held his ground. The co-op triumphed when Mrs. Blake was hired as a demonstrator and another Negro became a comptometer operator. Under insistent co-op pressure, the company is seriously considering hiring Negro sales managers, drivers and salesmen.. The bread is back on Altgeld counters, with sales at a new peak.

All of the 21 workers on the co-op staff live at Altgeld, own or are buying stock. Altgeld's staff was encouraged by management to organize; all are members of CIO's United Retail Workers.

Growing importance of the Gardens as a food outlet has led many companies to make large offers for selling rights. Bowman Dairy offered to install refrigeration equipment and make a flat contribution of $600 if the co-op would handle only their products. Altgeld refused, sells co-op milk exclusively.

Manager Bowen and the directors look forward to the day when Altgeld and all Negro communities will achieve the independence of Tyrrell, N. C. They tell with pride of the town which got up a co-op loan fund, paid off loan sharks, rebuild burnt homes, lent $42,000 in seven years. After a co-op store came a hospital association, then a sorghum mill for cheap sugar. Now a 680-acre farm has been bought, playgrounds, education centers and a swimming pool laid out; on weekends Tyrrell fathers and sons build with lumber from a co-op sawmill. under the direction of a co-op hired carpenter. In a few months each family will move from a shack into a home, with indoor plumbing and a room for each person.

Prize Load Of Seed Cotton Nets 4 Bales

Dresden, Tenn., Dec.—23—(Special)—A truck loaded with seed cotton that ginned out four regulation-size bales attracted much attention in Dresden last week.

C. E. Parks, Liberty farmer came into Dresden with what is claimed the largest load of seed cotton ever delivered to a ginner here. There's a story back of it, too. Last April when the weather was anything but favorable for a profitable cotton yield, Parks seriously considered plowing this four-acre patch of cotton under. There was a poor stand, grass was taking it and no time left from other field crops to cultivate the cotton.

Finally, however, Parks did get around to the cotton which did yield fairly well—the truck load delivered here Tuesday netting him $1,200. In addition Parks carried home 1,000 pounds of seed, in addition to seed sold to the ginner.

WOMAN'S PAGE

Consider the Egg

Nothing so small contains so much food value, nor does anything challenge it for first place, as a glance through any cook book will reveal

By Mary Lyles Wilson

A glance through any cook book is enough to convince anybody of the indispensability of one of the smallest foods we use, the egg. Probably no other article of food is so widely used. The food value of eggs and their ease of digestion entitle them to first rank, and certainly there is more in their favor than flavor.

"Every day eat eggs some way" is a slogan we might bear in mind. Consider them at breakfast as a sunny starter for the day, at noon to give punch to your salad or sandwich lunch, at dinner in a light dessert.

There is no stouter food, no fitter fuel to nourish youthful ambitions or to sustain mature activities than the simple but well-nigh endless variety of egg and egg-combination dishes. For all of their sturdy qualities, eggs require tender treatment. They must be properly stored, kept cool at a temperature between 45 and 55 degrees. They should be covered to retain their delicate flavor (protected from the odor of other foods). Special care must be taken in their preparation. Low temperature and slow cooking are two of the requirements for best results when preparing egg dishes. For many years, eggs were considered chiefly an item on the breakfast menu, fried, scrambled, boiled or poached. Now eggs have taken their place as a principal food in every meal.

In placing eggs on the breakfast menu, there are many delightful ways of varying this every-popular food. For that "boiled egg", let's steam them for a change. Here is the way to do it.

Steamed Eggs

Eggs 1/2 cup water

Place the number of eggs desired in saucepan. Add the water and cover. Turn on high until steaming (three to five minutes). Turn heat off and steam the eggs without removing the cover—three four or five minutes. For hard-cooked eggs, steam 25 minutes. If eggs are taken from the refrigerator, allow three to five minutes longer, cooking period.

Fried or Buttered Eggs

Fried or buttered eggs are rarely cooked to perfection. When done, the white should be almost translucent, gelatinized and the edges of the egg a pale yellow, not brown and tough. This can be accomplished by using a low controlled heat. Select a smooth frying pan and use sufficient butter or fat to oil the pan well. Heat pan until warm. Break eggs into a dish. Carefully pour the eggs into buttered pan Add one teaspoon hot water to each egg and cover. Cook covered, three to five minutes. Serve on hot plate. Garnish with paprika and parsley.

Delicious Scrambled Eggs

3-4 cup top milk
6 eggs
4 tbsp. butter
1-8 tsp. pepper
1 tsp salt
Paprika

Heat the milk and butter in the frying pan with heat turned high. Turn low. Beat the eggs with a fork. Add the salt and pepper. Turn the eggs into the pan with scalded milk. Cook, stirring frequently until set. Serve garnished with paprika and parsley. For savory scrambled eggs, add one-half teaspoon onion juice, two tablespoons Worcestershire sauce and two tablespoons minced green peppers the last minute. You can also utilize odds and ends of cooked meats or vegetables.

One dish enjoyed the world over is the: omelet. Romances have flowered on the airy delicacies of an omelet, and she who masters its simple intricacies shall never want for admirers at her board. ,

Puffy Egg Omelet

4 egg yolks
3 tbsp. milk
3-4 tsp. salt
4 egg whites
1-2 tsp. baking powder
2 tbsp. butter

Measure butter and place in frying pan. Cover and turn to low. Heat pan for five minutes. Separate eggs, beat the whites until stiff. Beat the egg yolks add the milk baking powder and salt and mix well. Combine the egg yolk mixture with the beaten whites, folding in carefully. Pour mixture in frying pan, cover and cook for five minutes. Remove the cover after five minutes and continue to cook six or eight minutes. Cut through the center, fold over and serve on hot plate. Garnish as desired.

Variations

Spanish Omelet—After the omelet is on the plate, pour over a sauce made of tomatoes, green peppers, salt, butter and pepper. Garnish with parsley.

Mushroom Omelet—Saute one cup of fresh or canned mushrooms in butter. Season with salt, pepper and bit of mace.

Ham Omelet—When the omelet is cooked one-half the required time, sprinkle minced ham or dried beef over the omelet. Fold and serve.

Chicken Liver Omelet— Chop chicken livers. Saute in butter. Season with salt, pepper, and Worcestershire. Pour over the omelet just before serving.

Cheese Omelet—Just before folding the omelet, sprinkle with one-half cup grated cheese.

Shrimp Omelet—Serve sauted shrimps around the omelet and garnish with lemon and watercress.

Parsley Omelet—Add two tablespoons minced parsley when folding in egg whites.

The French omelet differs from the fluffy omelet in the amount of beating required. In making the French omelet, the eggs are slightly beaten unseparated, while, as you note, the fluffy omelet requires more air beaten into the egg yolks and whites separately. The same variations may be used in either kind of omelet. The fluffy omelet is more economically used as a foundation recipe.

French Omelet

5 eggs
2 tbsp. butter
Salt and pepper

Break eggs into bowl; beat until yolks asd whites are well mixed, add salt and pepper. Melt one tablespoon butter in skillet. Melt the other tablespoon butter and add to mixture. Pour mixture into the skillet; prick with a fork carefully. When thick and set, fold over, brown. and serve on hot dish. Serves four.

As the main part of a salad or to accompany other foods, eggs are perfect. A luncheon salad equally appropriate for a buffet supper is the one spoken of today.. In the center of platter, arranged on a bed of crisp lettuce, are wedges of unpeeled tomatoes and thick slices of avocados. Garnish with well-seasoned mayonnaise and halves of hard-cooked eggs, which may be served plain or stuffed.

When we come to desserts, eggs are always used. What cake, pie, or creeam is as good without that golden nugget of food that our good friend, the hen furnishes us, The butterscotch pie made by this recipe:

Butterscotch Pie

1-2 cup sugar
1-4 cup water
4 tbsp. butter
1 3-4 cups scalded milk
3 egg yolks
1-4 tsp. salt
1 cup brown sugar
1-4 tsp. salt
1-2 cup cornstarch
1-4 cup cold milk
3 egg whites
6 tbsp. sugar

Caramelize the one-half cup of sugar on low heat. When caramelized add the water and butter. Allow to dissolve. Scald milk and add to caramel mixture. Beat egg yolk, add brown sugar, cornstarch, salt and cold milk. Add mixture to hot milk—cook until thickened stirring constantly after mixture begins to thicken. Pour into a baked pie shell and cover with a meringue made of egg whites and sugar. Bake in- 325 degree over 1220 15 minutes.

EGGS AND MUSHROOMS WITH CHEESE SAUCE

4 hard-cooked eggs
4 chopped mushrooms
1 teaspoon chopped pimiento
2 tablespoons cream
1-2 cup soft bread crumbs
Salt
Pepper
Toast
Bacon
Cheese Sauce

Cut hard-cooked eggs in halves crosswise and remove yolks. Mix mushrooms, pimiento, cream and soft bread crumbs together, seasoning with salt and pepper to taste. Heat mixture until very hot over hot water and stuff into the whites of eggs. Place them on toast and cover with cheese sauce. Place in 350 degrees oven until sauce bubbles. Garnish with bacon. Serves 4.

CHEESE SAUCE

3 tablespoons bacon fat
3 tablespoons flour
1 1-2 cups milk
1-2 cup cheese, grated
4 hard-cooked egg yolks

Blend flour and bacon fat and when smooth add milk. Stir until sauce boils and add cheese and egg yolks rubbed through a sieve.

LIMA BEAN CASSEROLE

2 cups dried lima beans, large size
1 small onion
2 tablespoons fat
2 cups diced smoked ham, bologna or spiced meat
2 cups tomatoes
1 teaspoon salt
1 1-2 teaspoons prepared mustard
2 teaspoons Worcestershire sauce, if desired

Soak the lima beans in water over night. Simmer in the same water until tender, then drain. Brown the sliced onion in the fat and add to beans. Add all other ingredients and place in casserole. Bake in moderate oven one hour.

SUNDAY NIGHT SAVORY SANDWICHES

Serves Four)

1-2 pound liverwurst
2 teaspoon prepared mustard
2 to 3 tbsps. Blue Plate Mayonnaise
4 slices bread

Mix liverwurst and mustard with sufficient Blue Plate Mayonnaise to spread easily. Spread bread with mixture, top with cheese, and broil until cheese is melted. Serve hot. (Blue Plate Mayonnaise adds a tempting, sweet-tart flavor to all your sandwiches— makes them taste really super-special. And it's guaranteed to be flavor-fresh.)

CHERRY BETTY

2-3 cup flour
2-3 cup brown sugar
2-3 teaspoon cinnamon
3 tablespoons butter or margarine
2 cups canned sweetened cherries
1-2 cup cherry juice

Mix the flour, brown sugar and cinnamon together. Work in the fat until the mixture is crumbly. Place the cherries and juice in a greased cake pan cover, with the crumbly mixture. Bake in a moderately hot oven (375 degrees) for about 30 minutes. Serve with cream. Berries or other fruit may be used instead of cherries.

CHICKEN-PINEAPPLE ASPIC

2 envelopes (2 tbsps.) unflavored gelatin
2 cups chicken stock
1-2 cup cold water
2 tablespoons lemon juice
2 teaspoons salt
3-4 cup diced celery
2 cups diced cooked chicken
1 cup cubed canned pineapple
1-4 cup chopped green pepper
2 tablespoons chopped pimiento

Soften gelatin in cold water, dissolve in hot chicken stock. Add lemon juice and salt; chill until syrupy. Add remaining ingredients pour into mold rinsed in cold water chill until firm. Unmold. Serves 4 to 6

BRAN BROWN BREAD

1 egg
1-3 cup sugar
1-2 teaspoon soda
1-3 cup molasses
1-1-2 cups bran
2-3 cup cornmeal
1-4 cup melted shortening
2 1-2 cups sifted flour
2 teaspoons baking powder
3-4 teaspoon salt
1 1-2 cups milk

Beat egg, add sugar and mix well. Dissolve soda in molasses and add to first mixture; add bran, cornmeal and shortening. Sift flour with baking powder and salt; add to first mixture alternately with milk. Stir only until flour disappears. Pour into greased loaf pan. Bake in moderate oven (350 degrees) 1 hour and 15 minutes. Remove from pan and cool before cutting.

NABISCO BRAN PECAN MUFFINS

1 cup Nabisco 100 percent Bran
1 cup milk
2 tbsp shortening
1-4 cup sugar
1 egg, beaten
1-2 cup chopped pecans
1 cup sifted flour
3 tsp. baking powder
1-4 tsp. salt
12 whole pecans

Add bran to milk and let soak 5 minutes. Meanwhile, cream the shortening and sugar thoroughly; add egg and beat until smooth. Add chopped nuts to bran mixture. Sift together flour, baking powder, and salt. Add to bran mixture and stir only until blended. Fill the greased muffin pans 2-3 full; top each with a whole pecan. Bake in hot oven (400 degrees F.) about 25 minutes. Makes 12 muffins.

RAISIN PUFFS WITH CHOCOLATE SAUCE

2 tablespoons melted shortening
1 cup coarse dry bread crumbs
2 eggs
2 tablespoons sugar
2 tablespoons light corn syrup
1-4 teaspoon salt
1 1-2 cups milk
1-2 teaspoon vanilla
1-2 cup raisins

Combine shortening and bread crumbs. Beat eggs slightly, add sugar, corn syrup and salt. Stir in milk and vanilla until well blended. Add raisins and breadcrumb mixture. Let stand a few minutes before baking. Pour into greased molds and bake in moderate oven (350 degrees' for 30 to 40 minutes, or until a knife comes out clean when inserted in center of puddings. Remove from oven and let stand for few seconds. Turn out on dessert plates and serve with Chocolate Custard Sauce. Serve either hot or cold. Serves four.

Chocolate Custard Sauce

2 squares unsweetened chocolate
2 cups milk
1 1-2 tablespoons flour
1-3 cup sugar
1-3 cup corn syrup
1-8 teaspoon salt
2 tablespoons butter or margarine
1-2 teaspoon vanilla

Add chocolate to the milk and heat in a double boiler. When chocolate is melted, beat until mixture is smooth. Combine flour, sugar, corn syrup, and salt. Stir in a little of the chocolate mixture and return to double boiler. Stir constantly and cook until thickened. Add butter or margerine and vanilla. Serve hot or cold.

S m o r g a b o r d means butter, cheese and bread. These three foods are basic in the Swedish diet, and were offered to the guest as soon as he arrived. This act of welcome resembles the offer of salt and black bread by the Russian peasant.

EASY IDENTIFICATION

Keep your linens straight and your closet neat. Identify single sheets with a tiny "x" mark made with one color of thread, mark double sheets with a contrasting color.

STUFFED ROUND STEAK

1 1-2 pounds round steak
1 teaspoon salt
1-8 teaspoon paprika
1-4 cup bacon drippings
2 tablespoons chopped onions
1 cup bread crumbs
1-4 teaspoon salt
Few grains paprika
2 tablespoons chopped parsley
3 tablespoons chopped celery
1 egg slightly beaten
3 tablespoons bacon drippings
2 tablespoons flour
1 cup water
1 cup tomato juice
1-2 teaspoon salt

Have round steak cut about three eighths of an inch thick. Season with one teaspoon salt and one-eighth teaspoon paprika. Melt bacon drippings, add onion and saute until brown. Add bread crumbs, salt, paprika, parsley, celery and egg. Mix well and spread over steak. Roll loosely and tie. Heat three tablespoons drippings in skillet and sear steak in it on all sides. Remove steak to casserole. To the drippings in skillet add flour and when blended add water, tomato juice and salt. Pour over steak in casserole, cover and bake in slow oven 250 degrees, for one and a half hours. Add more seasoning if required.

CHICKEN AND ALMOND SANDWICHES

Mix equal quantities of chopped white meat of cooked chicken and chopped blanched almonds. Mash to a paste. Season with salt and pepper. Add enough mayonnaise to make of the right consistency and spread on thin slices of buttered bread. Put together with lettuce leaf. Trim and cut into desired shapes. Garnish platter with clusters of watercress and pickle.

APRICOT ICE CREAM PIES

Place canned apricots in small individual baked tart shells. Cover with vanilla ice cream and then cover completely with a meringue made by beating three egg whites until stiff, adding gradually three tablespoons of sugar and half teaspoon of vanilla. Place in a 450 degree oven for one minute to brown delicately. Serve at once upon removing from oven.

SPICY PRUNE CAKE

2 cups sifted flour
1-4 teaspoon soda
3 teaspoons baking powder
1 teaspoon cinnamon
1-4 teaspoon nutmeg
1-4 teaspoon cloves
1-2 cup shortening
1 cup sugar
2 eggs beaten
3-4 cup milk
1 tablespoon grated orange rind
1 teaspoon vanilla extract
1 cup chopped cooked prunes
1-2 cup chopped nuts

Sift together flour, baking powder, soda, salt, and spices. Cream together shortening and sugar until light and fluffy. Add eggs, mixing well. Add flour mixture to creamed mixture alternately with milk. Fold in orange rind, vanilla extract, prunes, and nuts. Spread in greased cake pan 8x8x2 inches. Bake in moderate oven (300 degrees) about 550 minutes. Frost with fluffy icing.

PARSNIP CROQUETTES

3 parsnips, 1 tablespoon lemon juice, 2 tablespoons butter or margarine, 1 egg slightly beaten, 2 tablespoons cream, 1 teaspoon salt, 1-8 teaspoon pepper, flour, 1 egg, 2 tablespoons cold water, bread crumbs.

Wash, scarpe and cook the parsnips in boiling salted water until tender. Drain and mash. There should be one and a half cups of pulp. Place pulp in sauce pan and add lemon juice, butter or margarine, salt and pepper. Stir and cook over flame until hot. Cool and shape into croquettes. Beat the other egg with cold water and then dip croquettes in flour, then in egg and last in bread crumbs. Fry in hot fat until golden brown. Drain on unglazed paper.

THE MODERN FARMER

VOL XX. NASHVILLE, TENN., APRIL 15, 1947 No. 3

5,600 Farm Placements Of Veterans Made In January

Washington, D. C., March 24, 1947.—Farm placements of white and colored veterans of World War II, total 5,613 for January, the U. S. Department of Agriculture reports. This compares with 4,936 for the same period a year ago. The increase may be due in part to warmer weather in January of this year.

Of the total placements, 2,221 were made in the Southern States. Under the farm labor program of the Department, veterans are assisted in finding farm employment and in getting established as tenants and sharecroppers.

Also, the Farmers Home Administration and the Farm Credit Administration assist veterans to become farm owners. Other farmers, farm workers, tenants, and sharecroppers also are aided in their effort to become owners. Last year the Farmers Home Administration made farm ownership loans to 3,341 white and colored veterans and to 2,125 non-veterans.

THE BYRD NEST

By Rev. Bernard O. Byrd
—Guest Columnist.

HE SOLD OUT

Esau, in great hunger, stood pleading with his brother Jacob for food "Sell me your birth-right," was the reply. It is needless to mention to Bible readers that Esau sold out. Many will condemn Esau for selling; while on the other hand, many will condemn Jacob for buying. It is not wrong to buy, neither is it wrong to sell, if the proper wisdom is injected into the transaction. Several things were wrong, however with Esau and Jacob's transaction.

In the first place, Esau was over-anxious to sell. Men of experience will admit that over-anxious sellers or buyers are likely to make poor deals. When a prospective buyer sees that the seller is anxious to transfer goods, he gives that seller the rope that, that seller may lower the price of his commodity. Even if a man is anxious to sell, wisdom will hide anxiety from the prospective purchaser. Every worker should display some form of satisfaction for a good job, but should never allow the boss to be impressed that he is unusually anxious to keep it. The boss, taking unfair advantage of his over-anxiety may give him a reduction in salary, or an increase in chores, as a reward for that anxiety.

Esau was led to sell out because he made one failure as a hunter. A good hunter never expects to bring back a big game every time he goes on such a trip; he realizes that there are some high and low days in every adventure of life. Because Esau had a low day, he was willing to sell out the best thing he had, anybody can give up and sell out, but it takes a real man to hit the low spots, and keep on keeping on. In every branch of life men face low days, rough spots, and slippery paths, but the man who is unwilling to sell out, arms himself with a leaning staff to use in climbing out of the low places; he acquires a shock-absorbing conscience, and a non-ski determination. Such a man won't sell out.

Another reason for the failure of the ancient woodsman was, that he allowed the object of a present desire to blind him to nearby valuable possibilities. He was at home when he made the trade to sell his birth-right. Even tho he was very hungry, he should have been able to bear the pains of hunger until he could examine all immediate possibilities. His mother's kitchen was not very far away. Despite her partiality she would not have allowed Esau to die of starvation. One bowl of food blinded him to the bounties of his mother's ancient kitchen. A man is in a pitiful condition when he sees only one position to gain, one woman that he thinks is suitable to make a wife for himself, only one friend he can trust, only one possible solution for his problem or only one way in which God expects him to serve the world. Elijah made the mistake of thinking that he was the only man upon whom God could depend. God reminded him of seven thousand more of which Elijah knew nothing. When we begin to see only one way out, we should move the veil from our faces for we are blinded to the thousand of other ways God has paved to be our avenues of escape. When one thing looks like your last chance, open up your eyes; there is something else near.

The hairy son of Abraham made

REA Has Loaned Billion Dollars To Help Electrify Rural Areas

The U. S. Department of Agriculture announced last week that loans by the Rural Electrification Administration have passed the billion-dollar mark. Total allocations by the agency since it began operations in 1935 reached 1,000,068,389 on March 18, when Administrator Claude R. Wickard approved a loan of $145,000 to the Monroe County Electric Cooperation at Waterloo, Illinois.

Since the federal rural electrification program began May 11, 1935, REA has made loans to 1,011 borrowers, which include 931 cooperatives, 40 public power districts, 20 other public bodies, and 20 power companies. Of the cooperatives, 934 are organized to furnish electric service and 37 are concerned only with refrigerated locker plants.

Commenting on progress to date, Rural Electrification Administrator Claude R. Wickard said:

"Rural electrification now is only a little more than half completed, with the most difficult part of the job still ahead. Since 1935, REA borowers have energized more than 500,000 miles of power lines serving almost 1,700,00 rural consumers in 46 states, Alaska and the Virgin Islands. These rural electric system have established a pattern for rural electrification that eventually will make rural electric service available to practically all potential consumers in rural America. The REA cooperatives have prepared specific plans for doing their part of this program. Under the most favorable circumstances, this goal can be reached within the next three to five years. . ."

In addition to financing lines to unserved farms and other rural establishments, the REA program has stimulated other agencies to greater rural electrification activities. Only about 750,000 farms, or approximately 11 per cent of all farms in the Nation, received power line electricity when REA was created in 1935. REA's latest estimates showed that on July 1 last, 3,106,775 farms, or 53 percent, were connected to rural power lines.

Believe It or Not!

In preparing her Sunday dinner, Mrs. G. C. Haynes, 931 Woodmont Boulevard, killed one of her largest white Windot hens. In dressing the fowl she found that it contained 16 perfectly formed eggs, with the hard shells on.

Tribute to Soil Conservation Head

DR. HUGH H. BENNETT, Chief of Soil Conservation Service of the U. S. Department of Agriculture, responds to a tribute paid him for his soil conservation work by an old friend, Sim Bennett, farmer and minister of Anson County, N. C. The occasion was Hugh Bennett Day which was observed recently in Wadesboro, N. C. The colored farmer's tribute to the great soil conservation crusader is carried in the January issue of SOIL CONSERVATION, a USDA publication. Dr. Bennett recently announced an eight-point program designed to conserve the Nation's soil and water resources for an expanding population.

Growing Food Good Exercise

Will Myree, Prattville Community, Autauga County, proves that a year round garden in the city does pay. Last year he grew enough vegetables to sell to the lunch room of North Highland School and to some local markets.

A few years ago, Mr. Myree's health and age made him cut down on his activities as a full-time farmer. He moved to Prattville and started growing vegetables on a vacant lot. "I had to do something," said Myree. "I have been an active farmer all my life and I couldn't just leave the farm and do nothing. It is a real pleasure for me to spend my time this way. There is no such thing as a "garden season for I have vegetables all the time."

Negro 4-H Boys Enter One Thousand Dollar Forestry Contest

Washington, D. C.—Negro 4-H club boys of Mississippi are entering a $1,000 woodland improvement contest sponsored by the Gulf, Mobile and Ohio railroad, according to a report received last week by the U. S. Department of Agriculture from Mississippi State Extension Director, L. I. Jones.

"Fifty percent of our State is in woodland," says Director Jones, who adds that under good management the woodland can be made to produce greater profits. He also points out that cotton is facing

Minimum Wage Rate Increased for La. Sugarcane Workers

Washington, D. C.—The U. S. Department of Agriculture has announced minimum wage rates to be paid workers during 1947 for non-harvest sugarcane work by producers in Louisiana who apply for payments under the Sugar Act of 1937, as amended.

The basic minimun rate for adult male workers, doing ordinary unskilled labor on and after February 26, is $2.60 per day, an increase of 15 cents over the 1946 minimum rate.

Minimum rates with increases,

PAYMENT IS DISCONTINUED ON COTTON INSURANCE; LOSS CLAIMS

Secretary of Agriculture Clinton P. Anderson today announced that the Federal Crop Insurance Corporation is notifying its field offices to discontinue payment of 1946 crop cotton loss claims under the crop insurance program.

This action, which is taken at the direction of Secretary Anderson and is effective immediately, is necessary because funds available for paying claims under this part of the general crop insurance program have been exhausted. Cotton loss claims on 1946 production have run far beyond any preliminary estimate. Premiums earned for 1946 crop cotton insurance ran to about 42 million pounds, while total loss claims are estimated at three or four times this amount.

Legislative provisions under which crop insurance is operated require that insurance be made available to all cotton producers. Officials of the Department point out, however, that under the present circumstances cotton loss payments cannot be continued until additional funds are appropriated.

The action today does not affect loss payments for other insured crops (wheat, flax, corn and tobacco.) Payment of approved loss claims will be continued for these commodities. Premiums collected for this group in the insurance program are said to be adequate to meet all loss claims.

It is estimated that more than half of the total 1946 crop cotton loss claims have already been paid. Even though further payments have been discontinued, field offices of the Crop Insurance Corporation will continue to adjust, accept and process additional claims under the program.

A thorough investigation of the whole question of cotton loss

Plant Experiment Regarded as Aid to Pasture Plans

A combination of hard seed crimson clover and rescue grass, a grass developed at the Middle Tennessee Experiment Station, may be the answer to many of our pasture problems, John Ewing, superintendent of the station, told Nashville Farmers Club members Wednesday.

Both plants have a very desirable characteristic of reseeding themselves yearly, even though the ground is plowed in the meantime Ewing said. The rescue grass has been developed from one plant discovered growing on the station several years ago. Since that time a sufficient amount of seed has been produced to plant one acre. It is hoped the one-acre plot will produce enough seed to allow for a trial of the grass for pastures.

In pasture experiments last year, where grain was used to supplement the pasture, additional gains were not sufficient to pay for the grain feed. "We would not say that would be the case year after year because weather conditions favored pastures last year," Ewing declared. A very desirable profit was made on an acreage of pasture that was irrigated, he reported.

Ewing stressed the value of supplement pasture in the summer when dry weather retards permanent pastures. Last year 12 dairy cows at the experiment station were pastured on four acres of sweet sudan grass for almost 40 days with very profitable returns. He recommended the sweet sudan because it is more readily grazed by cattle.

"We have been unsuccessful as yet in the production of Lidano clover seed. Lidano, described as a giant White Dutch clover, makes very few blooms in this locality," Ewing said.

In answer to a number of questions regarding Kentucky No. 31 Fescue grass, he said there is a place for the crop in pasture programs; however, at the experiment station it has been impossible to distinguish between that grass and Alta fescue. The two growing side by side look exactly alike—and as far as we are able to determine, one is just as good as the other, he declared.

Inflammable Garments

David D. Craig, director of research for the American Retail Federation, recently testified before the House Committee on Interstate and Foreign Commerce on the problem of excessively inflammable wearing apparel and decorative plastic ornaments. This is a problem—and a serious one—which has appeared in recent years, as new types of materials have been developed. Some of these materials, Mr. Craig stated, are a real hazard to the user.

The consumer cannot tell a dangerous garment from one which is safe—so he must rely on the retailer. And this places the average retailer in an extremely difficult position. Very few stores are equipped with laboratory facilities and expert technicians able to accurately analyze goods, so they, in turn, must rely on statements of suppliers which are not always reliable.

It has therefore been urged, in many quarters, that the states pass laws forbidding the manufacture or sale of dangerous wearing apparel and setting up necessary definitions and standards. But the grave fault in this is that a state law cannot go beyond the state line. Each state would inevitably establish different criteria and provisions. Manufacturers and retailers would be faced with dozens of laws, many in conflict with each other, and endless confusion would result.

Most retailers, therefore, are of the opinion that the proper solution lies in Federal legislation—and a uniform, standard law applying to the entire country. This, in Mr. Craig's words, is "the standard American way of protecting the public from dangers which are nationwide in extent." The answer lies in Congressional action.

Farm Talk With Farm Folk

By Jesse Safley

How many calves do you have on feed? Where did you find them, and how much did they cost? These are familiar questions among county agents and vocational agricultural instructors in Middle Tennessee and throughout the state.

Desirable calves for feeding are scarce this spring and boys who are making purchases are having to pay a high price for them—even after intense searching in Tennessee and other states., This year, as in years past, carloads of steers have been imported from the Western states for 4-H and FFA club members to feed.

For a number of years we have questioned this method of teaching beef production to the boys who will man the farms in the future. Our thinking does not agree with that of others who have had much more experience in the program, and we have no hope of causing them to see the siutation as we do. However we do hope some of those personally involved in the program will think seriously with us regarding the matter.

The ultimate goal of the University of Tennessee, through the agencies sponsoring the junior farm program, is to teach the boys to be better farmers. Can this be brought about through methods that are not practical for established farmers? The present junior beef cattle program is not practical and we offer as proof the fact that no farmers send to the market beef that was produced by the method recommended for the junior group, and records of the University of Tennessee experiment stations which prove the only way for a farmer to show a profit from beef is through pasture feeding.

We don't say that boys in the past years have failed to show a profit for their labor and money invested. However, there are numerous incidents which we question. They have been able to show a profit only because the buyers year after year have paid premium prices for the fat animals in efforts to encourage the work. This is a very noble gesture and one appreciated by all—but just how much does it contribute to a long-time beef program? The same boys after they pass club age can no longer afford to follow the methods they have learned in producing choice animals because the buyers do not subsidize adult farmers.

The Junior Beef Club program in Tennessee has developed more or less into one of the "Smiths keeping up with the Joneses." It is the desire of a number of counties to produce the grand champion and to have the largest number of finished animals in the annual show and sale. To accomplish this it is necessary for those feeding the animals to keep them in the stall and use dry feed altogether, occasionally supplemented with milk. Before that, however, it is necessary for some one to spend considerable time locating the animals to feed. The animals are often purchased at prices far in excess to what a man who is farming for a living can afford to pay. Remember the aim of the program is to teach the boys how to be better farmers.

Until time for the show and sale, the animal is kept on full feed of concentrates, much of which is purchased in bags from feed dealers. The period of feeding is four, eight, or 12 months and often longer. Few calves will grade choice under eight to 10 months of concentrated feeding. The animal is sold and the club member is out of the beef business again. What has been accomplished?

There are other counties which do not have the individuals willing to gamble by purchasing a high-priced calf, hoping that it might finish out choice grade. For that reason the beef club members attempt to pasture their home produced animals on insufficient pasture with a little amount of feed. The result: the animal makes a very poor showing in competition with the finished animals. People look with suspicion at the calf, the boy and the agent or teacher under whose supervision the work was carried on. The boy becomes discouraged even though he might have cleared a nice profit. The next year, unwilling to feed another home-grown calf, the money made on the first one is invested in a steer with more breeding. What has been accomplished in that case?

We believe strongly in a statement we heard recently from a farmer county agent. He said, "The man who makes money on a calf is the man who sells it the first time." If that is true, very few junior feeders make money because the percentage of the calves sold which are bred on the farm is very small.

It occurs to us that the whole program is being approached in the wrong manner, at least in a number of counties which in turn have forced other counties to follow because of the competition that has developed.

The program as it exists today involves the outlay of a certain amount of cash each year on the part of most club members and considerable time on the part of the U-T representatives in locating animals. Wouldn't it be better for the supervisor to encourage the boy to spend the amount of money necessary to develop a few acres of desirable pasture? After the pasture is established assist the boy to locate a pure bred female animal, but by no means assist the club member unless he has the pasture. There is the argument that many boys have no place for a pasture. Records of our experiment stations have shown: if you have no pasture you cannot stay in the beef production business long.

A program of the kind will take time. Under the present program no one has time to wait, for fear they will make a poor showing in the competition. A pasture program should be first in any junior beef cattle club—but presently that phase is being sadly neglected.

Maybe it would lessen the number of beef club members at the present but since the program basically is a long-time one, the number would eventually increase because the pasture way in beef production has been proved economically sound.

The Trend in Retailing

A number of retailers' associations have recently held their annual conventions. Experts in various phases of merchandising have thoroughly discussed consumer preferences, dealing with manufacturers, the price situation and other problems involved in the complicated business of turning raw materials into goods on store shelves. And the general tenor of feeling is that the consumer will be offered more and better goods—and that further price advances must be opposed.

Pricing of goods, as one resolution observed, is the joint responsibility of manufacturer and retailer—with the consumer making the ultimate decision on whether the price is right. It does no one any good to produce commodities which people won't buy because they think they're overpriced. And retailers are working to see that goods in that category disappear from the channels of trade.

The effort of retail business to improve quality is an important, and often overlooked service to the consumer. It is bearing fruit now. The shoddy merchandise which was unavoidable during the war years is going rapidly into limbo. Retail buyers are insisting that manufacturers provide the best possible article for the money—and they are refusing to buy when they think that isn't being done.

Retailers are also stressing greater efficiency and courtesy on the part of employes. The curt, disinterested clerk of the war years, who couldn't be fired because there was no one to take his place, is disappearing.

The chain system must be given much of the credit for the work in the consumer's interest which is being aggressively pushed now. Independents are cooperating fully. The public reaps the rewards.

Dr. Darby Asks More Facts on Growing Food

Reviewing two recent reports on the relationship of nutrition to soils and agriculture, Dr. William J. Darby of Vanderbilt University School of Medicine, in the lead article of the current issue Nutrition Reviews, makes a plea for more reliable facts concerning the growing food.

Dr. Darby cites a report by Sir Cedric Stanton Hicks in which he points out that " if one divides the actual arable acres per person available in a given country by 2.5 acres, one may derive what may be termed a population saturation coefficient" and "in a total of 27 countries only six countries (Canada, Argentine, New Zealand, Russia, the United States and Australia) have a population coefficient greater than 1.0."

Hicks suggests continuous cutting of fodder crops, water culture and introduction of new strains with shorter crop cycles has possibiilties for increasing the flow of nutrient materials from the soil.

Another report by F. A. Pearson and F. A. Harper which Dr. Darby cites points out that in only a small portion of the earth do all seven of the factors, such temperature and rainfall, exist that make the land arable. They suggest expansion of the present crop area by better conservation of animal manures, expansion of commercial fertilizers, use of more machinery, more efficient livestock, new and improved varieties of crop, control of animal and plant diseases, and more double-cropping.

Dr. Darby points out, however, that in the two reports, Hicks estimates the world's arable land at 40 per cent of the global surface while Pearson and Harper set it at a 7 per cent.

On the other hand, Dr. Darby comments, both studies reach the same conclusion: "So long as our food supply depends upon the type of agriculture in existence at this time, the number of people which the world's food supply will support will depend upon the standard of living of those people. Whether the science of nutrition can ultimately provide means of supporting an expanded world population at a very high nutritional plane through developments of new methods of food production, such as the production of food yeasts and of synthetic foodstuffs, remains for the future to decide."

More Coal for Less Cost

The coal industry in the United States has not lagged in technical development designed to increase output and reduce costs. Very great progress has been made, for example, in cutting and handling coal mechanically. And this, incidentally, has been accompanied by a steady advancement in mine safety, and substantial reduction in the accident rate.

The coal industry, in company with other interested parties, is now engaged in research which may prove to be of a revolutionary nature. Underground gasification of coal is attracting wide attention, and experiments are being carried on in an Alabama mine with similar experimentation anticipated elsewhere. Most mechanical difficulties have been eliminated, and success may be in sight. If that happens, it will make possible the utilization of impure coal and coal seams which are too thin to mine under present methods. It would also result in a more complete recovery of coal, inasmuch as 35 to 50 per cent of coal remains underground now.

The coal industry is seeking to make maximum use of this natural resource—and, at the same time, to reduce costs in the interest of maintaining a favorable competitive position with other fuels. The last is an extremely serious problem at this time—high labor and other costs have produced a real danger that coal may lose some of its markets. So the industry, in the manner which is typical of free, competitive enterprise in the American economic system, is turning to science, research and further mechanization as one of the solutions.

The Campaign Against Fire

On May sixth to eighth, a conference will be held in Washington, D. C., which will be of direct and personal importance to every person in the country. It will be a national conference on fire prevention—and it has been called by President Truman to meet a grave emergency.

In attendance, there will be officials of the Federal government, the states, and municipalities, and representatives of business, the professions, and civic and service organizations of many kinds. It is hoped that the largest possible representation of interested parties will appear and that officials from every state will attend.

The conference will have several purposes. It will, first, create a wider recognition of the need for more adequate standards of building construction, and the firm and impartial enforcement of building codes and fire safety ordinances. Of equal importance, it is hoped that it will develop a vitally-needed sense of the personal responsibility that must be shared by every citizen if our terrible fire toll is to be reduced.

Loss of life and destruction of property by fire must come down. That is the basic theme of the coming conference. Its work will be in the interest of us all.

Why Fire Loss Is Rising

The Natioal Board of Fire Underwriters recently analyzed the causes of the disgraceful and menacing increase in fire loss in the United States—a loss that came near the $600,000,000 figure last year. The following principal reasons were cited:

1. The increased value of property, merchandise and large inventories.

2. The use of substandard housing.

3. Overcrowding of buildings, with a resulting strain on electrical circuits and heating plants already in disrepair because of wartime shortages.

4. A tendency to build factories and other high-value properties in outlying areas where water supply for fire fighting purposes may be inadequate.

5. Shortage of fire department equipment.

6. A great increase in carelessness at the end of the war.

Most of these causes of fire are correctible. Substandard housing must be prevented by local building and safety ordinance. Communities will soon be able to obtain needed fire equipment. Adequate repair and maintenance of electrical and heating facilities can be obtained now. The last cause, human carelessness, is probably the most important—and it is likewise the most indefensible. So long as we take chances with this great destroyer, lives and property will continue to be needlessly sacrificed. That is the message which must be brought home to all the American people.

A Better Buy

A news story in the Wall Street Journal tells of a large retail organization which employs 300 men to operate a "torture chamber" where merchandise is tested to find out "if it is as good as manufacturers crack it up to be."

According to the account, "The snap in a pair of 25 cent garters, the warmth of a winter overcoat, and the life span of a $400 hay drier all come under the watchful eyes of these critical experts, whose occupational disease is pessimism."

The purpose, of course, is to see that customers get a better buy for their money. And the effects of this are felt in stores, down to very small ones, which have no research organizations of their own. Standards are established—faults are discovered and virtues proved—and quality goes up all along the line.

Chain stores have been leaders in the testing of merchandise in all fields. Retailers generally are thinking in terms of better quality, better service and maximum return to the buyer for his dollar.

That is typical of America's magnificent distribution machine.

Make the Farms Hum

By Grace Armstrong Allen

It was hard to believe in Spring when one awoke on St. Patricks's Day in the mornin' and saw snow falling. Down it came on yellow daffodils that were justifying Shakespeare's immortal assertion that they "come before the swallow dares and take the winds of March with beauty." The snow hurt neither daffodils or honeybees, but the stubborn cold keeps buds locked up. Red maples, winged elms, willows—all have been laggard this year. These welcome first blooms bring more pollen than nectar, and this pollen is very important for early brood-rearing.

Pollen, indeed, is vital for both bees and plants, being food for the one and the fertilizing agent of the other. Even above their production of honey, the principal benefit of honeybees—the most important for mankind—is pollination. To produce fruits, grains, vegetables, not only is cultivation necessary, including correct procedure in planting, fertilizing, etc., but insects must be considered, too. There must be protection against the injurious ones. And for many species of plants, there must be beneficial insects to carry pollen from one blossom to another.

Of all pollenizing insects, honeybees are by far the most important. There are several reasons. They are the only ones we can easily control—that is, have them or not have them. Stiff hairs on their bodies and legs catch and hold pollen grains which rub off in the next flower, where still more are picked up. And they work only one kind of flower at a time. If a honeybee works an apple blossom, apple blossoms are the only flowers visited on that trip. She does not go from apple to wild mustard to white clover. If she starts on white clover, she sticks to that. Think what this means in the affair of pollination. Moreover, in the long fight against injurious insects, many beneficial pollenizing groups—such as other bees, certain beetles and flies—have been almost eradicated. So there isn't enough of them left.

Many a farmer beekeeper has not realized t h i s. While he thought honey was all he was getting from his bees, they have been pollinating his orchard or grains. Or perhaps some neighbor's bees were working for him. free.

In some sections, however, poisonous sprays have killed off honeybees, too, to such an extent that beekeeping has been given up. Most farmers know from their own experience or from farm journals, that the per-acre production of legume seed has declined so seriously that the Department of Agriculture has been asked to find out why. There are probably several whys. One is the lack of insect pollination.

Commercial orchardists, especially apple-growers, are very dependent on honeybees. Many varieties of fruits and berries are known to be self sterile, and so completely dependent on cross pollination. And experience has shown that even the varieties considered self-fertile are benefitted by pollenizing insects. Many orchardists have become successful beekeepers, with honey an additional crop. Others arrange with beekeepers to place hives throughout the orchard.

Alfalfa needs insects for seed. So do sweet clover and Ladino white; alsike and crimson, visited by bees, yield increased crops of seed. Cross pollination is necessary for some varieties of vetch, notably hairy vetch, and they all set more seed with bees.

In their natural life, plants and insects live in a balance beneficial to both. But man, in extensive agricultural regions, has multiplied plant life a thousand fold while decreasing the number of wild insects That has upset the balance and also the apple cart. Honeybees on farms are the answer.

The only reason many farmers fail to make a profit on sheep is they have no sheep on their farm. Statistics show that sheep production in Tennessee is declining annually.

75,000 Tennessee Farmers File 1947 Plans With ACA

More than 75,000 farmers in Tennesse have filed their 1947 farm plan with ACA officials, indicating they will participate in this year's farm program, state officials of the ACA program said today.

Although conditions will not permit representatives of the local offices to call on each farmer as has been the custom in the past, state officials believe the number of farm plans which will be filed will equal or even exceed the number in the past.

It was pointed out that farmers know where their local ACA office is located and that it is a very easy matter for them to stop by the office and file papers without making a special trip.

No closing date has been set for accepting farm plans but most counties plan to complete the job by early May.

It is expected that a larger percentage of the more than 200,000 Tennessee farmers will file a farm plan which will be used as a basis for alloting various agricultural materials and making soil conservation payments.

Farmers who have not filed their plan of work are urged to do so at their earliest convenience.

Spring Clean-Up Drive Urged to Curb Fire Losses

Fire losses in the United States continue to grow while the nation is confronted with the greatest housing shortage in history. This fact, said G. B. Shivery of the U-T Agricultural Extension Service, should be sufficient reason for each community's holding a Spring Clean-Up Campaign.

But, Shivery said, many farm people, as well as others, learn the hard way. That is, they allow fire hazards to lurk around the farm until one wipes out hundreds of dollars' worth of property, and possibly one or more lives. The February loss of $64,000,000 exdeeds any month on record, and is a 24 per cent increase over the fire loss of the same month last year.

Clean up today and you won't burn up tomorrow is the slogan of the Spring Clean-Up campaign. Poor housekeeping on the farm means rubbish and unused articles in barns, attics, outbuildings, and other places. Discarded oily rags, frayed electric cords, or even cobwebs and dust are fire hazards. Soot-caked chimneys and flues are a menace, especially where combustible roofing material is used. A light, strong ladder in a convenient place is a fire protection measure within the reach of any farm family, Shivery points out.

Farm families in every community are urged to set a clean-up date when it will be most effective this spring, and to make their farms safe and healthly by making them clean.

North Alabama Counties to Plant 400,000 Trees

Four counties in Alabama, near the Tennessee state line have made application for 400,000 trees for planting during the next year, it was announced today.

In Jackson, Marshall, DeKalb and Madison Counties during last year a total of 205,000 seedlings were planted, J. A. Rodgers, district forester for the counties, declared.

The plantings, pine and black locust, are being set in an effort to increase the excellent grade trees for wooded areas and lumber in the state, it was said.

Madison County plans to plant 225,000 pines and 35,000 black locusts, while Marshall Countians have made application for 40,000 pines and 10,000 locusts. In Jackson County the residents plan to set 90,000 pine trees and 10,000 lucusts, the reports of the forest office reveal. The list of DeKalb County has not been completed, however, it is anticipated that they will not fall short of the high average set by the other three counties in Alabama.

Fight Tobacco Plant Diseases, Expert Urges

While tobacco plant beds have been only burned and seeded to date—it is possible to look ahead and visualize what may happen to the plants before setting time.

Readers of the Banner Farm Page have been informed that blue mold has appeared in the tobacco beds in southern Georgia, and, in spite of low temperatures, has spread and become more destructive daily. In the past, so it has been my observation, as has gone blue mold in Georgia, so it has gone in Tennessee—but with somewhat less severity. Blue mold is on its way to Tennessee, and if I were on a farm and a tobacco grower, I would prepare to put up a fight. I would nip this disease in the incubation state.

Recently, I visited the farm of Joe Bowman, located near Franklin. Joe is one of Williamson County's leading young farmers. My purpose in making the visit was to encourage him to be prepared for an attack of blue mold on his tobacco beds.

With a broad grin on his face, Joe said, "Mr. Milton, I am ready." I looked out in front of his house in a Kentucky 31 fescue grass field and discovered four tobacco beds, 200 feet long, ready for the canvas.

"My beds were sterilized last fall with cyanide and just before the recent snows I seeded them to Kentucky 16, 19, and 56 seed. The 56 is resistant to mosaic, the disease that caused so much damage last year," Joe said. He had also gone to the trouble to remove the roots of all poke plants around the fence. "I'm taking no chances," he declared.

We discussed the methods he planned to employ in fighting tobacco diseases. Last year he used both methods—spraying and dusting—and he plans to follow the same practice this year, although he favors dusting. He has purchased an ample supply of Fermate and talc to do the job. The talc is used because it lessens the cost, and the possibility of burning the plant with Fermate is not so great.

Joe mixes 42.5 pounds of talc with 7.5 pounds of Fermate, set the dust gun at 10 pounds per acre and walks around the bed as he applies the dust. Extra pieces of pipe are used to reach the center of the bed.

I believe Joe is one tobacco producer in the state who will successfully combat tobacco plant diseases this year.

Many other farmers could profitably follow his examples of being ready.

Sweet Potatoes and Sugar Cane Give Farmer More Cash Income

After talking with his country agent last winter about making more cash income on the farm, Bennie Easley of Myrtlewood Community, Marengo County, Alamaba, decided to do a little truck farming along with his other crops.

In February he bedded out 18 bushels of sweet potatoes. He carefully prepared one acre of land, and used 500 pounds of 4-10-17 fertilizer as recommended by the Alabama experiment stations. There were enough potato slips on the bed to set his acreage at the first setting. Then he sold $65 worth of slips to local markets and farmers.

By setting his potatoes out early and doing a good job of fertilizing and cultivating, he had potatoes ready for early market. This one acre produced 220 bushels of potatoes. He sold 145 bushels at an average of $2.50 per bushel or a total of $262.50. He saved 75 bushels for home use.

Mr. Easley also prepared and fertilized one acre of land which he planted in ribbon cane. From this one acre of cane he produced 300 gallons of syrup. He sold 150 gallons for $225. Easley is keeping 150 gallons for home use and for sale next summer when prices go up.

Railroad Rates—and Railroad Progress

This country cannot operate without adequate railroad transportation—and the only way to assure such transportation is through continued investment in better rail facilities. The only way to insure that needed investment is to permit the railroads to earn not less than 6 per cent on the value of their properties. And six per cent is approximately double what the industry is expected to earn this year.

That is the substance of an exhaustive report on railroad finance made by the Bureau of Railway Economics for a research group of the Association of American Railroads.

The detailed report produces some important and little known facts. It shows that since 1921 the railroads have spent more than $13,000,000,000 on improvements—and that for every dollar paid out in dividends during these years, two dollars have gone back into the properties. At the same time, the railroads have greatly reduced their outstanding indebtedness in the hands of the public. Since 1932, for example, this indebtedness has shrunk by $3,000,000,000.

During the past 25 years, the rate of return on investment has averaged only 3 1-4 per cent—and that period includes both the business boom of the '20s and the war years during which railroad earnings reached a peak. Last year, though the lines carried the heaviest peacetime traffic in history, earnings were only 2 3-4 per cent. The recently granted rate increases, valuable as they are, will permit the lines to earn a return of only 3 per cent for 1947.

The Supreme Court, in several cases, has held that earnings of as much as 6 1-2 per cent on the rate base of a public utility are fair and reasonable. And it is clear, from this report that future railroad progress which is vital to the future progress of all business, depends upon rates which will permit the lines to earn at least 6 per cent —and thus put them on a basis of equality with other regulated public utilities.

The whole case was summed up by R. V. Fletcher, president of the Association of American Railroads, who, after quoting from the report, said: "All in all, no better investment can be made in the future of agriculture, industry and commerce in the United States, than rail earnings which make possible continued investment in more adequate and more efficient railroads."

Better Day for Sharecroppers Who Survive Cotton Machines

"Although the use of machines may make serious human problems for millions of southern farm families, in many ways it will help them," H. H. Williamson, assistant extension director of USDA, declared in addressing the Negro Extension Leaders' Workshop held recently at Southern University.

"If it means an end of fatback, fifty cents a day for cotton chopping, seventy-five cents a hundred for picking, and the general low level of living in the rural South, then I am for machines," he added.

At the workshop, Mr. Williamson spoke on the subject "The Status of the Proposed Adjustment Program for the Cotton South." He reviewed the history of the farming pattern of the South and discussed future trends and developments. He felt uneasy about the human problems which machines may make in reducing the cost of cotton production. Yet he says that machinery must be used if cotton is to compete with synthetic fibers and paper.

Mr. Williamson described a plantation in Mississippi where cotton machines are widely used. He said that two-thirds of the sharecroppers and day laborers on this farm had been replaced by tractors, flame cultivators and mechanical cotton pickers.

Yet the laborers who are left live in better homes with electric lights and running water. They are guaranteed $20 per month, free rent, electricity, water and a garden plot the year-round. For their work they are paid at the rate of 40c an hour. On an average, these workers now earn more than $11,000 per year.

When you find that you have too much salt in your soup stock, the flavor may be improved by dropping a few slices of raw potato in the soup. The potato will absorb some of the excess salt. Of course the potato should be removed before the soup is served.

Though it's a long time until spring planting, many Alabama farmers are already getting the fertilizers they will need, API extension agronomists strongly urge that all farmers see their fertilizer dealers about this years needs as soon as possible.

New Methods Urged to Offset Garden Delays

Delay in starting gardens this year should not discourage those who like fresh cabbage and tomatoes, but new methods will be needed to insure good production, according to garden specialists at the University of Tennessee.

Experienced gardners set cabbage plants in February, or early as possible. Later setting does not give as high production but is still worth while, it is emphasized, if desirable frost proof plants are available. When these plants are of inferior quality, showing that they have been held too long in storage, it is just as well to plant cabbage seed at the first opportunity. Early varieties like Jersey Wakefield and Golden Acre have a fair chance of making good heads before the weather becomes too warm.

Planters who have seen their cabbage plants wilt and die in hot weather, showing that the yellows disease is present in the garden soil, should try to get seed of yellow-resistant cabbage varieties, specialists say. One of these, Wisconsin All Seasons, is old extensively in the State. It is not an early kind, but if good insect control is practiced it will make good heads in summer.

Disease troubles in the tomato crop also suggests home raising of plants this year. Seeds of Marglobe or Rutgers, planted indoors or under glass or cloth, in heat-sterilized soil, will provide healthy plants.

Somewhat earlier yield may be expected if the plants are set out before frost is over and are covered with cloth or commercial paper hill covers. It is also a good plan to plant seed in the garden directly under such covers in early April.

Sheep Shearing Demonstrations Slated in State

Three sheep shearing demonstrations teaching the Australian method will be held in Middle Tennesse this spring. Paul P. Hite, sheep specialist of the U-T extension service, announced today. Demonstrations are scheduled in Columbia, April 30, Cookeville May 1 and Lebanon May 2.

E. A. Warner, livestock specialist, Sunbean corporation, Chicago, will demonstrate the methods of shearing and caring for the fleece after clipping.

Tennessee sheep producers lose several thousand dollars annually through improper management Hite said, "Proper shearing and preparation of the fleece for market is of key importance in determining the market value of the clip," the sheep specialist said.

In addition to teaching the correct method of shearing, Warner will also review care and sharpening of shearing equipment.

Pork Sausage

One part fat to three or four parts lean makes sausage of best quality which will fry itself and not be too dry. Add five teaspoons salt, four teaspoons sage and two teaspoons black pepper for each four pounds of mixed meat. To get the seasoning through the meat, sprinkle it evenly over the meat before it is ground. Grind meat coarsely the first time and as finely as desired the second time. Double grinding thoroughly mixes fat, lean and seasoning.

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.

Giles A. Hubert _____Editor
Sadie Wilson _____ Secretary
Henry Allen Boyd_____ Publisher
Office, 403 Charlotte Avenue.

Devoted to the interests of the Farmer, Truck Gardner, Livestock and Poultry, Breeder, the Home and the People.

Entered as Second Class Matter, April 10, 1929. at the Post Office at Nashville, Tenn., under act of 3, 1879.

All contributions for publication in the Modern Farmer, should be addressed to The Modern Farmer, 403 Charlotte Avenue, Nashville 3, Tenn.

No libelous matter will be published. Unsigned articles or letters, and those written on both sides of the paper will not be used.

Subscription price $1.00 per year, 75c for six months, payable in advance. Personal checks must be certified. Make all checks or money orders payable to The Modern Farmer.

Advertising rates and sworn circulation figures presented upon application.

Payment Is Discontinued

(Continued From Page 1)

claims, particularly in the areas of heaviest reported losses, will be undertaken at once under the immediate direction of Secretary Anderson. Although it is recognized that 1946 cotton production was below normal, the investigation will cover reasons for the very high number of loss claims in some areas, and the amount of losses claimed.

Secretary Anderson has today asked Ralph S. Trigg, Deputy Administrator of the Production and Marketing Administration, to organize a special investigational group and to assume personal supervision of this group in the field during the immediate investigation of all angles of the cotton insurance situation.

Negro 4-H Boys Enter

(Continued From Page 1)

stiff competition from synthetics such as rayon.

"Since some synthetics are made from wood," declares Director Jones, "our extension program is designed to help farmers produce wood in line with the needs of the synthetic industry."

The woodland improvement contest is open to all 4-H club members—Children of sharecroppers and tenant families as well as of owner families. Of course, the clubbers must have a working agreement with the owner of the acre of woodland they attempt to improve, says the director.

Forty-eight prizes are being offered to the winners. Eight of the prizes include four-day trips to Tuskegee in addition to cash awards.

Officials of the Department's Forest Service are emphasizing the need for woodland improvement and reforestation. They point out that 75 million acres of denuded and poorly stock forest land needs to be planted to trees. During the last 20 years, only 6,438,632 acres of forest land have been planted. At this rate it will require 600 years to complete the job, say Forest Service experts.

Minimum Wage Rate

(Continued From Page 1)

for other classes of work and for other workers are as follows: adult female workers, $2.15 per day (10c daily increase); tractor drivers, $3.25 per day (15c daily increase); teamsters, $2.60 per day (15c daily increase); and workers between 14 and 16 years $1.95 per day (10c daily increase). The increased rates are designed to provide labor with their customary share of the higher price expected for the 1947 crop of cane.

The Sugar Act requires, among other conditions of payment to growers, that all persons employed on a farm in the production, cultivation, or harvesting of sugarcan be paid in full at rates not less than those specified by the Secretary. Minimum harvest rates will be determined prior to the harvest season.

The Byrd Nest

(Continued from page 1)

the mistake of lingering around the bowl of food Jacob had prepared for himself. The more he lingered, the better the food smelled. The more he smelled the food, the more his appetite was sharpened for that food. He would have abated his appetite and saved his birth-right if he had walked away.

As the thermometer of his appetite went up, the thermometer of endurance went down. Esau the red man asked, "What good is it to me if I die?" It is unwise to hang around things which have natural tendencies to intensify your desires for them, that is, if the acquisition of those things cause you to give up something more valuable. When injurious or unwholesome things have been the objects of men's affections, too much hanging around, has caused too much falling down. Eve hung around the fruit-tree and fell. Achan hung around riches and died. Samson hung around Delilah and lost, strength, sight, and later his life. You should be sure you are not hanging around, and setting your affections on things which may cause you to lose your natural and divine birth-rights. Esau did not try to overcome his own weakness, or to resist a mighty temptation, or to conquer a problem of lust; he smelled the food, sent his resistance into a slump, gave his wisdom a black-out, set his affectations on things which last only for a season and sold out.

Crops and Livestock Pay Sumter Farmer

"Tom Bevill, leader in Zion Hill Community, is one of the most successful farmers in Sumter County," says County Agent A. C. Parker.

Beville planted winter peas and vetch on land where he planted row crops. He has two acres of lespedeza sericea. After cutting the crop two times and grazing it three weeks he still was able to harvest 500 pounds of sericea seed. This farmer has a permanent pasture seeded to white Dutch clover and Dallis grass.

"For many years I have followed the extension teachings and have seen the need for livestock and pastures along with row crops in my small farm business. My income last year was from beef cattle, hogs, cotton and goats," Beville says.

He has a herd of 42 cattle including a purebred bull, 12 high grade heifers and 30 grade cows. Calves are sold each year from the grade cows.

"Last year was the first time in eighteen years that I have missed a crop of cotton," says Mr. Beville. "I just got my livestock worked into my farming program in time to save me from a complete crop failure in 1946."

Methods Cited to Rid Milk of Onion Flavor

Pasture management to a large degree will reduce the amount of onion flavored milk produced during the spring, C. E. Wylie and Sam Hinton of the U-T dairy department revealed in a recent publication.

Mowing the pasture after the soil has become warm, removing the animals from the pasture a few hours before milking time, and grazing dry cows and heifers on pasture that is infested with onions, are the three methods suggested in the publication.

The dairy specialists said experiments on U-T farm pastures had proven that low temperatures favor the growth of onions. By clipping a plot containing onion plants and keeping it clipped, one can determine when growth stops. Then is the time to clip the entire pasture and no more onion flavored milk will be produced from that pasture until the soil becomes cool again in the fall, they declared.

When a pasture is only slightly infested it will help to remove the animals a few hours before milking time; however, if the infestation is severe this will not reduce the amount of onion flavor in the milk.

The best method to prevent the off flavor milk is to pasture the dry cows and young heifers on the infested areas while the onions are still growing, and also provide pasture that is free of the onion for the milk producing animals.

There will be cases when it cannot be done, but more dairymen than do could follow the practice, they declared.

"Onions might be eradicated by plowing under twice a year for two successive years, however, there are times, when this will not be practical," Wylie said.

The publication reveals that on the basis of present information the addition of materials to overcome the objectionable flavor cannot be advised.

Nutritionist Urges Food Production for Proper Diet

Lawrenceburg, Tenn., March 24. —(Special)—Every farm family could and should produce a sufficient amount of food to allow for an adequate family diet, Miss Frances Shoun, nutritionist with the Tennessee Department of Public Health, told members of seven veterans farm training classes here recently.

The nutritionist said it could be accomplished through a year-round garden with a variety of vegetables and a small orchard, including both fruit and berries, with milch cows, hogs, and poultry in sufficient number to supply the family with milk, meat and eggs.

She recommended that the group of 140 veterans, who are in most cases operators of the farms on which they live, make a study of the seven basic foods recognized by nutritionists as the essential foods in the human diet and provide those foods for their families. "Too many farm families fail to recognize the value of milk in their daily diet," Miss Shoun said.

The value of good soil in a nutrition program was stressed by instructors of the various classes, who are attempting to broaden their program beyond the scope of planting and harvesting.

Instructors include Jimmy Held, Neal Beard, R. O. Armstrong, Quentin A. Chandler, James E. Norton, Frank Hulen, John L. Kilgo and Joseph T. Baxter.

To remove onion odor from the hands, rub them with dry salt or dry mustard.

Sweet Potato Seed Selection Is Important

It's almost bed-time for sweet potatoes, but only good, disease-free potatoes should be bedded, since much of the season's success depends upon the potatoes from which plants are produced.

Furthermore, chances are that the best available is right here in Tennessee. This is the advice of Arthur Meyer, associate professor of horticulture, U-T College of Agriculture.

Farmers who grow sweet potato plants for their own use or for sale should guard against bedding diseased potatoes, Meyer pointed out, urging special care against internal cork. The outside of the potato probably will not show signs of the recently discovered internal cork. Only by cutting the root can the disease be detected. It is characterized by dark brown to black hollow spaces in the flesh of the potato, and the disease is accompanied by a very bitter taste. It is considered to be a virus disease, the carrier of which has not been determined. While the disease is somewhat widespread in some southern states, it is known to be present in only two places in Tennessee. No one, Meyer said, should hope to avoid internal cork by importing plants or bedding potatoes from some other area.

Regardless of the variety selected for bedding, the potatoes should have certain characteristics. They should be free from stem rot and black rot, with which growers are familiar, and free from "minor" diseases. Well-shaped potatoes one and one-half inches or more in diameter should be used. Roots showing shriveled or decayed ends should be discarded.

Interesting facts About the Railroads

The amount of unexpended authorizations for freight and passenger cars, locomotives and other equipment carried over into 1947 by the Class I railroads amounted to $451,894,000, the greatest amount of carryover for any corresponding period in the past twenty-three years.

Cost to the railroads of owning and maintaining tracks and crossing protection took 22.7 cents of each dollar of railroad revenue in 1945.

In the nearly six years extending from seven months before Pearl Harbor to sixteen months after V-J Day that furlough fares, allowing a special rate of 1 1-4 cents a mile, were in effect, it is estimated that railroads saved men and women in the armed services approximately $440,000,000.

More than 4,000 men and women car cleaners are required to service Pullman cars in 232 railroad yards throughout the United States. Canada and Mexico.

Class I railroads in 1946 had a net income of only $288,534,000 after interest and fixed charges, compared with $450,433,645 in 1945. The rate of return earned on net property investment, compared before interest and fixed charges, was 2.79 per cent in 1946 compared with 3.84 per cent in 1945.

Thirty-six Class I railroads in 1946 failed to earn interest and rentals, compared with twenty-six in the preceding year.

There is now in use a specially designed aluminum child's chair which weighs 52 ounces and fits securely on a regular chair in railway dining cars but which can be removed and stored in a small space when not in service.

Meeting all Comers

Some time ago, in a discussion of the world oil outlook, J. Howard Pew, president of the Sun Oil Company, said this: "American oil asks no special privileges, at home or abroad.____We ask only the opportunity to do business in the traditional American manner of competing with all comers, with none barred, on a basis of equal rights. without coercion or monopolistic restraint of trade."

The remarkable achievements of the oil industry in the past have resulted from that manner of doing business. For a great many years, for example, it has been periodically stated that the nation is in danger of running out of oil. Yet, despite the enormous demand on oil resources made by the war, our proved reserve of crude are the largest in American history, and they are constantly being increased by new discoveries. Of equal importance, new technological development promise to multiply these resources and their utilization by more than two-fold in the near future. Free enterprise—not government cartels or international monopolies—have been responsible for that.

The world's need for oil is greater than it ever was before. The increased use of diesel power is alone causing something of a revolution. New and unexpected uses for oil in one or another of its thousand forms are constantly appearing. And the American oil industry, with a proud record of service behind it, has no fear that it will in any way fail to meet the needs of those who depend on it.

Transportation Policy for the Future

This country should begin the development of a long-range transportation policy which is adapted to the present and future needs of shippers and travelers,—and which will permit maximum service by our magnificent transportation machine.

First, this policy must enable all carriers to earn an adequate return on money invested in them. so they may make the enormous purchases of new and improved equipment essential to giving shippers and travelers the best possible service. The railroads, for example, despite the recent rate increases allowed by the Interstate Commerce Commission, will this year earn a return of around 3 per cent. That is obviously not enough.

This policy must cover the growing problem of airport and air terminal construction. Present facilities have grown obsolete as more and larger commercial planes take to the skies, and communities are confronted with the problem of expansions of airports. Means must be found to fairly share these costs between taxpayers and commercial user.

The policy must consider the highway question. Our roads, like our airports, are not now adequate for truck and bus traffic. Are the highway carriers paying their proper share of the bill? Whatever the truth, the taxpayers should know it.

Finally, any transportation policy which is to serve our needs must make possible coordination between every form of transport—by rail, highway, air and water. Our old regulatory philosophy held that each kind of carrier should be strictly confined to its basic field. That philosophy has been changing, but too slowly to keep in step with the demands of the present. We can't get full value from the transportation network on which American commerce and military security depend until all the carriers can provide the most extensive possible service, under suitable public regulation.

Looey: Now I want one of you fellows to explain to me why it's important not to lose your head at any time. Blooey: Well, you'd have no place to put your helmet.

Corn and Hogs Are Good 4-H Projects

Corn and hogs are as closely related in farm production as ham and eggs are as foods for the table. This is the reason that E. C. and M. L. Brown, brothers and 4-H Club members of Ward Community in Sumter County, started growing corn and hogs for their projects last spring.

They rented two acres of land from their father and bought two Spotted Poland china gilts. They now have 16 pigs and enough corn to feed them out for market.

The Brown brothers planted corn following a good growth of vetch. They fertilized it with 300 pounds of 6-8-4 fertilizer. Thirty or 40 days after planting they side dressed it with 100 pounds of nitrate of soda per acre. The boys followed practices recommended by County Agent A. C. Parker in cultivating the corn. They harvested 96 bushels of corn from the two acres.

These clubsters have refused to sell the pigs at $5 each because they are planning to market their corn through them.

Alabama farmers who produce cattle and hogs economically can expect a good profit next year because demand for meat early in 1947 will continue strong.

Plan Sweet Potato Crop Now, Specialist Says

"If you desire a good yield of high quality sweet potatoes at the end of the season—now is the time to make plans for them," Arthur Meyer of the U-T College of Agriculture said today. The sweet potato is susceptible to diseases and insects which might be controlled he said.

Emphasizing production and quality, the horticulturist said many farmers have "two strikes" on them before the plants are set in the field. When removed from the bed the plants may appear to be in perfect condition, yet they may be infested with a disease that will cause severe losses, he warned.

The farmer should be certain the seed used for bedding is disease-free, that the bed is clean, and that the material used is new if possible. Meyer declared. He suggested the use of a new bed in a clean location. However, if that is not possible the old bed should be thoroughly cleaned and disinfected. This might be done by completely wetting all sides of the frame with a solution of five pounds of copper sulfate (bluestone) in 50 gallons of water.

It was pointed out that a farmer is taking a chance when he buys potato plants as is true in most all cases when plants are purchased from a commercial producer, unless he is known to be reliable. The farmer who produces his own plants under proper conditions is sure of the quality, Mayer said.

Growing Sugar Cane Pays Choctaw Farmer

Milton Pearson of the Melvin Community, Choctaw County, knows the value of good farming. A few years ago he was a low-income cotton farmer living in a shabby house. But by better farming, he has increased his income and built a comfortable six-room house.

Last year Pearson grew sugar cane as his major cash crop. It was grown from third-year stubs. He protected the stubs throughout the winter by throwing furrows of dirt over them. When spring came, he swept the dirt away from the stubs and broke up the roots from the 1945 crop. The 1946 cane crop was fertilized with three-quarters of a ton of chicken manure and cultivated several times.

"I had a lot to be proud of at harvest time," Pearson says. "My total cane crop was only four-fifths of an acre. It produced 541 gallons of syrup which I sold for an average of $1.75 per gallon.

Long handle mops and dust pans eliminate stooping.

Young Leader Learns by Doing Project Work

Elmon Dowdell, Jr., 4-H Club member, Lee County, believes in getting both pleasure and profit from his project work. He has been a member of Crossroads Community 4-H Club for five years and has completed one or more projects each year.

During his first year of club work he carried a one-acre corn project. He raised 28 bushels of corn on that acre. In 1942, he increased his corn project to two acres. Elmon planted Whatlev's Prolific and fertilized it with 200 pounds of 4-10-7 and sidedressed it with 150 pounds of nitrate of soda per acre. He harvested 90 bushels of corn which he figures cost his 48 cents per bushel. He sold all of the corn. His father bought most of it and fed it to his six dairy cows.

In 1943 Elmon again planted corn. He used the same methods that paid so well the year before. But due to unfavorable weather his yield was not as high as before. That fall he harvested only 38 bushels from his two acres at a cost of 62 cents per bushel.

Elmon carried a pig project along with his corn in 1944. By having home-grown feed, he made a profit of $16 from one gilt which he sold.

In 1945, Elmon had a two acre cotton project. He fertilized it with 400 pounds of 6-8-4 per acre. A late spring with cool, damp weather gave him a poor stand but he made one bale. His cotton brought 23 cents per pound.

After paying for seed and fertilizer, clothes for the winter and books for school, he put some money in the bank. He used this money to buy a purebred Angus calf which he hopes will win a prize at the 1947 fat calf show in Montgomery.

Elmon attends the Lee County Training School. He attends all local camps, is a neighborhood leader, a leader in all recreational activities, and has been vice-president of his club for two years. He also attended the state 4.H camp at Tuskegee last summer.

Tie-Dyed and Spray-Painted

Mrs. Jessie Bradley of Rabb Community. Coneuch County, is carrying a home improvement project. She has been a club member for eight years and during this time has made an outstanding record in home improvement, poultry, and turkey project. In 1946 she improved her bedroom.

Mrs. Bradley rearranged her bedroom, made shoe and laundry bags and tie-dyed curtains and scarfs. She also made several spreads from feed sacks. To make a design, she sewed oak-leaves on the spread, then sprayed turpentine and paint over them with a spray gun. After the paint was dry, she removed the leaves.

Mrs. Bradley placed old discarded quilts between feed sacks spreads that have been tie-dyed or spray-painted. By covering old quilts she saved $25. These quilts are being used as comforts.

SHOWERS

By Vivian G. GOULED

It's nice to have
The sunshine,
Yet it's nice to have
The rain
Because it's fun
To watch the drops
Race down
The windowpane.

The big, tall trees
Get washed off clean,
And so do all
The flowers—
And that's another
Reason why
I like to see
The showers.

SHEEP

By Charles Hearn

When I was looking at the sky,
I saw some sheep go walking by.
They did not have a shepherd, though,
For they were fluffy clouds, you know.

1946 Was a Banner Year For Pantry Store Demonstrators

Three Dallas County pantry store demonstrators boast of great success in canning and storing food in 1946.

Mrs. Ethel Washington, Bogue Chitto Community, Mrs. Sarah Waller, Eleanor Community, and Mrs. Daisy Dunn, Orrvill Community, canned 1,445 quarts of fruits, vegetables and meats. They valued their stores at $430. They stored an ample supply of sweet potatoes, dried fruits and vegetables, syrup, nuts and pepper. Each homemaker has four in her family.

As pantry store demonstrator, Mrs. Waller is proud of three years of service. Mrs. Washington and Mrs. Dunn are following closely with two years in the same type of service. Each year they have improved the standard of canned products and added new canning equipment to their supplies. These homemakers use pressure cookers for non-acid vegetables (peas, corn, etc.) and meats. Water-bath canner are used for fruits and tomatoes.

Every year these plantry store demonstrators can according to the Alabama Food Conservation Budget. For each person in their family they can 66 pints of tomatoes, 66 pints of vegetables, 70 pints of fruits, 8 pints of preserves, 5 glasses of jelly, 8 pints of pickle, and 20 pints of meat. Last year they included the following on their canning list: pork, beef, game, kid, soup mixture, kraut, preserves, pickle, jelly, jam and dried beans and peas.

These demonstrators showed their stores to 116 visitors and assisted 19 neighbors with their canning problems during the year. Other farm families in their neighborhoods have been greatly helped and are canning more food and a better quality of food.

Your Living Costs

The high cost of food—which recently touched a record level—still holds an important place in the headlines. Reports of consumer resistance have come from all parts of the country. Government officials have been considering possible remedial measures. And retailers, whose prosperity depends upon a large and stable turnover, are definitely concerned.

The public should understand the position of the retailer in a matter such as this. He is literally caught in the middle—between high wholesale prices on the one hand, and consumer demand for lower prices on the other. He is without control over wages, the prices paid farmers, taxes, and everything else that enters into the final selling cost of food. What he can do is to hold down his own cost of operation to the limit, so that price increases may be as small and as few as possible. And that is exactly what nine out of ten retailers are doing.

A recent report of what happens to each dollar spent by the consumer in one of the country's principal food chains tells the story. Of each dollar sale, less than one solitary cent remained with the store as net profit. All the rest went for overhead and purchases of one kind or another—for buying goods, for rent, for salaries, for taxes, etc. This system's operating costs are the lowest consistent with running an efficient, attractive store. It is obvious, in other words, that the retailer is not the reason for the high price of food.

Time will determine the future price trend. Your retailer, if he is typical, will give you the most possible for the least money—in food and other goods.

A slightly off-center private in an army chapel was seen to bow his head every time the name of Satan was mentioned. Finally the Chaplain's curiosity got the best of him and he asked the doggie to explain. "Well," was the reply, "politeness costs nothing and, after all, we never know."

Bending over for clothespins adds extra work to wash day. To avoid stooping, make clothespin bag from heavy material and fit it over a coat hanger. The hanger will slide along the clothes line, and the pins are right where you need them.

Members of Butler County Farm Bureau Elect Officers

On November 26, more than 100 farmers of Butler County met in Greenville to renew their membership with the Farm Bureau Organization and to elect officers for 1947.

They felt the need for a stronger farm organization and believed working through in Farm Bureau they could do a better job of farming.

The program was arranged by a group of farm leaders. Rev. F. Simmons, in a discussion before the group, pictured the Farm Bureau as a democratic organization and urged all Negro farmers to take an active part. Rev. D. B. Bennett, Mt. Zion Community, stressed the importance of having a sound farm program. Prof. Robbins gave the highlight of the agricultural related study program and urged all interested veterans to get on the program.

The following officers were elected: Dave Marlow, Simpson Chapel Community, president; R. C. Carter, Mt. Rose Community, vice president; Esaw Bedgood, Bethlehem Community, secretary; Hillory Hamilton, Friendship Community, assistant secretary; James Gipson, Friendship Community, treasurer. A board of directors will be elected soon with one director from each beat in the county.

Dallas Farmers Buy 720 Acres

Forrest Kimbrough, Bogue Chitto Community, Dallas County, who has been a tenant all his life on a 720 acre farm, is now co-owner of the same farm.

Kimbrough was one of 12 tenants on the Moseley farm. Recently he learned that the farm was for sale. He know that the farm was good for livestock production and he wanted to buy it.

Thinking that several of the tenants could get together and buy the land for $11,520, he tried to organize them for this purpose. But the other 11 tenants on the farm were not interested in buying.

Kimbrough then went to see U. G. Anderson who owned a small farm joining the Moseley farm. They got together on buying the 720 acres of land. They had $1,000 each in cash and their county agent helped them to get a loan of $9,250.

The new owners are planning to improve their land. They will develop a livestock program on it. They are already improving the pasture to provide feed for cattle.

Along with developing a livestock program, these farmers are cutting logs to improe the tenant houses on the farm.

4-H Members Carry Calves to School

Alabama 4-H club beef calves are going to school to prepare for fat calf shows this spring. At least a few of them are. Here's the story.

The president and trustees, of Selma University are cooperating with the extension program in Dallas County in 4-H beef calf production. They have built a feed barn on the campus for 4-H club beef calves. Students who are 4-H members find it easier to feed and train their calves while attending the university.

The building was done mainly by the 4-H members themselves. This project on the campus has relieved fathers and mothers from caring for the calves while the boys are in school.

There is also a feed room which is 12 feet wide and 14 feed long. The boys bring their home-grown feed and store it there. Each has his own feed. Aside from the feed room, the barn has been divided into separate feed stalls for each calf. A water line was granted by the city which makes it possible to have fresh water for the calves.

This project has created a greater spirit of rivalry between this group of 4-H'ers. Each boy is working hard to make his calf the prize winned for 1947. Much attention from adult farmers also has been attracted throughout the county. Many already have made special visits to see the project.

He Grows Turkeys in Lamp Brooder

Isom Starks, Caffey Community, Lowndes County, has added turkey raising to his farm operations. In 1946 he bought 100 baby poults and raised 95 of them to market size.

His poults were brooded in a lamp brooder. He bought them for 75 cents each from the Bates Hatchery, Fort Deposit, Alabama. They were fed starting and growing mash until 8 weeks of age. Then they were given a little grain along with the mash.

On last November Starks sold 33 hens and saved the toms for the Christmas market. His hens brought him a nice sum of $216 an average of around 41 cents per pound. He sold his 62 toms at an average price of $9 on foot which brought him $558. The turkey project brought him a total of $774 in 1946.

Starks said, "I am making plans for 250 poults for this year. My feed will not cost me very much because I have made plans to grow most of it. I believe I can make money marketing corn through turkeys, even though the market may be off next season."

$9 Million Asked to Aid Mexican Cattle Disease

Secretary of Agriculture Clinton P. Anderson has asked the budget bureau to approve a $9,000,000 appropriation to defray U. S. expenses in cooperating with Mexico to eradicate the dreaded foot and mouth diseases there.

The secretary recently signed an agreement with that Republic covering administration of the eradication program through June 30.

The War Department has been asked for surplus bulldozers, trucks, jeeps and other equipment for carrying on the program, which calls for the slaughter of some 150,000 head of infected cattle during the period of agreement.

Four-H Club Boy Raises Turkeys

Autauga County 4-H clubster, Charles Frazier from Prattville Community, started raising turkeys three years ago.

He bought twelve poults from Poultry Division, Tuskegee Institute, and raised eight of them. He sold the eight and bought thirty-five poults the next year. He raised sixteen of them and sold all but five, one tom and four hens.

When Tuskegee Institute could not supply poults last year, he put his hens into production. He set some of the eggs and sold some to neighbors who wanted to get a start raising turkeys.

Due to shortage of feed Charlie kept only 35 poults to raise for sale and to continue his project this year. When the 35 were three months old cholera killed 17 of them. This did not discourage Charlie. He sold 12 of his turkeys during the Thanksgiving and Christmas seasons. He saved five hens and one tom for production next year.

Cotton Farmers Favor Acreage Allotments

Most cotton farmers favor acreage allotments and marketing quotas after 1938, it was agreed by members of the state committee and supervisors of the Production Marketing Administration, meeting in Memphis recently.

The group decided that controls for 1949 should be based on 1938-42 planting records, with some provision for farmers who produced cotton in unrestricted years after 1943.

The meeting was the first of a series designed to furnish information for drafting recommendations to be presented to Congress.

Pruning and spraying in the orchard should be done now. Do not spray during freezing weather. Insects and diseases are more easily killed early in the winter than later

Farm Devices Shown at Jackson Opening

Featuring more than 100 time and labor saving devices, many of which can be made on the farm at a low cost, the University of Tennessee Rural Progress Show had its official opening in Jackston today. Some 30,000 farm men and women are expected to see the show at one of the 24 scheduled one-day stands in that many counties over the state, officials of the Agricultural Extension Service, which is sponsoring the show, declared.

The show described as the greatest free exhibition of labor and time saving equipment ever displayed in the state will be featured in six eounties in West Tennessee, nine counties in the mid-state area, and nine counties in the Eastern section. Counties for the showings were selected so that every farm family might have an opportunity to attend without an excessive amount of driving.

By necessity farmers during the past few years have had to "watch all corners" in the saving of both time and labor in order to meet production goals, and indications are the amount of available farm labor will not be largely increased for the next few years, A. J. Simms, extension editor, told county agents and home demonstration agents at a preview showing in Columbia Friday. "Not only will the devices exhibited lessen the amount of labor necessary to complete a certain job but in many instances will make that labor less strenuous," Sims said.

Among equipment featured arc a kitchen in miniature form showing how essential devices might be arranged to save steps, and a model farm showing all the buildings and equipment necded for practical farming and living. A homemade sewing cabinet large enough to hold all articles needed in family sewing, a movable wood box, and a wheel table with lap board are among the 20-odd exhibits in the home management and clothing department of the show.

The poultry division features a movable poultry house, homemade lamp brooders, feed hoppers, summer range shelters, electric brooders, and a poultry waterer made of a 50-gallon oil drum mounted on wheels. A miniature buck rake, seed thrasher and feed mixer, hay windrower, farm shop equipment, and a barn hay dryer are included in the agricultural engineering section.

All items—both new and old—that help to make cooking and home canning easier are displayed in the food and nutrition division. An exhibit which will attract the eyes of all dairymen is the model milk parlor featured in the dairy section. In the farm and home department one may obtain helpful suggestions in home planning and beautification, as well as valuable ideas on the use of electricity.

Officials of the show believe there are numerous worthwhile ideas for any farmer in the state, from the poorest to the richest.

The exhibits will be transported to the various points in the state in a 40-foot trailer truck. A staff of specialists of the Extension Service will explain the show to visitors.

Lab Finds Causes of Animal Deaths

Free service to determine eauses for death of farm animals is being given by the State Veterinary Laboratory at Auburn.

If cattle or other livestock begin to die from an unknown eause, the owner or his veterinarian can call on this laboratory to find why the animals died.

When blood samples or droppings are reeeived at the laboratory, a quick and accurate study is made. The owner is notified immedately of the cause of death. Then the farmer can treat the disease and control its spread.

A pamphlet may be obtained by writing the laboratory.

Nitrogen Increases Bluegrass Seed Yield

Spring application of nitrogen tripled bluegrass seed yields in tests made by the University of Kentucky Experiment Station in central eounties in the Bluegrass region last year. Where 125 pounds of ammonium nitrate were spread to the acre, seed production averaged 44.6 pounds, compared to 13.5 pounds where no nitrogen was used.

Applying nitrogen in the fall brought only 21.3 pounds of seed to the acre.

Nitrogen applied in the spring increased the amount of early grazing, and probably added to the value of the pasture after the seed was stripped.

Applications of potash and phosphate brought little increase in seed yields on typical Central Kentueky bluegrass soils.

Milk Poundage In Tennessee Sets New Record

The total poundage of milk produced on Tennessee dairy farms during the past year set a new record of 3,720 pounds of milk per cow, the State Department of Agriculture has announced.

While the number of cows milked during 1946 was the smallest number since 1942, it totaled 599,000 head. In the United States as a whole, the milk production was reported by the U. S. Department of Agriculture as being off one-and-one-half per cent in comparison with the 1945 output.

The pounds of milk used on farms, sold to dairies and used in other forms totaled 2,223,000,000, it was announced. This amount is reported as being less than 1 per cent greater than the 1944 and 1945 output, however, indications for the 1947 are that the production record set during the past twelve months will be surpassed by several millions pounds of milk

In the United States last year, the Agriculture Department reported, 24,479,000 cows in the milk barn produced 119,730,000,000 pounds of milk. The Tennessee production per animal was 1,171 pounds under the United States average for the year, a report for the year revealed.

More Fertilizer Needed

Between 800,000 and 850,000 tons of nitrogen will be needed for U. S. domestic consumption for fertilizer use during the year 1947-48, it was indicated by members of the Fertilizer Industry Advisory Committee who met here Thursday with officials of the U. S. Department of Agriculture and other Government agencies interested in the fertilizer problem.

The record supply of approximately 725,000 tons of nitrogen available for domestic use during the current year is said to be considerably short of the record demand by American agriculture.

Man in Boots Save Soil

Rain hat, raincoat and rubber boots are good soil conservation equipment on many farms says the U. S. Department of Agriculture. The Soil Conservation Service says that a walk through the fields in the rain, while runoff is gathering and flowing, is a good way for a farmer to spot the weak points and imperfections in his soil saving measures and so be ready to correct them when the sun shines again.

White and eolored farmers who are succeeding in holding their soil get satisfaetion from seeing that any surplus water that does get away carries no fertile topsoil. It has been estimated repeatedly that in one season 21 times as much soil fertility is taken away by run-off as it removed by crops. It is the first few months and then years after a soil eonserving program is adopted that walking the fields during the rain is most important.

Family Food Bill Drops Slightly

Washington—(AP) — The consumers' price index went down two-tenths of one per cent during the month ended February 15—the second minor decline since December, the Bureau of Labor statistics reported yesterday.

Deelines in the family food bill more than offset higher prices for other major items in the family budget, the bureau said.

The index, formerly called the cost-of-living index, stood at 152.8 on February 15. The base period from 1935 to 1939 is figured at 100 for comparison.

Other figures from the index:

In mid-February, consumers' goods and services used by families in large cities were 17.9 per cent higher than a year ago and 51.6 per cent above the January 1, 1941, level.

Retail Food Prices Drop

Retail food prices in large cities dropped .8 per cent between mid-January and mid-February and were 2.9 per cent below the mid-November record high of 187.7. A seasonal drop of 6.5 per cent in egg prices was accompanied by a 3.6 per cent decline for dairy products and lower prices of meats, fish and poultry. Fresh fruits and vegetable priccs advanced 2.8 per cent on the average during the month. Green beans increased 35 per cent and lettuce 13 per cent. Coffee and sugar continued to advance.

Clothing priccs advanced for the 14th eonsecutive month, and were 1.1 per cent higher in mid-February than in mid-January. They have risen almost 80 per cent since August, 1939.

Women's Clothing Advance

Women's clothing advanced sharply between mid-January and mid-February. Higher prices were reported for cotton house dresses, rayon dresses, hosiery and undergarments, reflecting earlier increases in manufacturers' prices. Men's suits and top coats and work clothing also went up in most cities. Footwear rose 1.2 per cent during the month.

House furnishings increased .6 per cent between mid-January and mid-February. Washing machines, gas stoves and floor coverings continued their rise. Higher prices for gasoline, newspapers, motion picture admissions, and beauty shop serviees helped to boost prices in the miscellaneous goods and services group .1 per cent.

Rents Go Upward

The rent index, based on rent changes in six eities, rose .1 per cent to 108.9 on February 15. Rents advanced .3 per cent in Memphis and New Orleans, and .4 per cent in Washington since last September. Philadelphia experienced a rent boost of .4 per cent since last August.

Fuel, eleetricity and ice costs rose .2 per cent on the average. A rate change in Philadelphia boosted costs to domestic consumers by 11 per cent. A reduetion in rates in Denver lowered electricity costs there by 21 per cent.

They're Cooking With Gas Now

Mr. and Mrs. Percy Young, Darlington Community, Alabama, are the first farm family to enjoy the gas heating system recently installed in Wilcox County.

Having gas put in the home has lightened the work of the elderly Youngs. Wood eutting and early rising to build fires for warming the house and cooking have stopped.

"It is so mueh easier and quicker to get meals with gas. Now there are two other things we want and we will get them just as soon as they come this way. They are electric lights and a telephone. You know, I feel like all of us should get some of the things that are here on earth for us," says Mrs. Young.

The Youngs have a gas heater in their bed room and a gas range in the kitchen of their six-room home. They will install more gas heaters when they can find the types needed.

4,000 Soil Samples Are Analyzed

More than 4,000 soil samples have been analyzed at the U-T Soil Testing Laboratory, 2321 West End Avenue, Nashville, since February 1, Bruce W. Hacther, assistant extension agronomist, said today. This represents more than a 50 per cent increase over the same period a year ago, he said.

Samples from pastures and areas intended for pasture are in the majority. That is partially due to the fact that some counties have made soil testing a requirement before payment will be made by the ACA for the soil conservation practice, the agronomist said. Although there are many farmers who have soil tested only where they intend to grow legumes or pasture crops. the number of samples from tobacco, corn, cotton and other row crop fields has shown a noticeable increase during the past year, Hatcher declared.

With the increased number of soil samples arriving at the laboratory, Hatcher said, it is requiring almost two weeks for his office to return to farmer analysis records and recommendations for the intended crop. He warned farmers to allow at least that amount of time when samples are sent in for analysis. "We are often handicapped because many farmers do not enclose complete information on the plot from which the soil was taken, and often they fail to show what crop will be grown next," Hatcher said.

When the needed information is lacking it is nccessary for the soil testing office to contact farmers. "That, of coursc, causes extra work on the part of the laboratory personnel and delays the return of the information to that farmer," he emphasized.

Information of the collection and transmitting of soil samples to the laboratory is available at all county agricultural agencies. "It is not necessary that the soil be dry at the time samples are collected. Many farmers might save several days by collecting samples now," Hatcher said.

$62 Is Top Price on Springfield Tobacco Market

The top price for tobacco on the Springfield market went to Homer Douglas of near Joelton when he sold his dark fired tobacco for $62 per hundred.

Grown by unorthodox methods, Douglas received the following prices for his crop: trash lugs, $21.50; good lugs, $26.50; seconds, $55; short leaf, $44; light cigar leaf, $57; dark cigar leaf, $61 for two baskets, and dark cigar leaf, $62 for one basket.

Douglas, who said that he did not believe in deep cultivation of his crops, did not use any fertilizer under his plants, however, he said that he used 500 pounds of 4-8-8 fertilizer per acre as side dressing and two applications of 16 per cent nitrate totaling 700 pounds.

He added that the land had not been in eultivation for some seven years.

Another good crop reported on the Springfield market was that of H. W. Frey of near Coopertown in the 13th Civil Distriet.

His crop netted a floor average of $41.71.

Sumter Co. Farmers Study Organization

At a regular meeting of the Sumter County Leaders' Association held in November, plans were made for a Farm Bureau membership drive among Negro farmers. The president of the County Farm Bureau met with the leaders and stressed the value of organization among farm people.

For making this drive the county was divided into eommunities and neighborhoods. Then leaders were appointed to contact farmers in eaeh neighborhood.

A goal of 400 members was set and recent reports from the leaders show that they are making progress toward reaching this goal.

Plans Cotton Research

After a two-day study of the Research and Marketing Act. of 1946 and its potential application to cotton problems, the Cotton Advisory Committee recommended the early appointment of a special technical group to carry its work forward, the U. S. Department of Agriculture has announced.

This group would work with Department and industry technicians in drafting a comprchensive cotton research and marketing program for consideration by the National Advisory Committee at its next meeting, April 14-16.

The cotton advisory committee is the first of 20 commodity groups to organize for its part in developing proposals for using the new research legislation.

Anderson Releases Report on '46 Cotton Price Break

Further corrective measures are needed to avoid such speculative excesses and price disturbances as occurred in the cotton futures markets last fall, Secretary of Agriculture Anderson said in releasing an extensive report by the Commodity Exchange Authority on the October 1946 break in cotton prices. Facts developed by the CEA investigation have made it necessary to re-examine the regulatory limitation on the size of speculative holdings, and give consideration to the margin-rate situation of the cotton exchanges.

Secretary Anderson said the CEA investigation showed that the price break which dropped cotton prices 8 cents per pound in two weeks last October was accelerated and extended by the forced liquidation of many thinly-margined speculative holdings, and the collapse of two large accounts. The extension of credit for speculative purposes to so-called hedge accounts also contributed to the vulnerable position of the October cotton market. The title of the CEA report is: "Collapse in Cotton Prices, October, 1946."

Increased Farm Production Suggested for South in 1947

The Bureau of Agricultural Economics of the U. S. Department of Agriculture points out that because the prospective demand for Southern farm products this year is generally good, white and colored farmers may find it advantageous to continue planting more row crops than is good for the land. However, Soil Conservation Service officials say that Southern farmers recognize the need for increasing their conservation practices.

BAE indicates that larger acreages of cotton, sweet potatoes, soybeans for beans, and sugarcane for sugar seem in order. This is also true for feed grain and forage crops. However, smaller acreages seem desirable for peanuts for nuts, potatoes, burley tobacco, and flue-cured tobacco to a slight extent.

Increased output of red meats and milk should prove profitable for Southern farmes, says BAE.

Monroe Farmers Grow Nitrogen

Chanees for a very short supply of nitrogent fertilizers next spring spurred Monroe County farmers into planting the largest acreage ever grown in winter legumes.

Last fall 191 farmers planted 29,200 pounds of Austrian winter peas, 21,400 pounds of blue lupine and 89,000 pounds of Willametts vetch. In 1945, 77 farmers planted 20,000 pounds of Austrian peas, 3,600 pounds of veteh, and 2,900 pounds of blue lupine.

These farmers realize that the surest way to get nitrogen is to grow it. They also have found that winter legumes help in stopping erosion.

New Editor for Ebony Rhythm

New York, N. Y.—Appointment of Beatrice M. Murphy, distinguished Negro poet and critic, as editor of "Ebony Rhythm," an anthology of contemporary Negro verse, was announced today by the Exposition Press of New York. Negro poets are requested to submit their poems, whether previously published or not, directly to Mrs. Murphy, 4928 Just St., N. E. Washington 19, D. C. Manuscripts should be accompanied by a self-addressed, stamped envelope for the return of unavailable poems.

This anthology will serve a primary purpose in identifying Ncgro poets and establishing their reputations among their own people. By more fully acquainting the American Negro with the literary ability of his own race, by fostering in him a natural pride in those of his people who are outstanding, and by presenting poetry particularly indigenous to Negroes, "Ebony Rhythm" will make a specific cultural contribution to American literature.

The book will embrace a wide range of poetic achievement. Mrs Murphy, who edited "Negro Voices" an anthology, in 1938, hopes that "Ebony Rhythm" will surpass the former collection.

The Hope of the World

The hope of the world lies in the American government—and the American private enterprise system which underlies it. As our international commitments grow, more and more people in nations which bore the full physical brunt of war look to us for succor.

Already, American industry has brought new vistas of properity and progress to remote parts of the world. The work of the Arabian-American Oil Company in Saudi Arabia is a dramatic example of this. The company is financed and operated by a group of four United States oil companies. It is pouring gigantic sums—the total may run as high as $300,000,000—into Saudi Arabia to develop hitherto untouched oil resources that are there. In the process, it has brought modern medicine to the peoples of the region. It has started great agricultural experiment projects. It has built model villages and good roads Thus, with free enterprise at the helm, social progress and economic development go hand in hand—precisely as they have always done here at home.

In the coming years American industry in many fields will carry on work of this nature. The techniques developed in thc new world will be applied to the resources—and the rehabilitation—of the old. Millions of pcople, who know little of American ideals of liberty, will see the superiority of the free enterprise system over the totalitarian system—regardless of what name it wears. The American oil industry is a product of free opportunity upon which our nation was built.

Bedspreads Made from Farm Sacks

Farm women of Marengo County have found many uses for feed and fertilizer sacks. Clothing and household linens are two of the major uses and interest has been shown

To help women make better spreads, Home demonstrationcm spreads, Home Agent Rhetonia Perry has given demonstrations in 15 clubs. Here are the steps she taught them.

1. Sacks are washed and bleached.
2. Those to be used for the spread are cut the same size.
3. Then they are sewed together and dyed.
4 Spread is hemmed and design is stamped or drawn on it.
5. A basting stitch of yarn is run on the design. It takes up one-sixth inch of cloth and leaves one-half inch of yarn extending.
6. Double strands of yarn are used for heavy pile.
7. After all basting stitches are made, each one is clipped with scissors.
8. After clipping stitches, the article is washed with milk soap in warm water.

Begin Spraying Lawns Now to Rid Them of All Weeds

By Dr. Floyd Bralliar
Garden Editor The Nashville Tennessean

We shall soon be at the most critical time of the year as far as our lawns and gardens are concerned. There are many things we can do that will relieve the pressure of work two weeks later, when garden planting should be at its peak.

The first of these is to spray our lawns with one of the new weed killers. Dandelions are at their most rapid growth now and many other weeds are young and tender. They are easier to kill now than they will be at any future time. Spray with any of these new preparations (they are all practically the same but named and put out by different firms) according to directions on the container

It will usually pay to spray twice or even three times in order to be sure to kill all weeds. These sprayings should be at intervals of a week. All weeds will be killed and so will all clovers, but the grasses will not be injured. Be careful to not let the spray hit any shrubbery or trees you do not want to kill. It is very effective in killing wild honeysuckle.

Do not delay about planting English peas. They should have been planted some time ago, but should produce a crop if planted before April 5 or even April 10.

Make your main planting of gladiolus at once if you have not already done so. The same is true for tuberoses except that they should be planted in a box of moss or sand and set in a very warm place to start growth. Many people fail with tuberoses because they do not realize that these bulbs require a long season in which to mature and that they are frost tender. Start them in a warm place and set them out the last of April, being careful not to break off any tender roots they may have formed.

If you intend to grow any callas in the open ground plant them now but cover the top of the bulb at least three inches deep.

If you plan to set any perennials do so at once. At this time they will start new growth at once and should do much better than if set later. Of course newly dug plants are better than those that have been out of the ground for weeks no matter how well they have been kept.

In the vegetable garden it is now time to plant all seeds but okra, beans of all kinds, and all vine crops. None of the latter should be planted before the tenth or fifteenth of April. To plant these now almost surely means to loose the seed, but to wait two or three weeks before planting the hardier vegetables means a late and usually a smaller crop.

No it is not too late to set out fruit trees, roses, or even spring blooming shrubbery if thrifty plants are used, plants that have not been allowed to dry out after they were dug, and if they are carefully set out, properly pruned and kept watered until the roots have had time to throw out new root hairs and so take hold on the soil in their new location, but it is necessary to prune harder if these plants are set late than if they had been set a month ago.

We were pleased to see hollyhocks become more popular that they were a few years ago in the South. The plants are always low in price and are sure to grow and bloom if given even half a chance. As a background or as a flower planted in clumps among the shrubs in the border they have no superior. They are generally grown in mixtures. The plants can also be had in color. The singles are most widely grown and this is as it should be, for beautiful as the doubles are, the singles are more artistic.

Stokesia, wild in southern Louisiana, is one of the most lovely of our perennial flowers either for cutting or as a border plant. It will withstand our southern heat, and with the writer, it blooms for at least two months, just when good cut flowers are hard to get. The plant will grow in any fairly good soil for a long time. The color is soft blue and the flower is thistle like in appearance. It will last for ten days if cut as soon as it opens. We highly recommend it for the entire South.

Swine Parasites Costly

Internal parasites are reducing the value of market hogs in the Southeast more than 50 cents a head, or at least $50 for a shipment of 100, according to recent survey by the Bureau of Animal Industry of the U. S. Department of Agriculture.

That amount is the approximate direct loss caused by condemnations of parsitized livers, kidneys, casings, and affected parts of the loin and other cuts, in establishments operating under Federal meat inspection. Though the immediate loss falls on packing establishments, farmers pay for it through lower prices received for their hogs. There are additional farm losses, too, in the form of deaths, retarded growth of hogs, and increased food costs.

Plan Now

To plant Tennessee hybrid corn this year.

To file 1947 farm plan with your local AAA officials at an early date.

To continue to feed dairy cattle a high grade of roughage, at least until pastures are sufficient to supplement it.

To set at least a few dozen raspberry, gooseberry, and blackberry plants this month.

To have all plows and other machinery in readiness for early spring work.

To contribute to your local Red Cross Chapter.

To have garden seed ready and prevent loss of time when the soil is dry enough for planting.

To insure your cotton crop through the federal government's "all-risk" crop insurance program.

To study the possibilities of growing sheep on your farm. Records show that though sheep pay greater net returns than any other type of livestock, the sheep population in the United States is declining.

To grow your own sweet potato and tomato plants unless you are sure those you buy are disease free.

To apply nitrogen fertilizers to small grain crops at the earliest possible date.

To waste none of that barnyard manure.

To complete the job of pruning all fruit trees within the next few days.

To have all necessary equipment and materials ready for the spraying of fruit trees, as well as garden crops.

To increase the average production of dairy cows in Tennessee through better management which will include better pastures.

To remove all accident hazards about farm buildings before you become so busy you won't notice their presence.

To mow pastures at least two times during the season.

To provide an adequate supply of water for all types of livestock.

To finish pruning all fruit trees before buds begin opening.

To take advantage of the earliest possible date for planting an early garden. Often the first periods suitable for planting last less than one day.

To broadcast fertilizer over the potato field and plow it into the soil rather than apply to the furrow at planting time, as is the custom.

To provide a place for birds to nest, if you enjoy having them about the house.

If you do not have drying forms, trace outlines of knitted garments such as dresses or sweaters on heavy brown paper before washing them. They may then be stretched to proper size while wet.

Some 200,000 Alabama farm families produce over $20,000,000 worth of vegetables in their gardens each year. In addition, 50,000 gardens are grown by people who live in towns and cities.

USDA Develops New Method of Extracting Cottonseed Oil

Development of a new method for solvent extraction of oil from cottonseed that also removes in the same operation the objectionable pigment material in the seed has been announced by the U. S. Department of Agriculture.

Removal of the pignemt is regarded as an important advance over any previous method of processing cottonseed. The process provides for complete recovery of oil—and of a purer oil. The remaining meal is lighter colored and unmodified by heating and promises to have wider use as a protein source for industrial use. There are definite indications that the depigmented meal may bc more desirable as feed for chickens and swine.

The method is regarded by the cottonseed industry as significant and fortunately timed. As a result of wartime developments in the oil situation several commercial firms are now constructing new plants for solvent extraction of cottonseed.

Basic research at the Bureau of Agriculutral and Industrial Chemistry's Southern Regional Research Laboratory at New Orleans, La., is responsible for this method which is a radical improvement in the extraction process.

The "Cinderella story" of cottonseed has been told rcpeatedly. Cottonseed was first regarded as a bothersome waste which piled up at the cotton gins and had to be disposed of at expense to the ginner. It was then used as a fertilizer. As the value of the oil came to be known the oil mills developed, usually as small scale plants operating for only a few months with rather crude equipment and unskilled labor.

Increasing use of the oil for shortening and in food, in soapmaking and for other industrial purposes gave the cottonseed increasing value as an important byproduct of the cotton industry with income from seed providing an increasing proportion of the income from the crop.

Cellulose chemistry, which provided a market for the linters on the seed, led to better equipment of plants so that there are now only about half as many "oil mills" as there were at one time, with each mill handling about twice as much seed on the average. Development of solvent extraction would probably lead to a further decrease in the number of miles and corresponding increases of average capacity.

Farm Families Want Better Fitting Clothes

The American farm family wants better-fitting clothes that are colorfast and won't shrink or stretch.

This was one of the conclusions reached by 52 States extension clothing specialists from 42 States and Puerto Rico who rccently attended a national clothing refresher course conducted by the Department of Agriculture's Extension Service with the Bureau of Human Nutrition and Home Economics cooperating.

The clothing specialists also went on record for simple, functional designs in children's clothing.

In their meetings these cooperative employees of the Department and the State Agricultural colleges unanimously took the stand that the large amount of cloth now on the market dyed with colors that fade or run is bringing great dissatisfaction and represents a money loss to farm families. This is especially true in the case of men's and women's clothing for home and farm work and children's clothes. These should be dyed with vat dyes or dyes of equivalent fastness that will stand washing, sun, and perspiration, the specialists said.

Rural homemakers as well as city consumers want clothes that will not lose their fit when washed, the specialists pointed out in emphasizing the importance of shrink-resistant finishes for all wash fabrics and garments.

Corncobs Now Used in Nylon

Oklahoma City, March 27—(Ap)—Twelve years of research costing $1,000,000 has resulted in the development of a chemical process for use of agricultural by-products such as corncobs in the manufacture of nylon. Dr. Oliver W. Cass research chemist for E. L. du Pont De Nemours & Co., announced today.

Cass, in a speech to the National Farm Chemurgic Council, disclosed that the use of the products, such as corncobs, cotton seed hulls and the hulls of oats and rice bran, would give a supplemental supply of ingredients needed in the manufacture of nylon.

Nylon originally was derived only from the components of coal, air and water. Cass pointed out petroleum and natural gas are now used along with coal and that the new development would be still another substitute.

Cass said that a new unit will be built at the duPont electrochemicals department's plant at Niagra Falls to produce the chemical. The main advantage in the use of agricultural by-products in the manufacture of nylon, Cass pointed out, is that they are replaccable sources. Coal and petroleum now being used are irreplaceable.

Colored Virginia Farmer Solves Storage Problem

Mrs. T. W. Bland, farm woman of Rocky Branch, Va., solved her husband's sweetpotato storage problem last fall by designing a straw and sawdust insulated storage house built of logs, reports State Agent Ross W. Newsome of the Virginia State Extension Service.

Every year Mr. Bland had been unsuccessful with the storage of the potatoes, says Mr. Newsome. Last fall he and his wife got to thinking about plans for building a better storage house. She decided that for one thing it ought to be better insulated. So, with trees cut from his own farm, Mr. Bland built a log house with a slab roof which is insulated with straw and sawdust.

The storage house is heated by a small wood heater. Last fall Mr. Bland put in 400 bushels of potatoes. Last week he reported to his Extension county agent that his potatoes have kept in excellent condition. He says that this is the first year that he has been able to keep all of his potatoes through the winter.

Colored Kentucky Farmers Launch Improvement Program

A farm improvement program designed to promote better health and modern farming practices has been launched in two counties by Farm Agent Bennett K. Brown, reports the Kentucky State Extension Service.

During the first year of the program, 28 sanitary toilets have been built, 78 wells have been relocated in line with soun sanitation, and 13 homes have been remodeled. Also 14 farmers have built new barns, 11 have constructed milk sheds, and 23 have built brooder houses.

Farmers Praise Winter Grazing,

A. H. Kiser of the Gosport Community, Clarke County, is grazing nine head of cows on fice acres of oats and vetch planted early this fall "My grazing crops have helped me keep my cows in better condition than they have ever been in winter," Mr. Kiser says.

Nine farmers in the Ebernezer Community planted 102 acres of land in cover crops, including seven acres of church land. This acreage is planted to vetch. Austrian winter peas, and blue lupine. In the West Bend Community, nine farmers Planted 286 acres of cover crops.

In Thomasville and Gosport Communities, around 400 acres of land are green with winter cover crops.

WOMAN'S PAGE

New Sugarcane Variety

A new variety of sugarcane, suitable for the Louisiana area has just been released by the U. S. Government of Agriculture. The new variety is called C. P. 36-13 and is sponsored by the Department, the Louisiana Experiment Station, and the American Sugarcane League. Louisiana planters will have the first of it to plant this fall.

JELLIED TOMATO BOUILLON

1 cup tomato juice, 2 packages of aspic-flavored gelatin, 1 tablespoon lemon juice, 3 cups tomato juice. Red food coloring (optional).

Scald one cup tomato juice and add gelatin. Stir until dissolved and add lemon juice and remaining tomato juice. Add more seasoning if necessary. Add red food coloring, if a deeper color is desired, and turn into bouillon cups and chill. Four servings.

ITALIAN STEAK WITH TOMATO SAUCE

Cut slices of round steak three-quarters of an inch thick. Season with salt and pepper. Dip into beaten egg, then in bread crumbs and brown quickly in olive oil. Remove from pan to baking dish. Add tomato sauce and bake slowly for 45 minutes, or until meat is tender.

APPLE ROLL WITH VANILLA CUSTARD

Baking powder biscuit dough
2 tablespoons softened butter
4 to 5 apples, finely diced (about 3 cups)
1-4 cup brown sugar, packed
1-2 teaspoon cinnamon
Few grains nutmeg
2 tablespoons lemon juice
Grated rind of 1 lemon

Prepare baking powder biscuit dough; roll out into a rectangle 8 inches by 12 inches Spread top with a tablespoon of soft butter. Pare, core and dice apples; spread to within 1-2 inch of edge of dough. Blend brown sugar, cinnamon, nutmeg, lemon juice and rind. Sprinkle mixture over apples; roll dough up like jelly roll. Cut roll crosswise into 1 1-2 inch thick slices. Place on well-greased baking pan and dot with extra tablespoon butter. Bake in a hot oven, 425 degrees, for 25 minutes. Serve hot with vanilla custard. Serves 8.

CHOCOLATE ICE CREAM

1 square (1 oz.) unsweetened chocolate
2 3 cup Eagle Brand Sweetened Condensed Milk
2 3 cup water
½ teaspoon vanilla
½ cup whipping cream

Set refrigerator at coldest point. Melt chocolate in top of double boiler. Add Eagle Brand Sweetened Condensed Milk and stir over rapidly boiling water for 5 minutes or until thick. Add water and mix well. Chill. Add vanilla. Whip cream to custard-like consistency. Fold into chilled mixture. Cover with waxed paper and freeze in freezing unit of refrigerator unit half frozen. Stir with a spoon until smooth but not melted. Replace waxed paper and returrn to freezing unit until frozen Serve 4 to 6.

COTTAGE CHEESE DRESSING

Mix together teaspoon salt, 1-2 teaspoon mustard, dash white pepper, 4 drops hot sauce, 1-2 teaspoon sugar, 1 tablespoon vinegar and 1-4 teaspoon onion juice. Beat 1 egg yolk in a deep bowl and add vinegar mixture. Continue beating, meanwhile adding 1 cup of salad oil—drop by drop at first, gradually increasing the amount. Slowly add 1 tablespoon vinegar and beat well. Chill. Just before serving, add 1-2 cup cottage cheese, drained, and stir until smooth. Sprinkle with paprika. Serve over coleslaw in tomato cups.

NEAT PASTRY TRICK WITH CELLOPHANE

Hear's a tip that will save you a lot of trouble next time you roll short dough for baking. Cellophane will keep it from breaking up into little pieces when you try to spread it in the pan.

Just take two sheets of cellophane, put the dough between them and roll it as thin as you wish. Then remove the top sheet, and place the pan upside down over the dough. Slip one hand under the bottom sheet of cellophane, place the other one on the bottom of the pan, and flip over dough, pan, and cellophane all at once—right side up in a jiffy. The dough settles neatly into the pan without crumbling ,thanks to the cellophane support. Then remove the cellophane. Your rolling pin and pastry board will be as slick and clean as when you started to use them. No sticky bits of dough to soak off or scrub. You can put them away until you're ready for the next batch of pies or cookies.

SOYBEANS PAY OFF!

Murphysboro, Ill., Dec. 23—(AP) The Murdate Airport reported today that of its $1,500 return the past year on a $5,000 investment, $200 was profit on a crop of soybeans planted between runways.

NEW DISCOVERY! ICE CREAM THAT'S BETTER MADE WITH LESS SUGAR!

By Mary Mason

Here's a brand-new way to make the best rennet-custard ice cream yet—even smootheir, creamier, more delicious: Replace half the sugar with corn sirup! When we tried it in our test kitchen, tasters agreed the result was "out of this world." Made in an automatic refrigerator, with only light cream, it tasted like old-time hand-freezer ice cream. Try it yourself—today!

Vanilla Ice Cream

1 "Junket" Brand Rennet Tablet
1 tablespoon cold water
2 cups light cream
1-4 cup sugar
1-4 cup corn syrup (Karo, Sweetose, etc.)*
1 1-4 teaspoons vanilla

Dissolve "Junket" Rennet Tablet by crushing in cold water. Mix light cream, sugar, syrup and vanilla. Then follow directions on the package for making rennet-custard. Pour at once, while still liquid, into freezing tray. Do not move until set—about 10 minutes. Then place in freezing compartment and freeze until firm. Remove to bowl, break up with fork, and beat with rotary beater until a thick smooth mush. Finish freezing.

*Corn syrup may be replaced by 1-4 cup sugar; or by 1-4 cup sweetened condensed milk. OR omit both corn syrup and sugar and use 1-3 cup honey.

CREAM OF TOMATO SOUP

6 large tomatoes, diced (6 cups)
1-2 cup coarsely chopped onion
1-2 cup sliced carrot
3-4 cup chopped celery
1 bay leaf
2 whole cloves
3 peppercorns
1-8 teaspoon thyme
1 1-2 teaspoons salt
1 teaspoon sugar
1-4 teaspoon soda
2 cups hot cream sauce

Combine tomatoes, onion, carrot, celery, bay leaf, cloves, peppercorns, thyme, salt, and sugar. Cover and heat to boiling temperature then let simmer for 20 minutes, or until vegetables are soft. Force through a sieve. Stir in soda. Combine with hot cream sauce. Makes 4 large servings.

Note: One No. 2 can of tomatoes may be substituted for fresh ones.

Cream Sauce

Melt 2 tablespoons butter or margerine, add 2 tablespoons flour and 1 teaspoon salt. Stir until smooth. Slowly stir in 2 cups milk. Cook over low heat, stirring constantly, until sause is smooth and thickened. Makes 2 cups of sauce.

GLAZED ONIONS OR CARROTS

Cook small white onions or new carrots in boiling salted water 15 or 20 minutes or until tender. Drain. Let stand a few minutes to dry. Melt four tablespoons butter in pan. Add 1-4 cup honey. When well blended, add onions or carrots and cook slowly until browned and well glazed. Turn vegetables occasionally for an even glaze.

COOKIE COOKING TIPS

To make cookie-baking less of a chore, here are a few tricks to speed up the operation:

Be sure your shortening is room temperature and never firm. Speeds creaming.

Save on fat and use any meat drippings for ginger, molasses and spice cookies. Just increase the spice to mask the meat flavor.

Roll ice box cookies in wax paper. Makes nice even-shaped cookies.

Butter all cookie pans at once and stack them cross wise on one another. Saves space in the kitchen.

Dry the cookies after baking by placing them on a wire rack before placing them in the cookie jar.

RAISIN PEACH SALAD

1-2 cup seedless raisins
1 1-2 cups cottage cheese
3 tablespoons pickle relish
Salt to taste
2 canned pimientos
6 large peach halves
Lettuce
Mayonnaise

Cover raisins with boiling water and let stand 5 minutes; drain, dry on a towel, slice, and cool. Combine with cottage cheese, pickle relish, salt, one pimiento cut fine and blend lightly. Place peach halves on lettuce-garnished salad plates and fill centers with raisin cheese mixture. Garnish with mayonnaise and slices of the remaining pimento. Serve Very cold Serves six.

DRESS TO TASTE

Salad deserves a wardrobe of many dressings, French models being adaptable to some desirable variations

By Mary Lyles Wilson

Doing what comes naturally, in the case of salads and their dressings, is far too often just a matter of dabbing a spoonful of mayonnaise on every one that's served—sort of a lackadaisical afterthought that will soon have the family rebelling against the most attractive concoction of greens and fresh foods.

Only with varied dressings will family interest in vitamin-filled salads perk up and stay perked up from day to day. A light, low-calorie dressing, mixed with an eye to zest and imagination, will give new appetite appeal to any salad. French dressing, the standby for many years, is always a pleasant variation from the heavier dressings, and the smartest American restaurants join the modest housewife in appreciation of its economy and simplicity.

The rapidly increasing popularity of easy-to-make French dressings is due perhaps to the increasing use of the salad bowl. The foods in this type of salad are naturally tossed and in order that every morsel of the salad may be enhanced by the tang of its dressing, a liquid mixture is always preferred.

One of the nicest things about French dressing is the variations possible from a basic recipe such as the one given below. New flavor shades are gained by the simple addition of other ingredients, and the dressing is ready for use on any green salad, as a topping for many hot vegetables or for marinating salad ingredients.

Basic French Dressing

1-2 tsp. salt
1-2 tsp. sugar
1-4 tsp. paprika
Dash white pepper
1-2 tsp. dry mustard
1-2 cup salad oil
1-4 cup cider vinegar
on lemon

Combine first five ingredients in a jar and blend well. Add vinegar; cover and shake; add oil and shake again thoroughly. Just before using shake again. Or, simply mix ingredients together in a bowl and beat with mixer until well blended, about three minutes.

This makes 3-4 cup of dressing, ample to serve four people. If you wish, you can double the amount of ingredients in this recipe and store half in a tightly covered jar in refrigerator for future use in making one of many variations suggested.

Tossed Green Salad

Wash and drain dry, head lettuce. French endive, romaine, curly endive, escarole, radishes and watercress. Chill thoroughly. Rub salad bowl with clove of garlic. Cut or break head lettuce into small pieces; over this break into small pieces the remaining greens, with exception of radishes. Dot with thin slices of radishes. Add French dressing and toss thoroughly before serving. Serves four.

Peanut Butter Dressing

Combine in bowl, then beat thoroughly until well-blended, 1-4 cup peanut butter, 1-2 cup oil, 1-4 cup cider vinegar, 1-2 teaspoon salt, 1 teaspoon sugar and 1-2 teaspoon paprika.

Club Dressing

1-2 cup French dressing
3 tbsp. finely chopped scallions
3 tbsp. tomato juice
1 tbsp. Worcestershire sauce
1 tbsp. sugar

Blend all ingredients thoroughly or shake together in tightly-covered jar.

Cole Slaw

1-2 head cabbage, finely chopped
1-2 green pepper, thinly sliced
2 pimentos, thinly sliced

Mix well and toss with olive dressing.

Olive Dressing

1 cup French dressing
1-2 cup chopped ripe or stuffed olives

Blend all ingredients thoroughly or shake together in a tightly-covered jar.

Bowl of Salad Greens

1 head escarole
1 head lettuce
2 ripe tomatoes

Wash salad greens and tomatoes, dry and chill thoroughly. Line salad bowl with escarole; heap on this the lettuce, cut in small pieces, and the tomatoes quartered. Add onion dressing or Parmesan dressing before serving and toss lightly. Serves four.

Onion Dressing

3-4 cup French dressing
1 tsp. onion junce
1 1-2 tsp. ketchup

Blend all ingredients thoroughly or shake together in tightly-covered jar.

Parmesan Dressing

Add two tablespoons grated Parmesan cheese to 3-4 cup French dressing. Blend well or shake thoroughly in a tightly-covered jar.

Garden Dressing

1 cup French dressing
6 large finely-chopped radishes
2 sieved hard-boiled eggs
1-4 chopped green pepper
2 tbsp. finely-chopped onion
2 tbsp. finely chopped parsley

Blend all ingredients thoroughly, or shake together in tightly-covered jar.

Bridge Luncheon Salad Bowl

French endive
Romaine lettuce
Curly endive
1 cucumber

Wash, dry and chill the salad greens thoroughly. Cut first two salad greens crosswise, in half-inch pieces. Break the curly endive into small pieces, and cube cucumber in half-inch pieces. Toss all together in salad bowl with Spanish dressing. Serves four.

Spanish Dressing

3-4 cup French dressing
1-2 clove garlic
1 hard-boiled egg yolk sieved
1 1-2 tbsp. Worcestershire sauce
1-4 tsp. chili powder
Dash onion juice, dash celery salt

Blend all ingredients thoroughly or shake together in tightly-covered jar.

Nectar Dressing

3 tbsp. white cream cheese
2 tbsp. honey
1-2 tsp. grated orange rind
4 tsp. lemon juice
1-2 tsp. salt
Dash of cayenne
3-4 cup salad oil

Mix cheese thoroughly with honey and seasoning. Whip in lemon juice and salt. Beat in oil. Continue beating until it thickens. Chill before serving.

Basic Mayonnaise

1-2 tsp. salt
1-4 tsp. sugar
Dash white pepper
1-2 tsp. dry mustard
3-4 cup oil
1-4 cup vinegar

Shake until well blended.

For sea food salads, variations are possible from a French dressing or mayonnaise base. Add either 1-4 cup tomato ketchup, 12 large stuffed chopped olives, or 4 1-2 tablespoons finely minced anchovies to 1 cup dressing.

Household Hints

Pot-holders are easy to make and are a nice gift for the bride, mom or grandma.

EASIER WASHING

A new dishwashing detergent now on the market is said to remove lipstick and hard-to dissolve greases—without scrubbing—from glass, porcelain enamel, and other smooth, non-porous surfaces.

SAFETY TIP

Stick pins in the cork of any medicine bottles that may contain poison to prevent taking a dose by mistake.

The United States Department of Agriculture has just issued a bulletin, AIS 48 "Home Freezing of Fruits and Vegetables," which offers detailed instructions in the preparation of various products for freezing, sealing and storage. It can be obtained through state agricultural colleges or county and home demonstration agents.

CLEANING YOUR JEWELRY

Fine jewelry with important gems like diamonds, emeralds and sapphires, mounted in precious metals like gold, platinum or palladium, can easily be cleaned by brushing with soap and water to which a few drops of ammonia have been added.

WAX STAINS ARE REMOVABLE

Wax stains from the holiday candles are not difficult to remove according to Dorothy Threlkeld, specialist in clothing at the University of Kentucky College of Agriculture and Home Economics. Gently scrape the stain to remove the excess wax, then remove the paraffin spot by placing it between two unused blotters or layers of material and press with a warm iron. Finally, sponge the spot with carbon tetrachloride, a non-inflammable cleaning fluid.

Cut flower stems in varying lengths to avoid arrangements that look stilted.

When wearing a fur coat, exercise care in carrying parcels as they may rub and wear the fur.

THE MODERN FARMER

VOL XX. NASHVILLE, TENN., MAY 15, 1947 No. 4

U. S. Negro Agricultural Adviser To Liberia Returns To States

President Truman Says—

"During the war the Victory Gardeners made a magnificent contribution to the food production which was an important factor in winning the war. Food is still one of the most vital weapons in securing a lasting and stable peace. Farmers and Victory Gardners of America must make every effort to help provide the additional food that is so sorely needed. The deep satisfaction that these food producers will receive from helping to relieve the critical starvation conditions abroad will be an additional reward for their extra efforts."

"A continuing program of gardening will be of great benefit to our people. In addition to the contribution gardens make to better nutrition, their value in providing outdoor physical exercise, recreation and relaxation from the strain of modern life is widely recognized. The Department of Agriculture through a long-time garden program can do much to encourage more attractive home surroundings and improved community development, and can provide a large body of citizens with much needed assistance in home gardening."

Objectives of the National Garden Conference

Paul C. Stark

Director, National Garden Program

This conference has **two main objectives:**

1. **To re-mobilize the Victory Gardeners** of the war years so that a maximum production will be obtained from city, suburban, town, and farm home gardens, thereby aiding in making more food available for the relief of starving people in Europe and Asia. The 1946 Victory Garden program is an essential part of President Truman's Famine Emergency Program.

2. **To consider the benefits of a broad, continuing program in gardening,** including home and community improvement, both urban and rural.

You are taking part in an historic conference, the task before you is no small one. Its success, both the immediate one of helping over 18 million Victory Gardners get back on the job, and the long-time one of laying a basis for a permanent garden program, will depend to a large degree on your ideas and your recommendations. During the war this country showed the world what a democracy can do. Let us now show the world that we are equally capable of handling in a big way some of the problems of the Peace. I know that a lot is expected of you in these few brief days we are meeting here together but you are seasoned garden leaders. You have gained during the war years the ability to cope with tough problems and get them done with dispatch.

For our part, I am sure that the national leaders, representing both private organizations and agencies, and those representing government, who will address you here today and tomorrow will give you ideas, and facts that will be helpful to you in your deliberations in your working committees. I feel that this National Garden Conference will be a history-making one, and one that as time goes by, you will consider as being a momentous occasion.

Make County 4-H Club Members Learn Thrift

Raleigh, N. C.—Wake County 4-H Club members representing eleven of the County's fifteen 4-H Clubs crowded the Negro Mechanics and Farmers Bank Saturday, February 15, beginning at 11:00 a. m. to open up savings accounts as a result of accumulations from their projects. County 4-H teacher sponsors and adult 4-H community leaders accompanied their group in cooperation with the movement. The 4-H boys and girls opened up their savings accounts with from One to Fifteen Dollars and with the spirit of hope of seeing their accounts grow as they continue project work in the 4-H Club program. Aside from many club members adding to their accounts already established, thirty-five new accounts were opened up with the total running close up to Three Hundred Dollars.

Rides Bicycle

William Jones of the Sandy Fork 4-H Club got an early start on his bicycle, riding over lonesome country roads to U. S. Highway No. 1 where he stormed heavy traffic to reach the scene at 10:00 a. m. one hour ahead of schedule. When asked if other members of his club were planning to come, he said, "Yes, they are planning to come but I was so anxious to open up my account I got my bicycle and started to Raleigh so I would be on time."

$2361.17 On Savings

With the 4-H Thrift Program only fifteen months old the 4-H boys and girls of Wake County have $2361.17 to their credit in Raleigh and Wake County Banks and in War Stamps and Bonds. The bank accounts and stamps and bonds are in their own names and many of the 4-H Club boys and girls are using their thrift practices to educate their elders. Theo. Hodge, adult 4-H Club community leader of the Riley Hill section, who was present with his group said, 'If this is good for our children it is good for us, so I am going to open myself an account right now." Mr. Hodge was assisted in making out deposit slips and he stood patiently in line with 4-H Club members until his turn at the window.

Banking Officials Cooperate With Movement

Prior to the beginning of the 4-H Thrift Program, cooperative

U. S. Agricultural Adviser Returns from Liberia

CHARLES E. TROUT, of Alabama Extension Service, who returned recently from Liberia after serving there for over two years as agricultural adviser to the Liberian Government, is greeted by M. L. Wilson, director of Extension Service of the U. S. Department of Agriculture. Trout, who stands at left, has been appointed editor of the Negro Farmer, an Alabama Extension SeSrvice publication.

Farm Tenancy Lowest In Over Half A Century

The number of tenant and sharecropper farmers is lower now than in well over half a century, say U. S. Department of Agriculture statisticians who have been analyzing preliminary census data for 1945. These data show that only 32 per cent of the farmers were in the classification of tenants in 1945 as compared with 42 per cent in 1940.

Total tenants and croppers numbered only 1,858,000 in 1945; in 1930 they numbered over 2,500,000. Most of the big drop came during the war years when the rise in farm income—due in part to higher prices of farm products and in part to off farm employment—enabled many tenants to buy land.

Over half the decrease in farm tenancy took place in the South. In this region there was a drop of 280,000 tenants and croppers between 1940 and 1945. However, the South still has the largest number of farms operated by ten-

Negro Farmers Triple Yield In Ga. Corn Demonstration

Several colored farmers in Georgia tripled their corn yield last year by following the recommended practices of their county agents in carrying out a demonstration, P. H. Stone, State Agent for Negro work, reports.

The farmer-demonstrators got a yield of 42.6 bushels per acre while the average for their counties was only 13.5 bushels per acre, says Stone. Also, the demonstrators saved money on production costs, he reports. Because of the high yield, their corn costs them only 89 Cents per bushel to produce. The average costs per bushel for the State of Georgia as a whole was $2.19 per bushel.

Cotton Loan Rate

Next year's Government loan rate on cotton is fixed at 92.5 per cent of parity as of August 1, 1947. During 1946 the loan rate for Alabama producers ranked from 24.38c to 24.72c for middling 15-16 inch staple.

Invaluable Information Gathered In Africa To Be Given U. S. Farmers

Washington, D. C., April 7, 1947—Charles E. Trout of the Alabama Extension Service has returned to the United States from West Africa after serving for over two years as agricultural adviser to the Liberian Government.

Upon his return a week ago, Mr. Trout made an official report on his work to the Extension Service of the U. S. Department of Agriculture. In his report he pointed out that during his stay in Liberia, the country increased the appropriation for agricultural work by nearly 700 per cent.

Mr. Trout says that when he went to Liberia in 1944, the country was appropriating only $6,000 a year for agricultural work. After he had been there a year, the appropriation was increased to $20,000; and last year the government increased it to $40,000. Also, the number of experiment stations was increased from six to 13. And Mr. Trout reports that plans are under way now to construct a large modern central station to replace some of the smaller ones.

Measuring the value of his work in terms of the people, Mr. Trout says that through demonstrations, he and his assistants succeeded in getting the farm people there to produce more rice and grow more gardens.

With the help of three students, he developed a large garden in Monrovia, capital of the country. From this garden vegetables were sold at a curb market in the city. He points out that immediately the people saw that growing a garden not only meant more food for home use, but it also meant more extra cash. Now, Mr. Trout says, there are many gardens in Monrovia and in the hinterlands.

Before going to Liberia, Mr. Trout, who was a county agent in

Secretary Of Agriculture Anderson Asked Is U. S. Headed For Sideline?

"What will the United States be like a hundred years from now? Will the people be prosperous—well-fed—with plenty of nutritious milk, meat, fruits and vegetables for a balanced diet? Will they be more vigorous than we are—healthier— longer-lived? Or weaker— sickly— aging and dying before their time?" asked Secretary of Agriculture Clinton P. Anderson in an address last week before the Fourth Annual Oklahoma Save The Soil Clinic, Oklahoma City, Oklahoma.

Much of the answer, he said, is wrapped up in the future of American agriculture. There is a saying: "Tell me what you read and I'll tell you what you are." We can paraphrase that: "Tell us of our farms and we'll tell you of our Nation."

The story of soil exploitation begins about three and a half centuries ago, when the white man's plow first broke American sod. . . The plow that broke the plains loosened the dust cloud as well. And as the dust storms boil up in the West and carry across the Mississippi, and the Ohio, and the Alleghenies, and the Atlantic seaboard, we find that our account with Nature's bank of soil is marked "O. D." Overdrawn. . . .

Wise leaders suddenly see that the tired and worn-out countries sitting exhausted along the sidelines of history are our counterpart in the ancient world. Once they too had stood strong and vigorous, but they allowed their land's life to ebb out in the red and yellow and black rivulets, just as we were permitting ours to do. And so we begin to take stock of the results of soil and forest abuse. . . .

(Continued On page 2 Col. 1)

Make County 4-H Club

(Continued From Page 1)
arrangements were worked out in company and agreement with D. H. Keck, Assistant Cashier, to the level of making small deposits possible in order to reach a greater number of 4-H boys and girls. J. E. Strickland, Cashier and also representing the Banking Institution, offered a Five Dollar cash prize at the Annual 4-H Club Achievement Day to the 4-H Club boy or girl having deposited the highest amount of money on savings over a twelve months' period. The prize was won by Thaddis Horton of the Apex 4-H Club who had Three Hundred and One Dollars on savings.

The 4-H Thrift Program is under the direction of W. C. Davenport, Negro County Agent; Mrs. Bertha Edwards, Negro Home Agent; Miss Allene Brannon, Assistant Home Agent; and, Enos Evans, Assistant Negro County Agent.

Secretary of Agriculture

Continued from page 1)
Already more than half our farmland has been seriously injured. . . Each year erosion is estimated to cost the country close to Four Billion Dollars.

In 1935, Congress passed the Soil Conservation Act which established the Soil Conservation Service and recognized soil erosion as a national problem. In 1936 the Agricultural Conservation Program began . . . For the United States, as a whole, through the middle of last month, more than one thousand seven hundred and fifty soil conservation districts had been organized, covering almost a billion acres and roughly three-fourths of the Nation's farms and ranches. . .

In short, though we have nearly one hundred million acres under complete soil and water conservation treatment, mostly in soil conservation districts, and though three hundred and sixteen million acres are carrying out one or more ACP practices, agriculture is still a long way from the permanent protection we must have for our remaining productive land. This year, less than half the acreage required to grow such infertilled crops as corn, cotton and soybeans, will be adequately protected . . . There is no question as to our choice. We must CHOOSE abundance and we must learn to live with abundance. The only question is whether we are fully aroused to the job. . . How CAN we wage total war against land destruction?

It seems to me that among our needs we must include the completion of our national land capabilities survey and our soil mapping program, so that the grower, without the expense of a personal experiment, can find out just how intensively he can afford to use each field and how much protection it needs to keep it permanently productive. . .

Curb Market Sales Provide Cash for Home Improvements

A long-time dream of a better home with running water and electric lights is coming true for many colored farmers in North Carolina, says R. E. Jones, State Agent for Negro Extension work.

In a report received this week by the U. S. Department of Agriculture, Jones points out that by growing a year-round garden, raising extra chickens, hogs, and producing more eggs and butter to sell at the curb markets which have been established by county agents in several towns and cities, many farm people are earning extra cash to repair, remodel, and improve their homes. He says that a few have added electric lights and running water.

Sales Manager: "You give me a pain in the neck."

Salesman: "Thanks for moving me up."

Invaluable Information

(Continued From Page 1)
Tuscaloosa County, Ala., developed a large curb market in Tuscaloos. Through this project, he attracted national attention to his work and was subsequently selected by Extension Service for the Liberian assignment.

Mr. Trout brought his family back with him. They joined him in Liberia about a year and a half ago. It is understood that he will not return to Liberia. Aware of the need of a qualified person to succeed him upon his return here, Mr. Trout began training an assistant early in 1945. This assistant will assume full charge and carry on the program.

Mr. Trout has been appointed to a position in the State Office at Tuskegee for Negro agricultural extension work in Alabama. In his new post he will edit THE NEGRO FARMER, monthly farm journal published by Alabama Extension Service.

Farm Tenancy Lowest

(Continued From Page 1)
ants.

The South also had the largest gain in the number of owners, which increased 14 per cent in this region. Colored owners in the South increased from 173,000 to 186,000. In the North and West the increase in the number of owners was very slight. In these two regions there was an increase in the size of farms rather than in the number of farms.

The gain in owners in the South came largely from an increase in the number of farms of less than 10 acres. Many of these farms are situated near the larger industrial centers of the South where the housing shortage has forced some urban workers to move farther out and become rural residents.

Because their plots are in excess of three acres, the census classifies them as farms. Department officials point out that this increases the percentage of owners and makes for a corresponding decrease in tenancy. They say that if farms of less than 10 acres were omitted in the agricultural census, the percentage of tenants in the South would be higher.

Milk Brings Cash

Nearly 13,000 farm families in 15 Tennessee Valley counties sold $4,504,000 worth of milk and milk products during 1946. Milk delivered to chees plants at Admore, Boaz, Cullman, Decatur, Scottsboro and Russellville on 95 milk routes accounted for the greater part of this income.

Dairy Records

Dairymen who do not keep individual production records usually feed all the cows in the milking herd the same amount of feed, say API extension dairymen. This overfeeds the low producers and underfeeds high producers.

Turkeys Add to Family Income

Mrs. Allen Cook of Woodland Community, Perry County, says that raising turkeys for the past two years has meant money to her and the family. Her income from turkeys last year was $396.

Last spring she started with 53 poults and raised 48 of them. These poults were raised with the turkey hen. They were fed mash and home grown feed. None of the turkeys had any disease.

During the months of November and December, Mrs. Cook sold 40 of the turkeys—a total of 782 pounds for $396. She said that her expense for feed and care was very little. She plans to go into the business on a larger scale this year.

4-H'ers Use Medicine Mans Tactics to Teach Farmers

If farmers will not come to a demonstration then take the demonstration to the farmers, that's the method employed by Negro County Agent D. G. Belton of Fairfield County, S. C., according to a report received by the U. S. Department of Agriculture from the South Carolina State Extension Service.

Well, it's cotton planting time in South Carolina. And County Agent Belton knows that if farmers don't treat their seed against parasitic fungi and bacteria, some of the diseased cottonseed may not germinate. Belton knows, too, that farmers not only need to be told to treat their cottonseed against fungi and bacteria, but they also need to be shown how to treat their seed.

Last Saturday he set up a cottonseed treatment demonstration in one of the busy parking lots of Winnsboro, S. C. He brought along two 4-H boys, Floyd English and John Coleman to demonstrate to farmers how to treat seed.

When farmers continued to pass by, paying little attention to the demonstration, County Agent Belton mounted the platform with a dozen photographs under his arm. Then, like a carnival barker, he began announcing his show. The announcement was followed by a pictorial presentation of livestock and poultry raising.

Attracted by the pictures, farmers came over to see what was going on. Then County Agent Belton had his 4-H boys present their cottonseed treatment demonstration. It worked. Over 100 farmers witnessed the demonstration, and a score of them asked questions. Belton plans to repeat this demonstration technique every Saturday.

Now Is a Good Time

Now is a good time to: (1) Repair and paint farm machinery, (2) Clear and clean up pastures, (3) Build and repair fences, (4) Prepare land for kudzu and sericea, (5) Cut stalks and leave them on the ground, (6) Build terraces.

Give Them Due Credit

It's human nature to complain when we can't get what we want when we want it. And that applies to railroad cars as much as to anything else. The enormous volume of rail traffic, coupled with the difficulty of obtaining new rolling stock, cause occasional car shortages. But, whether we kick or not, it's only intelligent to realize the exceptional job the lines are doing in the face of innumerable problems.

Frank P. Borden, Traffic Manager of the Douglas Fir Plywood Association—whose members are heavily dependent on the railroads to move their product—recently said this about the car problem: "Today the railroads are handling more cars per week than at any period during the war . . . This peacetime traffic is a lot harder to handle than wartime stuff. . . . Train-load traffic has been replaced by individual cars moving from every conceivable origin to every conceivable destination. Now the railroads are given credit for having performed miracles during the war, and yet, today they are moving more cars than they were moving then, and with less equipment, so aren't we witnessing a continuing miracle? I know it is painful where it hurts, in the pocketbook, when we can't get a car when we want it, but at least, instead of calling the agent an old so-and-so, we can give the railroads credit for doing a bang-up job."

The railroads have great quantities of equipment on order, and they are putting it into service as fast as it is delivered. They are making every car and every train perform the absolute maximum of service. They have plans for continuing expansion and improvement. No industry is doing a better job with what it has to work with. That is the virtually unanimous opinion of men who understand the reasons for car shortages—and also understand the problems attending railroad operation today.

The Pioneering Spirit

The El Dorado, Kansas TIMES, recently paid a well-deserved tribute to the oil industry. "One of the big oil companies originally produced just seven products," it observed. Through research, these seven products have risen to 1,069, and the list is still growing. These products mean the creating of thousands of new jobs, offering wider service to industry, agriculture and the home."

One of the typical characteristics of private enterprise is the speed and the flexibility with which it meets changing needs. Under the competitive system, it must be continually alert to the demands of consumers—or run the danger of losing its markets to a more enterprising producer. The oil industry is experiencing some very significant changes in product demand now. Distillate fuels are beginning to rival gasoline in demand, and surveys indicate that diesel power will increase fourfold in the railroads in the next ten years. Again, yet-propulsion fuels, new and extremely efficient insecticides made from oil, and now plasticizers for the plastic industry, are assuming an important place on the lengthening list of products which the country must have.

On the side of long-range planning, oil is not lagging behind. A revolutionary system of making synthetic gasoline from coal is well along in the experimental stage. If the anticipated success is realized, our potential sources of oil will be sufficient to last 3,000 years. Never in history has the industry devoted so much energy and money to research and new development. The pioneering spirit never goes out of free enterprise.

"Love letters should be written in invisible ink and mailed in the incinerator."—Sign in the office of the New York attorney-author, Louis Nizer.

Producing Milk Pays Black Belt Farmer

By J. R. OTIS

J. H. Pickett, Black Belt dairy farmer at Union Town, in Perry County, is one of the few college-trained men who turned to farming instead of other vocations.

He inherited a fine Black Belt farm on Highway 80, three miles east of Union Town. At first, like his father, he tried to make a living raising cotton. It did not take him long, however, to learn that boll weevils would not let him make a living from cotton on Black Belt land.

He noticed that his neighbors were turning to producing milk. So he tried milking cows for a living. To his surprise, he found that it paid so well that he didn't mind milking on Sunday. He accepted the invitation to attend a Black Belt Experiment Station meeting where pastures were discussed. There he learned that good pasture was the secret to low cost production of milk. Therefore, he set out to build good pastures. Now he keeps 15 to 20 milking cows, five dry cows, a bull and 12 calves and yearlings on 90 acres of land.

Pickett soon learned that his work could be lightened by using modern labor-saving equipment. So he bought a milking machine and increased the number of dairy cows. His work is now done quicker and with greater ease, and it doesn't matter so much if the hired man oversleeps on Sunday mornings.

As his business grew he found that the creamery paid him more for clean sweet milk than for dirty sour milk. He wasn't able to buy a commercial cooling tank. So he built a tank and used his windmill and a gas engine to pump water. He also built a concrete milking barn to help in keeping the bacteria count down. Then he began retailing milk and selling the surplus to the cheese factory.

Pickett's business grew from a gross income to $2000 per year to better than $6000 per year. His business is outstanding because he grew into it. He succeeded because it was in him to succeed and because he did not try to start at the top. One does not buy his way into the dairy business. If he is wise he will grow into the business as Pickett did.

A rather outstanding point about the Picketts is that they had a business before they had a beautiful home. Income from business supports desirable homes, but desirable homes don't add income to business. When the income of farmers is large enough to support good homes they are added naturally. Farmers can't have good homes without good incomes.

Four-H Club Girl Makes Good Record

Leola Pittman of the Graham Community, Randolph County, is doing some excellent 4-H club project work. In her home improvement projects, she has been busy making her home more attractive and comfortable.

First, Leola completed ceiling the kitchen. Then she painted the walls and ceilings of four rooms and papered the walls and ceilings of two others. She used bright colors in order to add light and beauty. She also planted flowers and shrubbery around the grounds.
